TAHOE:
STATE
OF THE
LAKE
REPORT
2023

Tahoe Environmental
Research Center

Today's Offering

1. Brrrr. It's cold! What's flippin' happening?
2. Anybody up for a day at the beach?
3. Microplastics are here, there and everywhere.
4. I'm sorry. We're all out of the shrimp special!
5. What has all this done to clarity?
6. What is the State of the Lake?

1. Brrr. It's cold! What's flippin' happening?

Sometimes called "turnover" or deep mixing

- ❖ November 2022 was the 3rd coldest month in 110 years.
- ❖ December 2022 was well below the long-term average.

Nearshore Algae are Generally Divided into Two Types

Periphyton

Metaphyton

2022 Periphyton Blooms were spatially extensive

Continuous images of entire shoreline can be quantified and categorized to determine spread

These were the worst metaphyton blooms ever observed

Kiva Beach, August 2022

Regan Beach, August 2022

The Connection between metaphyton and Asian Clams

2023 Launched a year-round, 5-pronged monitoring strategy

1. Drones – high resolution demarcation at specific sites

2. Helicopter – rapid, entire shoreline surveys, cross-correlated with drone data

3. Scuba Surveys – provide “ground-truthing”, biomass estimates

4. Citizen Science – to get the community providing data, potentially identifying new hot-spots

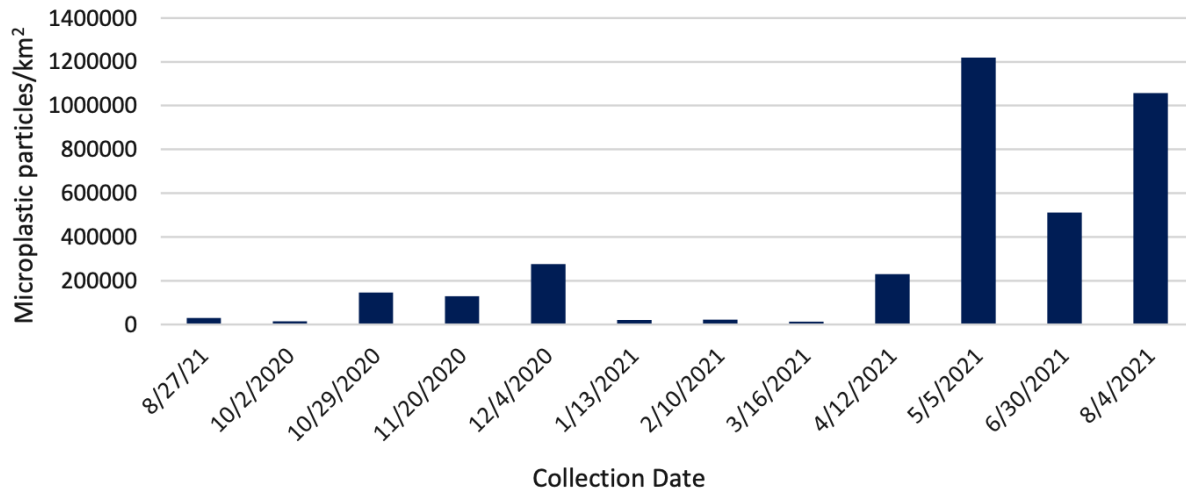

5. Nearshore Network of real-time sensors

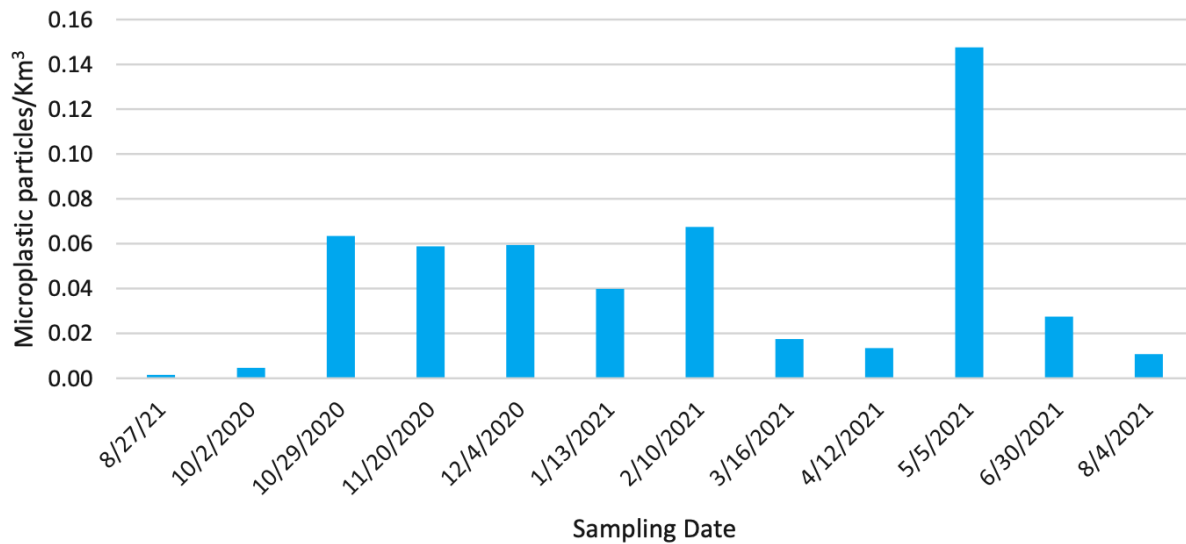

3. Microplastics are here, there and everywhere

Estimated Microplastic Abundance for Lake Tahoe Surface Water (0m)

Estimated Microplastic Abundance for Lake Tahoe Subsurface Water

Plastic Types in Surface Waters of Lake Tahoe

Polyethylene - most widely used plastic in the world, products ranging from clear food wrap and shopping bags to detergent bottles, car tires....

Polypropylene - plastic packaging, plastic parts for machinery and equipment, fibers and textiles.....

Lake Surface (0m)

Subsurface Water

Polyester – clothing, home furnishings, tires, bottles, sports equipment...

4. I'm sorry. We're all out of the shrimp special!

Biologically, Lake Tahoe displayed greater change in 2022 than in any year since year-round monitoring commenced in 1968, and much of it seemed to center on the introduced *Mysis* shrimp

Mysis Shrimp Population Abundance

A Chronology of Foodweb-Mediated Clarity Improvement

5. What has all this done to clarity?

How did the 2022 readings compare to the last 20 years?

August – December Secchi Depth at Tahoe the best since the 1980s

6. What is the State of the Lake?

- ❖ We do not provide a scorecard
- ❖ The current improvement in clarity is temporary – the *Mysis* will return, and with them the old clarity levels
- ❖ In 2022 the natural system taught us that clarity can change in a very short time. **What are the lessons we need to learn and add to current management strategies?**

Lesson 1. Measure more often

Lesson 2. Measure more places

Lesson 3. Measure smarter – using models to guide monitoring and experiments

Lesson 4. Do it all

When will we achieve all that?

Surprise!! We already have the
infrastructure in place
