CHPS and LEED are very compatible, with limited differences between the two programs. CHPS is self-certifying whereas USGBC is responsible for LEED certification. CHPS addresses acoustics, requires greater attention to on-site toxics and requires a higher level of energy performance. LEED includes several measures not in CHPS, including post occupancy requirements such as measurement and verification.[256] CHPS focuses just on schools. While there is currently no direct interchangeability between the CHPS and LEED rating systems, CHPS is working with the USGBC to develop a Memorandum of Understanding, which would formally establish the relationship between CHPS and the USGBC. Internally, the USGBC has

[256] Discussion with Charles Eley, Eley & Associates, March 26, 2003. See also CHPS Criteria. Available at: http://chps.net/manual/index.htm#vol3.

considered developing a LEED for schools application guide. However, much of this work has already been completed through the development of CHPS performance criteria. Establishing consistency between LEED and CHPS, perhaps with CHPS serving the basis for a national LEED for schools application guide, will help ensure these two complementary programs work together.

Green building and sustainability has also started to influence construction of higher education facilities. In early 2002, the Los Angeles Community College District Board of Trustees committed to a 25% renewable energy standard and adopted a minimum LEED Certified level target for future construction. They allocated $35 million of an overall budget of $1.2 billion, or almost 3%,[257] for green construction.

Most recently, in July of 2003, the University of California Board of Regents, informed in part by an early draft of this report, adopted a green building and clean energy policy for all future new construction on campuses system wide.[258]

It is worth noting that:

- 6.2 million children, teachers and administrators – one fifth of California's population – spend their day inside schools.
- Only 43% of high-volume chemicals have been tested for potential human toxicity, and only 7% have been tested for their effect on children's development.[259]
- Asthma is the leading cause of admission of urban children into hospitals and the leading cause of days absent from school.[260]

LEED Gold design can be expected to provide a significant level of protection against potentially toxic chemicals and against a rising incidence of asthma and allergies. Gold level green buildings typically achieve much higher levels of compliance with LEED IEQ enhancement measures than Certified or Silver buildings. This could include the use of low emitting materials for adhesives and sealants, paints, carpets, and composite woods as well as establishing indoor chemical and pollution source control. As noted in the productivity section, 13 Certified and Silver level green buildings reviewed achieved an average of about 55% of these LEED measures, while 8 Gold level LEED buildings achieved 88% of these credits.

This report recommends that higher education systems target the LEED Gold level, as it will likely be cost-effective to do so. Savings could be expected in energy, waste, and water, and – critically – substantial gains can be expected in student health and productivity.

[260] *Ibid.*

Several recent studies have begun to address the impact of high performance school facilities on student learning and teacher performance:

- As discussed earlier, the Heschong Mahone study examined student performance improvement on standardized tests for 22,000 students in 2000 classrooms in California, Colorado and Washington. Data from California schools (which is considered the most detailed) shows with a 99% statistical certainty that students with the most daylight progressed 20% faster in math and 26% faster in reading than students with the least daylighting.[261]
- A study of Chicago and Washington, DC schools found that better school facilities can add 3-4 percentage points to a school's standardized test scores, even after controlling for demographic factors.[262] This and other studies reviewed in the productivity section confirm a widely held, common sense perception that the physical quality of the classroom environment greatly affects how well children learn.
- An analysis of two school districts in Illinois, one small and one large, found that student attendance improved by 5% after incorporating cost effective indoor air quality improvements – regardless of school size (specifically, each site implemented the US EPA's IAQ Tools for Schools Program[263]).[264]
- A study of several Illinois schools found that 20% of teachers were averaging 4 days per year of sick leave due to IAQ problems.[265]

Green building improvements – especially for new buildings – appear to be very cost effective compared with other available measures to enhance student performance. Under the recently adopted Federal Education Bill, schools and states stand to lose billions of dollars in federal funding if students do not perform well on annual standardized tests. School and university systems should consider adopting whole building green design at the Gold level as a standard requirement in new school design and school retrofits.

Because the school market is relatively heterogeneous, it may be more difficult to quantify financial benefits to schools as compared to state office buildings. Additional research should address specific attributes of schools and university buildings to better refine estimates of financial benefits.

IX. Spotlighted Technologies and Methodologies

This section contains a brief review of the impact of three specific green building features or systems: commissioning, underfloor air distribution systems, and cool roofs. The energy, environmental and health benefits of these technologies and practices are included in the relevant sections above. However, one additional benefit of underfloor air – reduced cost of churn – is not accounted for elsewhere in this report, and is calculated below.

Similarly, commissioning benefits include reduced operations and maintenance (O&M) costs, a benefit not captured above and therefore calculated here. Commissioning is a process that ensures proper system design and installation, and reduces costs by eliminating errors. It is an important part of the integrated design approach and helps ensure that green building systems perform as expected. Since all LEED buildings include commissioning (it is a prerequisite) and are likely to include other measures that help address operations and maintenance issues, the O&M benefits of commissioning can be included in calculations of the full financial benefits of green buildings.

Commissioning, and Measurement and Verification

Commissioning – a methodology to ensure that building systems are installed and operated as planned – is an increasingly common practice.[266] It has been defined as the "process of ensuring that systems are designed, installed, functionally tested and capable of being operated and maintained according to the owner's operational needs." [267]

Commissioning is particularly important for green buildings, because they are expected to achieve better performance (e.g., low energy use, better air quality) than conventional buildings. LEED requires "Fundamental Building Systems Commissioning," which currently entails hiring a commissioning expert, developing a commissioning plan and completing a commissioning report. In addition, LEED provides credits for additional commissioning and for including a building performance measurement and verification program. The measurement protocol referenced in LEED, the International Performance Measurement and Verification Protocol [268] is also used internationally as a way to demonstrate CO2 reductions benefits, providing a potentially helpful way to secure financial value through sale of CO2 reductions associated with green buildings.[269]

Commissioning and green buildings share:[270]

- Use of a systems approach.
- Use of life cycle perspective.
- Greater attention to design.

Estimated cost of commissioning as a percentage of construction costs varies with building size and is typically viewed as a higher percentage for smaller buildings. However, there is evidence that resulting savings more than pay for the cost of commissioning for both green and non-green buildings. A recent report found that costs of commissioning, including travel expenses, range from 2% to 4% for buildings costing less than $5 million, down to 0.5 % to 1% for buildings costing over $50 million. The study used nine case studies to illustrate why savings from commissioning exceeded the cost of commissioning even before the projects were complete. Commissioning:[271]

- Helped eliminate costly change orders.
- Reduced requests for cost information.
- Helped ensure proper system/component selection.
- Improved performance of building systems.
- Reduced call backs.

Basic commissioning required for LEED costs even less. In six recent LEED office buildings and schools the average cost of "Fundamental Building Systems Commissioning" required for the LEED prerequisite was equal to 0.3 to 0.6 % of construction costs.[272]

The Portland Energy Conservation study cites cases – including a California commercial property and a California university building – in which commissioning led to identifying substantial design and operating problems, and opportunities for substantial savings.[273] Commissioning can also provide potentially significant insurance related benefits (see Section X).

LEED includes an additional credit for system metering. Detailed analysis of several hundred million dollars of energy building upgrades demonstrate that rigorous measurement and verification of energy and water efficiency and system retrofits tend to:[274]

- Increase initial savings level.
- Increase persistence of savings.
- Reduce variability on energy and water savings.

Commissioning and metering help ensure that buildings meet and maintain performance targets – including green performance targets. They make it easier to document and claim benefits in such areas as indoor air quality, productivity and emissions reductions. Improved metering allows building mangers to better manage upgrades and maintenance, helping to anticipate and avoid equipment failure, leaks and other costly operations and maintenance (O&M) problems.

Thus, commissioning and metering contribute to lower O&M costs, such as extended equipment life, though how much lower is not known. O&M costs in state buildings – $3,039 per person per year[275] or $12.25/ft^2/yr – are nearly an order of magnitude larger than energy costs. Therefore any reduction in O&M costs has a significant impact on financial benefits. For example, a reduction in O&M costs of 10% is equal to a savings of $304 per person, or $1.35/ft^2 per year. There is not enough data to estimate with any precision the reduction in O&M costs that would occur in green buildings. Clearly the reduction is larger than zero but probably under 25%. To be conservative, this report assumes that green buildings experience an O&M cost decline of 5% per year. This equals a savings of $0.68/ft^2 per year, for a 20-year PV savings of $8.47/ft^2.

Additional research on the O&M impact of green buildings is strongly recommended. Note that the reported savings in areas other than O&M appear to entirely pay for the cost of commissioning, so commissioning costs do not need to be deducted from the O&M-related financial savings.

Underfloor Air

It is estimated that underfloor or raised floor HVAC systems are used in 58% of new commercial buildings in Japan and half of new commercial buildings in Europe, but in only 10% of new commercial buildings in North America.[276] Only 2 of 21 green buildings reviewed included underfloor air,[277] the same percentage as conventional buildings, although there are strong indications that the use of underfloor air is rising in all US construction, and rising more rapidly in new US green building construction. Advocates of underfloor air cite a range of benefits relative to conventional overhead air distribution systems, including:

- Reduced life cycle building costs.
- Improved ventilation efficiency and indoor air quality.
- Reduced energy use.
- Lower cost of churn.
- Quieter working spaces resulting in greater occupant satisfaction.

Underfloor air is "an innovative technology that uses the underfloor plenum below a raised floor to deliver space conditioning in offices and other commercial buildings."[278] Typically this involves either a pressurized underfloor plenum with a central air handler delivering air through

[275] Data provided by the California Department of General Services, Real Estate Services Division, December 2002.

[278] Fred Bauman and Tom Webster, "Outlook for Underfloor Air Distribution," *ASHRAE Journal*, June 2001.

passive grills or diffusers, or a zero pressure plenum with air delivered though local fans in combination with a central air handler.[279] The most significant cost savings from underfloor air is the lower cost of "churn" – the cost of moving employees within buildings. There are also significant HVAC energy savings as demonstrated at the Block 225 building in the Capitol Area East End Complex in Sacramento.[280]

Underfloor air has been adopted less rapidly in the United States than some experts had anticipated, due in part to its newness as a technology, limited applicability to retrofit construction and perceived higher costs. Published costs for specific projects range from negative first cost[281] to $3/ft^2$ [282] and higher. The actual costs appear to be very dependent on when the underfloor air systems are integrated into building design and construction. In the case of the state of California's Department of Education building (Block 225 of the East End Complex), underfloor air was added late in the design process through a change order and ended up adding about $4 million to the total construction costs. Block 225 of the East End complex experienced construction costs of only 1.9% above conventional design due to green elements other than underfloor air.[283]

According to Oppenheim Lewis Inc., a well-respected construction cost estimating firm in the San Francisco Bay Area, underfloor air systems, when integrated from the start of design, cost *slightly less* than overhead systems. In these cases, the lowered costs of the architectural, mechanical, and electrical work more than offset the higher materials and installation costs. A more precise breakdown is presented in Figure IX-1 below:

Figure IX-1. Capital Cost Analysis of Overhead (conventional) Air Systems vs. Underfloor Air[284]

Cost Component	Overhead	Underfloor
Architectural Work	$17.00	$14.50
Raised Access Floor	$ N/A	$ 7.00
Mechanical Work	$16.50	$12.40
Electrical	$ 7.00	$ 6.00
Total Cost	**$40.50/ft²**	**$39.90/ft²**

Office Buildings, was undertaken by a team of six experts from Carnegie Mellon's Center for Building Performance and Diagnostics and the Oak Ridge National Laboratory.[285] The report surveys over 300 relevant case studies worldwide and selects the most rigorous of these. In nine studies with detailed cost estimates, underfloor air came with a premium of \$0 to \$3/ft^2, with one study showing a cost of \$6/ft^2 and two studies showing a cost of \$1 to \$3/ft^2.[286] The churn savings in this study range from \$1 to \$5 per square foot per move, or an annual savings of \$0.40 to \$2.00/ft^2/yr.[287]

The report finds that underfloor air typically provides energy savings in the range of 5% to 30% below conventional overhead systems, and provides measurable benefits in air quality, ventilation effectiveness and productivity. These attributes are part of why underfloor air is promoted in green building design. This section will focus on determining a reasonable and conservative estimate of the benefits associated with reduced cost of churn – a benefit not usually included in building design decisions. Estimating the churn savings from underfloor air can help quantify the full value of green buildings.

Churn Costs

The most significant cost savings from underfloor air is lower cost of "churn" – the cost of moving employees within buildings. As a recent valuable review of churn by Herman Miller describes, with underfloor air "floor layouts can be changed quickly, because power and cabling can be quickly relocated: and simple, easy to use furniture can be used because it does not need to carry large amounts of power and cabling."[288]

In 1995, a study by the International Facility Management Association (IFMA) of its 2200 members found an average churn rate of 35%. [289] This rate rose above 40% in 1997, with a churn rate of 48% reported for service and manufacturing companies.[290] Churn is generally higher for high tech firms and is likely to be lower for government agencies. In California state agencies, the frequency of costly "mass relocation from one building to another" is approximately once every 8 years [291] or 12.5% per year. There appears to be little hard data about churn rate within state buildings or for smaller, less costly, and very probably more frequent moves. In the absence of harder data on churn rate in government agencies, this analysis assumes an average churn rate of 30% for state of California employees, well below the IFMA reported industry average.

In the early 1990s, T.R.York found an average cost premium of \$2.29/ft^2 for underfloor air, but a churn savings of \$257 per year per employee from the greater ease of employee relocation.[292] A

[291] Data provided by the California Department of General Services, Real Estate Services Division, December 2002.

[292] T.R. York, "Can You Afford An Intelligent Building?" *FM Journal*, September/October 1993, pp. 22-27. Summarized in the Carnegie Mellon BIDS database: http://nodem.pc.cc.cmu.edu/bids/index.asp.

1996 study by Flack & Kurtz of an Owens Corning building found a $2/ft^2 first cost savings from raised floor cooling,[293] as well as $1.50/ft^2 in annual savings from the lower cost of churn.[294] DowElanco Corporation (a partnership between Dow Chemical Company and Eli Lilly) found the cost of relocating a workstation in an office with underfloor air to be $2.35/ft^2 compared with $20/ft^2 for hard walled offices.[295]

A more recent detailed examination was made of the Soffer Tech Office Building, a 64,000 ft^2 speculative office building constructed in Pittsburg. A study of this building shows churn savings significantly outweighing the additional costs of installing underfloor air. The combination of high performance design elements – a raised plenum with relocatable diffusers and relocatable wiring – cost $29.03/ft^2, or an additional $0.27/ft^2 over a conventional system, which would cost $28.76.[296] This represents a cost difference of less than 1% between a conventional overhead system and an underfloor air system.[297] The cost savings in of each reconfiguration is estimated at $4.66/ft^2, or about 7 times the initial additional capital cost of the high performance design. Assuming an average churn rate of 0.3 times per year (30% of office workers move each year) an annual churn cost of $1.86/ft^2 is avoided. This indicates a payback ($0.27/$1.86)– assuming a $0.27 initial capital cost increment – of under two months.

Another example of reduced churn costs is provided by the Pennsylvania Department of Environmental Protection. In one conventional office building they measured a cost of about $2,500 per move. (This churn cost is high and reflects the varying costs of moving.) In a new building with raised access flooring, underfloor air, and quick-disconnect manufactured power and teledata cabling, this cost dropped to approximately $250 per workstation, or 90% less.[298]

Conclusions

According to the IFMA 1998 Experience Exchange Report, the average cost of a move is $1063 per employee.[299] Other reports indicate a somewhat lower average cost of moving, reflecting varieties in the definition of moving. According to IFMA, a simple move to and from existing workplaces costs $173, a move including relocation of furniture costs $712 per move, and a move requiring construction costs $2100. Actual yearly moving costs are therefore dependent on what types of moves occur. The reported cost for moving a California state employee is $350, including phone line. Installation of a data line costs $200, so a simple move involving data line installation would cost $550.[300] Larger moves, especially involving construction, cost significantly more. State employees have a 12.5% rate of mass moves to other buildings (cited above), which would typically involve much higher costs, probably on the order of $1000 to $2000 per move. This limited data suggests move costs may be consistent with or somewhat less

than IFMA reported averages. Absent more specific data about California public employee move costs, estimated savings are $300 per move in a building with underfloor air compared with a conventional building. This estimate is very likely to be low.

Assuming a churn rate of 30% (discussed above), this implies an annual savings of $90 per year per employee, significantly below the estimated costs in other studies, such as those completed by Owens Corning and Ray Engineering.[301]

An average of 225ft^2 per employee implies an annual savings of $0.40/ft^2/yr ($90 per year for each employee's 225ft^2, or $0.40/ft^2/ year). This is significantly below the annual churn savings identified in the York and Souffer studies, and substantially lower than the DowElanco and Pennsylvania DEP estimated savings. This is also at the bottom of the range of the meta-study conducted by Carnegie Mellon/Oak Ridge, which identified average churn cost savings in the range of $0.40 to $2/ft^2/yr.[302] Based on a review of the range of case studies and existing data, this report therefore assumes a conservative value of $0.40/ft^2/yr per employee in reduced churn costs associated with underfloor air, with 20-year PV at 5% discount of $4.98/ft^2. This indicates that it is cost effective to install underfloor air in state buildings where the cost per square foot is less than $5.

Note that there is little data on churn costs in schools, so the above estimate should not be directly applied for schools. It is probable that churn is less frequent and/or less costly in schools, so churn reduction benefits of green buildings would be proportionally less. In the absence of good data, a reasonable estimate for churn reduction benefits in green schools might be about half that for state buildings, or a 20-year PV of $2.50/ft^2. For specific educational buildings such as laboratories and administrative offices, churn costs are likely to be higher. Lack of data indicates the need for additional research in this area.

Additional analysis is recommended to obtain more accurate estimates of frequency and cost of churn, with type of churn (employee-only/phone/rewiring/construction) indicated.

Urban Heat Island Reduction – Cool Roofs

Extensive studies conducted by Lawrence Berkeley National Laboratory (LBNL), the California Energy Commission and others have documented large energy and health benefits from lighter color roofs, lighter color paving and tree planting. Darker surfaces absorb more sunlight, increasing temperature within buildings, and creating "heat islands" and an associated need for air conditioning. More air conditioning requires greater consumption of energy, which in turn leads to the release of more pollutants. In addition to increasing their own temperatures, dark roofs and surfaces also raise the temperatures in surrounding areas, increasing their needs for air conditioning as well. Since 1950, increased absorption of sunlight by dark buildings, roads and loss of tree coverage have played a large role in increasing the average temperature of Los Angeles by about 1ºC every 15 years.[303]

---

[301] Conversation with Vivian Loftness, December 2002. Lead author of comprehensive meta study, complete citation above.
[302] V. Loftness et al., June 2002. Op. Cit.
[303] A.H. Rosenfeld et al., "Cool Communities: Strategies for heat island mitigation and smog reduction," *Energy and Buildings*, 28, 1998.

The medical cost of poor air quality in Los Angeles is about $10 billion per year, of which 70% is from particulates and 30%, or $3 billion, is from health costs due to ozone.[304] High temperatures are a primary condition for the creation of smog (ozone). By reducing ambient urban temperatures, heat island reduction directly contributes to reduced ozone creation, in turn reducing the large human health costs associated with smog. For the city of Los Angeles, there are numerous estimated benefits of a comprehensive cool communities program:

- Direct savings of $100 million in annual residential air conditioning costs (A/C needs reduced by 10% to 30% as estimated by various studies). [305]
- $70 million reduction in indirect cooling costs (reduced air conditioning for other buildings due to lowered ambient air temperature).[306]
- $360 million from reduction of smog (12% ozone reduction).[307]

Most of the impacts and benefits of heat island reduction measures have been very extensively modeled and documented by LBNL, utilities such as PG&E,[308] cities and other entities. For example, the Southern California Air Quality Management District undertook an independent evaluation of the benefits of urban heat island mitigation before accepting heat island reduction measures as a legitimate option to meet their strict regulations restricting smog. At the same time, not all the benefits have been fully modeled statewide. The values for direct avoided energy costs have been modeled most extensively, while the health benefit values are somewhat less precise since they have not been fully modeled for all of California.

Potential heat island savings (both air quality and energy) for Northern California have not been fully modeled, but LBNL Senior Scientist Hashem Akbari, a leading expert on heat island reduction, estimates that potential savings from cool roofs in Northern California are at least half that of Southern California. His conservative estimate is that total statewide savings from heat reduction measures are at least $750 million per year, with $500 million from health improvements and $250 million from reduced energy use.[309]

The installation of "cool roofs" on buildings provides both energy and health benefits by reducing heat islanding. The technology is presented here because:

1) The financial benefits for California are significant and well documented.
2) It is an important feature in green building design systems such as LEED (75% of 21 LEED green buildings reviewed achieved one heat island reduction credit and 50% achieved both).
3) Perhaps because it is so simple, it is sometimes overlooked when compared with higher tech solutions.

[308] PG&E. "High Albedo (Cool) Roofs: Codes and Standards Enhancement Study." 2000. Available at: http://www.newbuildings.org/downloads/codes/CoolRoof.pdf.

[309] Data provided by Lawrence Berkeley National Laboratory. October 2002. (Hashem Akbari). See also: http://www.coolroofs.org/.

Cool (high albedo) roofs – roofs that have high thermal emittance (high radiation of heat) and high solar reflectance (high reflection of sunlight) – stay cooler in sunlight. They are also easy to incorporate and have a number of direct and indirect benefits.

Cool roofs come in several forms, including:

- Roofs painted or otherwise covered in a highly reflective surface (of light or metallic color).
- Roofs shaded by neighboring trees, PV panels, etc.
- Green roofs, which are densely planted for high sunlight absorbance and insulation.

In a report issued in 2000, PG&E modeled the effect of cool roofs on the energy usage of 990 California commercial buildings. They found an average 20-year present value energy savings from use of cool roof materials of $0.37/ft^2 for the roof area (not the whole building), resulting from reduced air conditioning requirements.[310]

In addition to energy and heat island impacts, cool roofs also experience less expansion and contraction than dark roofs, which contributes to statistically significant extension of the roof life. Typically, cool roofs last 20% longer than conventional roofs. LBNL has calculated that financial benefits of longer roof life are roughly equal to the value of energy savings.[311] Combining the benefits of direct reduction in air conditioning with the value of a longer roof life provides an estimated 20-year PV of $0.75/ft^2.

As indicated above, the average statewide health value (principally from reduced smog creation) is twice that from direct reduced energy use, or about $0.70/ft^2 in direct health benefits. This report will count one half of the estimated direct health benefits from cool roofs, or $0.35/ft^2. Combined with benefits of direct reduction in air conditioning and longer roof life value (calculated above) of $0.75/ft^2, this provides an estimated 20-year PV savings from cool roofs of $1.10/ft^2 of roof surface. Additional benefits such as lower waste costs due to longer roof life and benefits of reduced temperature on surrounding buildings are not included in this analysis, tending to underestimate the financial benefits of cool roofs.

An additional benefit of cool roofs is that lower cooling demands can allow downsizing of air conditioning in buildings, providing an additional savings of about $0.10/ft^2 in capital costs. This is roughly offset by the additional cost of a cool roof, which is between $0.00 and $0.20/ft^2, though average marginal cost is below $0.10/ft^2.[312] This means that the $1.10/ft^2 value as calculated above can be considered a true 20-year NPV value, where additional cost is subtracted from overall benefits.

Because schools sometimes do not operate in summer months, some of the benefits, especially in reducing air conditioning load, are not achieved. This report conservatively assumes that schools see only 25% of the direct reduction in cooling costs, or $0.09/ft^2, and 50% of the health benefits ($0.35/ft^2). Because schools tend to be located in more wooded areas, roof-life extension benefits will be less, perhaps $0.28/ft^2, or 75% of the estimate for commercial buildings. This set of perhaps overly conservative assumptions indicates 20-year NPV benefits of $0.72/ft^2 for cool roofs on schools.

---

310 *Ibid*. Note that a 10 year life is assumed.
311 Data provided by Lawrence Berkeley National Laboratory. December 2002. (Hashem Akbari).
312 Data provided by Lawrence Berkeley National Laboratory. October 2002. (Hashem Akbari).

The large potential health and energy savings have resulted in the promotion of heat reduction measures by a number of organizations. This includes CEC incentives for application of cool roofs, incorporation of heat island reduction measures into the general air quality plans of the South Coast and Bay Area Air Quality Management Districts,[313] adoption of cool roofs in Title 24 as part of its non-residential perspective requirements, and inclusion of the following credits in LEED 2.1:

> Site credit 7.1 - 1 point for shade and/or reflectance and several other options.
>
> Site credit 7.2 - 1 point for energy star light colored/high reflectance roof with various restrictions added.

Despite the financial benefits and the inclusion of cool roofs in Tier 1 and CEC programs to support cool roof implementation, most new California state and school buildings are not built with them.[314] It seems clear that cool roofs and other urban heat island reduction measures are cost- effective and should be applied in new buildings.

To estimate benefits of urban heat island reduction measures for specific buildings, it is necessary to account for the number of floors. On a forty story building the average building-wide benefit of a cool roof is small. In contrast, the cool roof benefit of a one story building is relatively large. The average California state building has about 7 stories,[315] resulting in a cool roof NPV value of $0.15/ft^2 for the total building ($1.10/ft^2 of roof apportioned over seven stories, or about $0.15/ft^2 for the whole building). Note that school savings per square foot will be larger because schools typically have fewer floors. At an average of 2 floors per school,[316] the NPV benefits would be $0.36/ft^2 school-wide.

These estimates are almost certainly low. In addition urban heat island reduction measures other than cool roofs, including shading from tree planting and lighter surfaces surrounding buildings, such as parking lots, also reported to be very cost effective, but are not included in this study. A more thorough analysis should do so.

X. Insurance Benefits of Green Buildings[317]

Risk, and associated losses, is costly, with or without formal insurance. With conventional insurance, customer costs include deductibles, premiums and possible excess costs if the insured loss level is capped. If commercial insurance is not used, then the building owner is either formally or informally self-insured. Formal self-insurance implies that a distinct "premium" is paid from internal budgets and accumulated in the form of an earmarked loss reserve. If self-insurance is informal, then the risks are said to be "retained" and losses are paid from general operating budgets, without the creation of an anticipatory loss reserve.[318] Where formal or informal self-insurance is used, risk management is particularly important, since there is no hedge (upper limit) against loss costs.

Considerable untapped opportunities are suggested by the synergies between green-building technologies and risk management (Figure X-1).[319]

Figure X-1. Risk Management Benefits of Green Buildings

- **Worker Health & Safety.** Various benefits, including lower workmen's compensation costs, arise from improved indoor environmental quality, reduced likelihood of moisture damage, and other factors enhancing workplace safety.[320]
- **Property Loss Prevention.** A range of green building technologies reduce the likelihood of physical damages and losses in facilities.[321]
- **Liability Loss Prevention.** Business interruption risks can be reduced by facilities that derive their energy from on-site resources and/or have energy-efficiency features. This includes risks resulting from unplanned power outages.[322]
- **Natural Disaster Preparedness and Recovery.** A subset of energy efficient and renewable energy technologies make facilities less vulnerable to natural disasters, especially heat catastrophes.[323]

---

[317] Adapted from a report written by Evan Mills, Senior Scientist, Lawrence Berkeley National Laboratory. "Green Buildings as a Risk Management Strategy," December 2002.

[318] The basic difference between conventional insurance and self-insurance is that self-funded entities take responsibility for financing their own claims. The main advantages of self-insurance are: lower administrative costs, better claims control, meaningful claims statistics and potentially reduced losses through better loss control.

[319] Extensive discussion and references on the subject can be found at http://eetd.lbl.gov/ea/mills/insurance/cifram.html.

Available at: http://eetd.lbl.gov/insurance/LBNL-41432.html.

[321] Evan Mills, "The Insurance and Risk Management Industries: New Players in the Delivery of Energy-Efficient Products and Services," *Energy Policy* (in press), 2003. Available at: http://eetd.lbl.gov/emills/PUBS/Insurance_Case_Studies.html.

[322] J. Eto et al., "Scoping Study on Trends in the Economic Value of Electricity Reliability to the U.S. Economy," prepared for the Electric Power Research Institute, 2001. Available at: http://eetd.lbl.gov/ea/EMS/reports/47911.pdf.

Lawrence Berkeley National Laboratory has mapped approximately 80 energy efficiency and renewable energy measures onto specific "lines" of insurance benefited by their use.[324] A number of forward-looking insurers have supported energy-efficient and renewable energy technologies, including 52 insurers and reinsurers, 5 brokers, 7 insurance organizations, and 13 non-insurance organizations in this arena.[325] The approaches can be grouped into eight categories:

- Information, education, and demonstration.
- Financial incentives.
- Specialized policies and products.
- Direct investment to promote energy efficiency and renewables.
- Value-added customer services and inspections.
- Efficient codes, standards, and policies.
- Research and development.
- In-house energy management in insurer-owned properties.

While the list is impressive, it should be stressed that it reflects a small fraction of insurance companies. Most insurers and risk managers have yet to make the connection between green buildings and reduced risk. There are instances where insurance companies have offered premium credits on the order of 10% for insured parties implementing selected energy savings strategies.[326] Little has been done, however, to quantify or monetize the benefits.

A more specific characterization of the potential insurance benefits of green buildings is included in Appendix K, where benefits are mapped onto the credits of the LEED system (Version 2.0). This provides an analysis of the precise insurance-related issues and benefits for the full range of green building attributes. Each LEED prerequisite and credit is evaluated against seven types of risk – property loss; general liability; business interruption; vehicular; health & workers comp; life; and environmental liability, along with related comments. Of the 64 LEED points possible in Design Areas 1-5 (excluding the Innovation and Design Process category, which is non-specific), 49 (77%) are associated with measures that have potential risk-management benefits. A few of these, however, are potentially associated with potential adverse consequences – an issue that merits more attention in the green buildings community.

Insurance and Risk Management in California[327]

Currently, most general government facilities and operations in the state of California do not purchase commercial insurance. The majority of state buildings are informally self-insured. The Capitol building itself is uninsured, as are other well-known properties such as Hearst Castle.

[326] *Ibid.*
[327] Unless otherwise noted, the observations in this section are taken from conversations between Evan Mills and the California's Office of Risk and Insurance Management (Gary Estrada).

Construction on the Capitol Area East End Complex, the largest state government project in California history and the first state buildings to pursue LEED silver and gold ratings, is now complete. As it is bond-funded, commercial insurance is required. The Office of Risk and Insurance Management (ORIM) is not aware of any insurance/risk-related problems with this project, but subscribes to the notion that green buildings will have happier and healthier occupants.

ORIM is located under the Department of General Services (DGS) and is responsible for all risk and insurance activities in state government. For buildings and other facilities constructed with bond-generated funds, the state purchases property insurance but not liability insurance. In this case, deductibles are generally set high (currently $500,000 - $2.5 million) to minimize the premium. Under California's "Master Policies," there is approximately $1.5 billion of property at 15-20 locations that is commercially insured for property and liability risks, plus roughly $3 billion of additional property currently under construction.[328] Total premiums paid for commercial insurance were $18 million in 2000, of which perhaps 15% were for buildings.[329] The state's primary provider is Affiliated FM, which has, in the past, shown interest in energy efficiency as a tool of risk management.[330]

One of ORIM's most important initiatives at present is their "Owner-Controlled Insurance Program," under which the state buys Workers Comp, General Liability, and Excess Liability coverage for construction projects. Of relevance to the discussion of green buildings, evidence from closed-claims studies suggests that the associated risks can be reduced through the use of building commissioning,[331] and potentially result in lower premiums for the state. Commissioning (see Section IX) is one of the procedures called for in the LEED green building rating system. It is worth noting that state initiatives to promote alternative transportation solutions (one of the criteria of the LEED system) would result in fewer person-miles driven and corresponding reductions in the likelihood of vehicle-related claims.

Lastly, ORIM sees mold as a "growing" issue, and as a potential driver for more proactive risk management and holistic thinking about buildings. According to the Chief Economist at the Insurance Information Institute, most insurers report a tripling of mold-related claims in the last year. More than 9000 claims related to mold are pending the nation's courts, though most involve family homes.[332] A special program provides California state property insurance of $4-5 million for the single family homes of military veterans. While the vast majority of this is for earthquake and flood risks, mold issues have become a real concern in this program. Improved ventilation in green buildings is likely to combat mold problems. Many insurance companies have dropped all coverage for mold and IAQ. Although there are a few policies that cover mold losses, these have become very costly and the state has yet to purchase one.

---

[328] Insurance is discontinued once the bond is paid off.

XI. Conclusions

This report has sought to define, document and analyze the costs and financial benefits of green buildings. It has attempted to identify gaps in current knowledge about green building costs and benefits and to identify recommended areas of future research and analysis.

The financial benefits estimated in this report are a measure of financial benefits to the state of California as a whole, rather than to specific building tenants or owners. While a government entity should care about the benefits their building may have for society, a private commercial entity may not. Private sector building owners, for example, may be less likely to care about health and environmental impacts, and hence might perceive lower financial benefits of building green. In addition, because of higher capital costs and hurdle rates, future financial benefits are discounted more heavily by private entities than by public ones, potentially further reducing the perceived value of future green building financial benefits for the private sector. These differences help explain the significant disparity between public and private sector adoption of green building design.

This report began with an aggregation of data on actual or modeled costs for 33 green buildings. Largely derived from several dozen conversations with architects, developers and others, the data indicates that the average construction cost premium for green buildings is almost 2%, or about $\$4/ft^2$ in California, substantially less than is generally perceived.

The body of this report focused on determining the financial benefits of a range of green building attributes, with the findings summarized below.

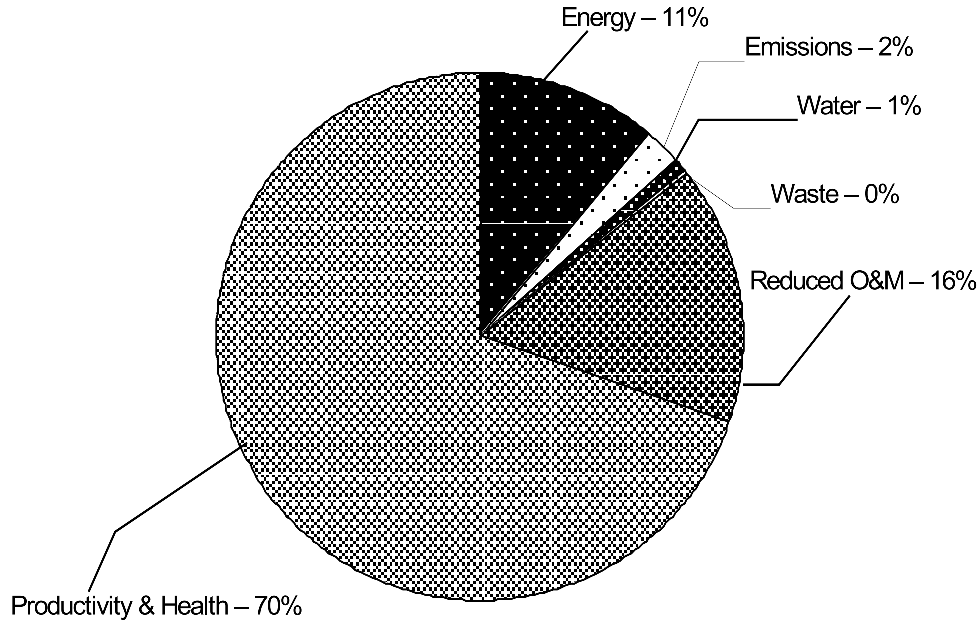
Figure XI-1. Summary of Findings (per ft^2)

Category	20-year NPV
Energy Value	$5.79
Emissions Value	$1.18
Water Value	$0.51
Waste Value (construction only) - 1 year	$0.03
Commissioning O&M Value	$8.47
Productivity and Health Value (Certified and Silver)	$36.89
Productivity and Health Value (Gold and Platinum)	$55.33
Less Green Cost Premium	($4.00)
Total 20-year NPV (Certified and Silver)	**$48.87**
Total 20-year NPV (Gold and Platinum)	**$67.31**

Source: Capital E Analysis

The relative percentages of the different benefit categories are shown in Figure XI-2 below.

Figure XI-2. Percentage Breakdown of Green Building Financial Benefits (LEED Certified and Silver Buildings)



Source: Capital E Analysis

The above pie chart is for Certified and Silver buildings. For Gold and Platinum buildings, a larger portion of benefits are represented by productivity and health, and the percentages of benefits from the other categories reduce correspondingly. The relatively large impact of productivity and health gains reflects the fact that the direct and indirect costs of employees are far larger than the costs of buildings and energy, so even small increases in employee productivity translate into large benefits. Note that this estimate does not include the financial benefits of reduced moving costs (churn) associated with underfloor air distribution systems because most green buildings do not currently use them.

As summarized above, total financial benefits of green design are estimated to be almost $50/ft^2 for Certified and Silver level green buildings, and over $75/ft^2 for Gold and Platinum level buildings. This is over ten times larger than the average 2% cost premium – about $3-5/ft^2 in California – for the 33 green buildings analyzed.

The financial benefits of green buildings include lower energy, waste, and water costs, lower environmental and emissions costs, lower operations and maintenance costs, and savings from increased productivity and health. These benefits range from being fairly predictable (energy, waste, and water savings) to relatively uncertain (productivity/health benefits.) Energy and water savings can be predicted with reasonable precision, measured, and monitored over time, so much so that commercial firms contract to buy streams of future energy and water savings. In contrast, productivity and health gains are much less precisely understood and far harder to predict with accuracy. This is due in part to the complexity of human health and performance issues, the large range in human reactions to indoor environmental quality changes, and the large range of ways that improvements can show up, including lowered insured or uninsured health costs, lower employee turnover or increased productivity.

There is now a very large body of research, reviewed in this report, which demonstrates significant and causal correlation between improvements in building comfort and control measures, and worker health and productivity. However, these studies vary widely in specific measured correlations. Further, there has been relatively little work completed to evaluate specific, measurable benefits from green building design in California in such areas as sick days, health costs, turnover and respiratory impacts such as asthma and allergies. Clearly, the benefits are significant and not zero, but the data supports a broad range of calculated benefits – in contrast to the more precisely measurable energy and water savings.

The financial benefits conclusions in this report should therefore be understood in this context. Energy, waste, and water savings and emissions reductions can be viewed as fairly precise, reasonably conservative estimates of direct benefits that alone significantly exceed the marginal cost of building green. Health and productivity benefits may be viewed as reasonable, conservative estimates within a large range of uncertainty that therefore justify additional research to better quantify and capture the associated benefits. These studies might include such measures as evaluating green building effects on insured and uninsured health effects, employee turnover, worker well being and, where relevant (e.g. in schools), test scores.

Schools are also an ideal application for green building. One-fifth of California's population spends weekdays in schools. Productivity and health are critically important, not just for the well-being of students and teachers, but also in order to enhance the learning environment and student performance. Some green building benefits (e.g., reduced cost of churn) are less relevant for school buildings. However, as discussed in the above *Note on Education*, children's increased vulnerability to toxic chemicals, allergens and other pollutants is a particularly compelling argument for green schools. Green buildings – especially at the Gold level – provide a significant degree of protection against potentially toxic chemicals that can lead to a rising incidence of asthma and allergies. The strong correlation between children's test scores and daylighting illuminates the large benefits available from greener design. Despite uncertainties about benefits of green design in schools, due to limited data and the large range of school building designs, this report concludes that green design up to LEED Gold level is now very cost-effective for school buildings.

There are additional benefits not evaluated in this report. As one example, the recent book *Small is Profitable*, identifies 207 benefits associated with use of distributed generation and energy efficiency,[333] only a few of which are reflected in this report. A range of other potentially significant benefits from building green include reduced medical costs from a healthier work/study environment and avoided school revenue losses due to higher student attendance. Additional studies should evaluate these and other potential benefits. Similarly, there are a few areas of potential health-related costs associated with green buildings. In particular, there is the possibility of higher indoor concentrations of pollution from lower air exchange rates, which are sometimes associated with more efficient buildings. This is addressed in LEED through reducing introduction of pollutants and toxics and enhanced ventilation. These issues should be examined more fully in a future analysis.

Constructing green buildings cost-effectively requires integrated green building design and a careful commissioning process. The commonly higher initial cost of green design and construction can be expected to drop as designers and builders gain experience in building green. The benefits of green buildings are greatest for public entities that have explicit responsibility to be concerned about broader societal benefits such as health.

---

[333] See: http://www.smallisprofitable.org/. Op. Cit.

There are a number of areas that warrant additional research to refine our understanding of the costs and financial benefits of green buildings. The following section includes a list of over thirty specific areas for recommended additional research.

Faced with limitations in available data, this report has attempted to make consistently conservative assumptions, and found that the financial benefits of green buildings are approximately ten times larger than the average additional cost of building them. Further research and analysis of areas of potential additional benefits would refine costs and benefits estimates (and probably increase estimated financial benefits). Despite gaps in data and analysis, the findings of this report point to a clear conclusion: building green up to the LEED Gold level makes financial sense today.

XII. Recommended Next Steps

After the general section, recommendations are grouped by category, in alphabetical order, followed by recommendations for research on private sector buildings.

General

1) *Fund Optimized Design.* Green buildings may be more complicated and more expensive (especially when including energy modeling and commissioning) to design than conventional buildings. Ensuring adequate resources for integrated design, use of charettes, modeling, etc., is critical to the construction of cost-effective green buildings. Money spent in the early design phase ensures future financial benefits and optimized building performance. The state should try to understand how to optimize the design process and ensure adequate resources for the early design phase in California green buildings. In doing so, the state should build on work completed by Eley & Associates, Natural Logic and others on performance-based fees – providing a better understanding of the most effective allocation of fees to different phases of the design process. This would allow more cost-effective and fair compensation for all participants including clients and the design team.

2) Support and participate in a more refined evaluation of the cost-effectiveness of adopting a LEED Gold level target for state buildings and academic institutions. Consider whether green building benefits can offset budget limitations, such that operations and productivity savings prevent an increase in expenditures. This could include mapping LEED Gold level points onto financial benefits and other targets specific to the state of California.

3) Evaluate the cost-effectiveness of adopting California's *LEED Supplement for California State Facilities*. Research should address whether additional elements need to be added (e.g., higher minimum energy reduction or peak demand reduction targets).

4) *Baseline Data Collection.* The state does not maintain easily retrievable data about standard design practice for its building projects and generally does not evaluate and catalogue building performance over time. Both of these endeavors are important to gain an accurate understanding of the full value of green building strategies.

5) Identify information sources and tracking mechanisms for green building cost data that are closer to the actual projects, instead of potentially biased second and third-hand sources. This might include obtaining construction records and original estimates, developing a transparent method of interpreting the cost data, and including an explanation of that method with the findings.

6) Support analysis and development of recommendations for the most cost effective policies to promote adoption of green buildings in California.

7) Analysis of data on California and public buildings should be expanded and updated in late 2003 to reflect a growing body of LEED submissions and other data available since this report analysis was undertaken (October-December, 2002). This expanded analysis should identify trends and provide additional cost and financial benefit insights related to green building elements and additional areas of benefits.

Commissioning

8) Support ongoing commissioning efforts at DGS. Encourage evaluation of the cost-effectiveness of commissioning in new non-green buildings as well as advanced commissioning in green buildings in California.

9) Support work to develop a commissioning template, including a checklist of recommended/required commissioning steps that are most important and cost-effective. The checklist could focus on ensuring environmental and health benefits.

10) *Maintenance.* Green buildings provide greater health, productivity, and/or enhanced learning and other benefits than conventional buildings. Green buildings also emphasize the importance of maintenance and periodic planned preventative commissioning. Additional work should be done to develop an approach to improved building maintenance, especially for green buildings, that maintains building benefits and also meets California state budgeting requirements. The cost-effectiveness of periodic re-commissioning as well as improved durability and ease of maintenance of green products and systems should also be examined.

Emissions

11) This paper roughly assumes an "Average California Emissions Factor" (ACEF) approach to quantify cost of emissions from electricity generation. However, a more detailed analysis would look at variations across electricity generators, and assign greater benefit to reducing consumption from the dirtiest sources.

12) Emissions calculations generally cover only pollution at time of generation. However, considerable emissions are created during extraction/production, purification, and other steps in energy life cycle as well. A more thorough analysis would include these. See Appendix E.

13) *Financial Impact of Reduced Non-Fossil Fuel Electricity Generation*. Explore impact of emissions and/or other environmental costs associated with nuclear (16% of California generation) and large hydro (20% of CA generation).[334]

14) Reductions in V

15) olatile Organic Compounds (VOCs), mercury and other emissions from building materials, office machines, nearby traffic and other sources may have significant value but are not explicitly calculated in this preliminary report. A fuller report should quantify the benefits of these reduced emissions including operations and maintenance benefits and the incidence and costs of human productivity and health effects. Specifically, estimate reductions of indoor levels of carcinogens in green buildings and use cancer cost estimates (developed by US EPA) to calculate resultant economic benefit.

16) *Indirect effect of building siting on transportation:* Future work should explore this impact of inappropriate siting of buildings in light of the dominant influence of vehicle emissions on outdoor air quality in California, lost productivity due to gridlock, loss of agricultural land resources, and the growing importance of exposure to high levels of pollutants on or near roadways.

---

[334] California electricity generation profile: http://www.green-e.org/your_e_choices/ca.html, April 2003. Data compiled by US Environmental Protection Agency.

Energy

17) *Better Understanding of the Potential of Green Building to Cut Peak Electric Load.* This is an important and largely overlooked issue and it is recommended that additional work be undertaken to more accurately value green building peak demand reduction.

18) *Leased Properties.* The California state government leases one third of the commercial buildings it occupies and provides building performance guidelines to the renting firms. [335] It appears that there is no formal cost analysis for the incorporation of these "green lease" guidelines. Analysis should be done to determine the cost-effectiveness and plausibility of requiring that leased space be green.

    Rising energy costs have a significant impact on the profitability of leasing agencies and therefore on the availability and cost of properties for lease to the state. In 2001, nine of California's eleven real estate investment trusts (REITs) underperformed the market average. One reason for this is California's high energy costs. A survey of California REITs found that for office properties, energy costs amounted to 9.5% of their net operating income, the highest portion for any of the building classes reported. This reflects both high energy costs and lower operating margins for office buildings, underlining the potential value of greater energy efficiency in state-leased office properties.[336]

    Additional work should be undertaken to evaluate the impact of greening on leased properties, including: value of buildings, lease rate impacts, and net operating impacts for the state.

Insurance

19) *Better Quantification of the Insurance-related Benefits of Green Buildings.* The minimal use of commercial insurance in California means that data must be collected from less formal agency-level sources, which may or may not be available. Efforts could be focused on analyzing insurance loss data (often referred to as "data mining") for a broader market, and extrapolating the results to California state-owned buildings and to educational institutions. Specifically, the impact on insurance premiums of reduced mold liability through the construction of moisture resistant buildings, improved quality control of construction and improved maintenance, should be examined.

20) Develop a resource for state risk managers and other decision makers, catalog what is known about the risk and risk-management aspects of green building technologies (expanding on the list of 80 technologies prepared in 1998 for DOE).[337]

21) Use state's purchasing power to negotiate better insurance premiums for existing and future green buildings, e.g., lower premiums for liability insurance under the "Owner-Controlled Insurance Program."

[337] The DOE database is available at: http://eetd.lbl.gov/insurance/welcome.html.

22) Identify adverse interactions associated with green building technologies and create corresponding risk-management/reduction protocols to mitigate the risks. A common example is concern over adverse linkages between energy efficiency measures and indoor air quality or moisture problems. Whether real or perceived, these "downside" aspects are a significant barrier to the acceptance of innovative green building strategies. Relay the results to the CEC's Public Interest Energy Research (PIER) Program so that they are better addressed in the state's major energy-efficiency R&D efforts. Current research efforts in the PIER program are attempting to more precisely determine this relationship.

23) Participate in the next Risk Management Conference (sponsored periodically by the California Office of Insurance and Risk Management). Other relevant venues are the Public Agency Risk Mangers Association (PARMA) [338] meeting for state risk managers and the national public sector insurance meeting of Public Risk Management Association (PRIMA).[339]

Productivity and Health

24) Support a team in gathering more data about productivity issues. A study of green buildings might include the measurement of thermal comfort parameters and application of better monitoring – with quality control measures. Other data that could be gathered include: absenteeism, overall satisfaction, health symptoms, and school test scores.

25) Because productivity and health gains can be the dominant benefits of green buildings, more work should be done to assess and expand upon the findings of this report. A greater sensitivity should be paid to variances between specific cases, with error bars attached to benefits to show nominal and worst case conclusions. Consider supporting R&D to develop a set of predictor considerations for what factors specifically impact productivity.

26) California should consider participating in Seattle's "human factors commissioning" database project, which is measuring the impact of greening on worker comfort, health, productivity and related measures for all new or renovated municipal buildings that meet or exceed the LEED Silver level.[340]

27) Expand upon CBE analysis aggregating data from state buildings on:

    - Occupant satisfaction.
    - Absence rates.
    - Number of days actually sick.

    This might involve evaluation and measurement of ventilation rates, pollutants, human output, comfort, absence and sickness in green office buildings. A baseline could be selected (newer, nicer buildings) from the EPA database survey of 100 office buildings.[341]

[341] The "EPA Base Study" measured IAQ parameters and collected data on occupant health symptoms (via questionnaires). William Fisk, Senior Scientist, LBNL, December 2002.

Residential

28) There is no national consensus definition and guide for green residences. Participate in the development of a LEED residential application, including evaluation of cost-effectiveness of applying LEED for residences (including low income housing) with a focus on improving health.

Schools

29) Identify a senior-level state expert on schools to help lead an effort to evaluate the value that a LEED schools application guide might have for California. This would build upon and be coordinated with CHPS.

Water

30) *True Marginal Cost*. Currently available full cost estimates for new water supplies are inadequate. The state should commission a study that re-examines this issue and includes all of the considerations discussed in this document. Any new study examining marginal cost should also consider the marginal cost numbers used by water agencies in their grant applications for Proposition 13 funds. These were scheduled to be submitted to DWR in December 2002.

31) *Impact of Conservation*. The value of a conserved acre-foot varies depending on a range of factors, including: the alternative uses for the conserved water, the location of the conserved water, and timing of the conservation.[342] These factors ought to be examined more closely in any future investigation of value of conserved water.

32) *Cost of Conservation*. Analyze the cost of implementing conservation measures to determine their cost-effectiveness.

Waste

33) *California Environmental Data.* While the Massachusetts report[343] is quite comprehensive in its approach to environmental costs and benefits, its conclusions may or may not be appropriate for the state of California. A comparable California-specific study should be conducted.

34) *Economic Data*. While the UCB and NRC/REI reports provide significant insight into the economic impacts of diversion and disposal in California, they do not evaluate the following important areas: the actual retail price of C&D diversion vs. disposal in all regions of the state, the value to the state of recycled vs. virgin building materials, and cost to the building owner of implementing an office recycling program.

35) *Value of Enforcing Current Ordinances*. Determine the result of meeting current California waste reduction guidelines (Exhibit C – Tiers 1 & 2). Determine the cost to state agencies of implementing recycling and other waste reduction practices.

Research Opportunities for Private Sector Benefits of Green Buildings[344]

- *Increased Rent and Lower Vacancy*. Green buildings are more comfortable and healthier for building occupants, in addition to supporting increases in productivity. Therefore they should be in greater demand than conventional buildings: achievable rents should be higher and vacancies lower. A study that tracks green buildings in the marketplace could confirm or deny this.
- *IRR Case Studies*. Owners need more case studies on the internal rate of return (IRR) of green buildings. The San Diego Ridgehaven building is a good example – showing a 57% IRR on investment. [345]
- *Faster Tenant Lease-Up*. With higher press attention and greater tenant value, it is likely that green buildings will lease-up faster than non-green buildings. If proven, it could demonstrate substantial financial savings to the user.
- *Green Appraisals*. Very few appraisers understand green buildings and their benefits, including potentially increased income, lower expenses, and lower future liability. The state could meet with a few of the largest appraisal firms and discuss the impact of green buildings on their business.

Appendices

Appendix A: The LEED System[346]

LEED provides four award levels based on the number of environmentally related points achieved by a new building project. The four levels include: Certified (26-32 points) Silver (33-38 points), Gold (39-51 points) and Platinum (52-69 points).

LEED Version 2.1		
Design Area 1	**Sustainable Sites (14 Points possible)**	
	Prereq 1	Erosion & Sedimentation Control (Required)
	Credit 1	Site Selection (1 point)
	Credit 2	Urban Redevelopment (1 point)
	Credit 3	Brownfield Redevelopment (1 point)
	Credit 4.1	Alternative Transportation, Public Transportation Access (1 point)
	Credit 4.2	Alternative Transportation, Bicycle Storage & Changing Rooms (1 point)
	Credit 4.3	Alternative Transportation, Alternative Fuel Vehicles (1 point)
	Credit 4.4	Alternative Transportation, Parking Capacity (1 point)
	Credit 5.1	Reduced Site Disturbance, Protect or Restore Open Space (1 point)
	Credit 5.2	Reduced Site Disturbance, Development Footprint (1 point)
	Credit 6.1	Stormwater Management, Rate and Quantity (1 point)
	Credit 6.2	Stormwater Management, Treatment (1 point)
	Credit 7.1	Landscape & Exterior Design to Reduce Heat Islands, Non-Roof (1 point)
	Credit 7.2	Landscape & Exterior Design to Reduce Heat Islands, Roof (1 point)
	Credit 8	Light Pollution Reduction (1 point)
Design Area 2	**Water Efficiency (5 Points possible)**	
	Credit 1.1	Water Efficient Landscaping, Reduce by 50% (1 point)
	Credit 1.2	Water Efficient Landscaping, No Potable Use or No Irrigation (1 point)
	Credit 2	Innovative Wastewater Technologies (1 point)
	Credit 3.1	Water Use Reduction, 20% Reduction (1 point)
	Credit 3.2	Water Use Reduction, 30% Reduction (1 point)
Design Area 3	**Energy & Atmosphere (17 Points possible)**	
	Prereq 1	Fundamental Building Systems Commissioning (Required)
	Prereq 2	Minimum Energy Performance (Required)
	Prereq 3	CFC Reduction in HVAC&R Equipment (Required)
	Credit 1	Optimize Energy Performance (1 to 10 points)
	Credit 2.1	Renewable Energy, 5% (1 point)
	Credit 2.2	Renewable Energy, 10% (1 point)
	Credit 2.3	Renewable Energy, 20% (1 point)
	Credit 3	Additional Commissioning (1 point)
	Credit 4	Ozone Depletion (1 point)
	Credit 5	Measurement & Verification (1 point)
	Credit 6	Green Power (1 point)

[346] See: www.usgbc.org.

Design Area 4	**Materials & Resources (13 Points possible)**	
	Prereq 1	Storage & Collection of Recyclables (Required)
	Credit 1.1	Building Reuse, Maintain 75% of Existing Shell (1 point)
	Credit 1.2	Building Reuse, Maintain 100% of Shell (1 point)
	Credit 1.3	Building Reuse, Maintain 100% Shell & 50% Non-Shell (1 point)
	Credit 2.1	Construction Waste Management, Divert 50% (1 point)
	Credit 2.2	Construction Waste Management, Divert 75% (1 point)
	Credit 3.1	Resource Reuse, Specify 5% (1 point)
	Credit 3.2	Resource Reuse, Specify 10% (1 point)
	Credit 4.1	Recycled Content, Specify 5% p.c. or 10% p.c. + 1/2 p.i. (1 point)
	Credit 4.2	Recycled Content, Specify 10% p.c. or 20% p.c. + 1/2 p.i (1 point)
	Credit 5.1	Local/Regional Materials, 20% Manufactured Locally (1 point)
	Credit 5.2	Local/Regional Materials, of 20% Above, 50% Harvested Locally (1 point)
	Credit 6	Rapidly Renewable Materials (1 point)
	Credit 7	Certified Wood (1 point)
Design Area 5	**Indoor Environmental Quality (15 Points possible)**	
	Prereq 1	Minimum IAQ Performance (Required)
	Prereq 2	Environmental Tobacco Smoke (ETS) Control (Required)
	Credit 1	Carbon Dioxide (CO2) Monitoring (1 point)
	Credit 2	Ventilation Effectiveness (1 point)
	Credit 3.1	Construction IAQ Management Plan, During Construction (1 point)
	Credit 3.2	Construction IAQ Management Plan, Before Occupancy (1 point)
	Credit 4.1	Low-Emitting Materials, Adhesives & Sealants (1 point)
	Credit 4.2	Low-Emitting Materials, Paints (1 point)
	Credit 4.3	Low-Emitting Materials, Carpet (1 point)
	Credit 4.4	Low-Emitting Materials, Composite Wood
	Credit 5	Indoor Chemical & Pollutant Source Control (1 point)
	Credit 6.1	Controllability of Systems, Perimeter (1 point)
	Credit 6.2	Controllability of Systems, Non-Perimeter (1 point)
	Credit 7.1	Thermal Comfort, Comply with ASHRAE 55-1992 (1 point)
	Credit 7.2	Thermal Comfort, Permanent Monitoring System (1 point)
	Credit 8.1	Daylight & Views, Daylight 75% of Spaces (1 point)
	Credit 8.2	Daylight & Views, Views for 90% of Spaces (1 point)
Design Area 6	**Innovation & Design Process (5 Points possible)**	
	Credit 1.1	Innovation in Design: Specific Title (1 point)
	Credit 1.2	Innovation in Design: Specific Title (1 point)
	Credit 1.3	Innovation in Design: Specific Title (1 point)
	Credit 1.4	Innovation in Design: Specific Title (1 point)
	Credit 2	LEED™ Accredited Professional (1 point)

Twin Valley Elementary[2]	Elverson, PA	School	2004	1.50%	Level 2-Silver
Licking County Vocational[2]	Newark, OH	School	2003	1.80%	Level 2-Silver
3 Portland Public Buildings[1*]	Portland, OR	Office	since 1994	2.20%	Level 2-Silver
Nidus Center of Science[1]	Creve Coeur, MO	Office	1999	3.50%	Level 2-Silver
Municipal Courts[1]	Seattle, WA	Office	2002	4.00%	Level 2-Silver
St. Stephens Cathedral[12]	Harrisburg, PA	School	2003	7.10%	Level 2-Silver
4 Times Square[6]	New York City	Office	1999	7.50%	Level 2-Silver
PA DEP Southeast[2]	Norristown, PA	Office	2003	0.10%	Level 3-Gold
The Dalles Middle School[10]	The Dalles, OR	School	2002	0.50%	Level 3-Gold
Dev. Resource Center[8]	Chattanooga, TN	Office	2001	1.00%	Level 3-Gold
PA DEP Cambria[2]	Ebensburg, PA	Office	2000	1.20%	Level 3-Gold
PA DEP California[2]	California, PA	Office	2003	1.70%	Level 3-Gold
East End Complex-Blk 225[7]	Sacramento, CA	Office	2003	6.41%	Level 3-Gold
Botanical Garden Admin[9]	Queens, NY	Office	2003	6.50%	Level 4-Platinum

1 Cost data from "Resource Guide for Sustainable Development in an Urban Environment: A Case Study in South Lake Union, Seattle, WA," prepared by UEI, Oct 22, 2002, p.42. http://www.usgbc.org/Resources/research.asp. Note that many of these 33 data points typically came from more than one source and/or were checked with more than one source.
2 Cost data from presentation and discussions with John Boecker, Vice President, L. Robert Kimball & Associates, November 20 and December 20, 2002, and May 2003.
3 Cost data from Anthony Bernheim, "Saving Resources," Urban Land, June 2001 and Anthony Bernheim and Scott Lewis, "Measure and Cost of Green Building," presented at the AIA National Convention, May 2000.
4 C. C. Sullivan, "Off-the-Shelf Ecology," Building Design & Construction, May 2001, pp 57-60.
5 Communication with David Gottfried, WorldBuild, December 27, 2002, forwarded information from Craig Greenough, DPR Inc.
6 Communication with Pam Lippe, Environmental Consultant to the Durst Organization, Dec 19, 2002.
7 Cost data from Jim Ogden, 3D/I, "Summary of Green Building Costs - Block 225," 2003.
8 Communication with Randy Croxton, Croxton Collaborative, November 20, 2002.
9 David Kozlowski, "Urban Green," Building Operating Management, December 2001. Indicated cost increase 5-8%.
10 Communication with Heinz Rudolf, Principal, BOORA Architects, November 2002, June 2003. Bill Harper, Assoc. Principal, BOORA Architects, May, 2003. For more info, see: http://www.energy.state.or.us/school/highperform.htm
11 Communication with Kevork Derderian, Continental Offices Ltd., Nov 21, 2002.
12 Communication with Vern McKissick, Architect, McKissick Asssociates. May become gold, but silver for now.
* Without more complete information than that the buildings were completed between 1994-2001, the three were attributed to 1997 in this analysis.

Appendix D: Non-energy Value of Peak Demand Reduction

Below are updated numbers for 11 utility studies on the value of peak demand reduction in lowering T&D and related costs. The result is an average current value of $600/kW for peak power demand reduction. These savings can be realized with peak-shaving energy efficiency improvements and/or the installation of on-site distributed generation, such as solar photovoltaics.

A first set of studies from six utilities (Georgia Power, Florida Power & Light, Green Mountain Energy, New Mexico, and two from Southern California Edison), analyzed by Zaininger Engineering and presented in Figure D-1, indicate an average T&D-related benefit of $549/kW (2002 dollars).

Figure D-1. Non-energy Benefits of Peak Reduction/kW[347]

	Georgia	FPL	Green Mount.	New Mexico	So Cal Ed 1*	So Cal Ed 2*	CA Avg. (*)	Average of all 6
Environmental Externalities					$414	$634	$524	
Distribution facility deferral	$0	$0	$0	$1,033	$227	$0	$113	$210
Distribution Losses	$76	$55	$73	$18	$65	$265	$165	$92
Voltage Regulation	-$5	-$4	-$2	-$4	-$5	-$5	-$5	-$4
Transmission Capacity	$105	$0	$244	$0	$344	$107	$226	$133
Transmission losses	$39	$0	$0	$0	$46	$54	$50	$23
TOTAL NON-ENERGY BENEFITS	$215	$51	$315	$1,048	$677	$421	$549	$454
As % of generation capital cost ($600/kW)	36%	9%	52%	175%	113%	70%	92%	76%

The second set of data are from studies undertaken at five utilities (including two at Southern California Edison in California) and indicate average T&D and line loss benefits of $673/kW (2002 $), or about 110% of the current cost of marginal generation peaking plants.

Figure D-2. Non-energy Value of Peak Reduction[348]

	APS	COA	SRP	PG&E*	SMUD*	CA Avg. (*)	Average of all 5
Losses	$218	$95	$85	$89	$0	$45	$98
Distribution	$780	$18	$637	$62	$172	$117	$334
Transmission	$445	$0	$153	$548	$65	$306	$242
TOTAL NON-ENERGY VALUE	$1,443	$113	$875	$699	$237	$468	$673
% of generation capital cost ($600/kW)	241%	19%	146%	117%	39%	78%	112%

348 Howard Wenger, Tom Hoff & Dale Furseth, Pacific Energy Group; Christy Herig, National Renewable Energy Laboratory; John Stevens, Sandia National Laboratory. Data assembled by US DOE. Personal communications with study co-author Tom Hoff, November, 2002, CPI inflation adjusted.

Appendix E: Emissions

Some Assumptions
a) This report focuses on four pollutants: NOx, SO2, PM10 and CO2. While other pollutants impose significant costs and should be evaluated in a more thorough study, these four pollutants probably represent most of the damage from burning fossil fuels. Further research should analyze the value of reducing all emissions, including the waste products of nuclear reactors, which supply 16% of California's power.[349] This report also focuses on electricity and leaves out the cost of using gas in state buildings, both because gas represents a small percentage (<5%) of energy use in commercial buildings and because pollution from gas is well within the range of pollution intensity for the statewide mix of electricity sources.

b) California imports between 20% and 35% of its power (at peak) from out-of-state and this is roughly twice as dirty as in-state generation.[350] Of 50,000 MW total in-state generating capacity, only 500 MW, or 1% is generated from coal. However some 2000 MW of LADWP power that is sold in California is from coal burning power plants located out-of-state.[351] Emissions factors developed by Tellus were used in this analysis because these include out-of-state emissions. (See Section V.)

c) Emissions calculations generally cover only pollution at time of generation. However, considerable emissions are created during the extraction/production, purification and other steps in energy life cycle as well. For example, a recent PhD thesis at the Harvard School of Public Health estimated that a substantial portion of the damaging emissions from natural gas actually occur during extraction and production phases (that is, prior to combustion), but that these emissions are generally not included in calculation of emissions costs associated with energy production. See Figure D-1 below.

Figure E-1. Air Pollutant Emissions from Natural Gas Fuel Cycle (ton/ft^3)[352]

Stage	NOx	SOx	Total PM	CO_2
Extraction/ Production[a]	8.5×10^{-8}	1.4×10^{-6}	1.9×10^{-9}	3.3×10^{-6}
Purification[b]	4.1×10^{-8}	5.4×10^{-12}	1.6×10^{-10}	-
Power plant combustion	1.2×10^{-7}	1.7×10^{-9}	3.5×10^{-9}	6.2×10^{-5}
TOTAL	2.5×10^{-7}	1.4×10^{-6}	5.6×10^{-9}	6.6×10^{-5}
End-use fraction of total	0.49	0.0013	0.63	0.95

[351] Data provided by the California Energy Commission, Systems Assessment and Facilities Siting Division. December 2002.
[352] Jonathan Levy, "Environmental Health Effects of Energy Use: A Damage Function Approach." Thesis submitted to the Faculty of The Harvard School of Public Health in Partial Fulfillment of the Requirements for the Degree of Doctor of Science in the Departments of Environmental Health and Health Policy and Management Boston, Massachusetts, May, 1999, Table 15. This report kindly provided by Bob Berkebile of BNIM.

These and similar studies indicate the need to evaluate the life cycle emissions impact of fossil fuel consumption in order to achieve a more accurate environmental accounting of emissions and costs. It is not within the scope of this study to do so, tending to underestimate the financial benefits associated with lower emissions from reduced issue of purchased electricity in green buildings.

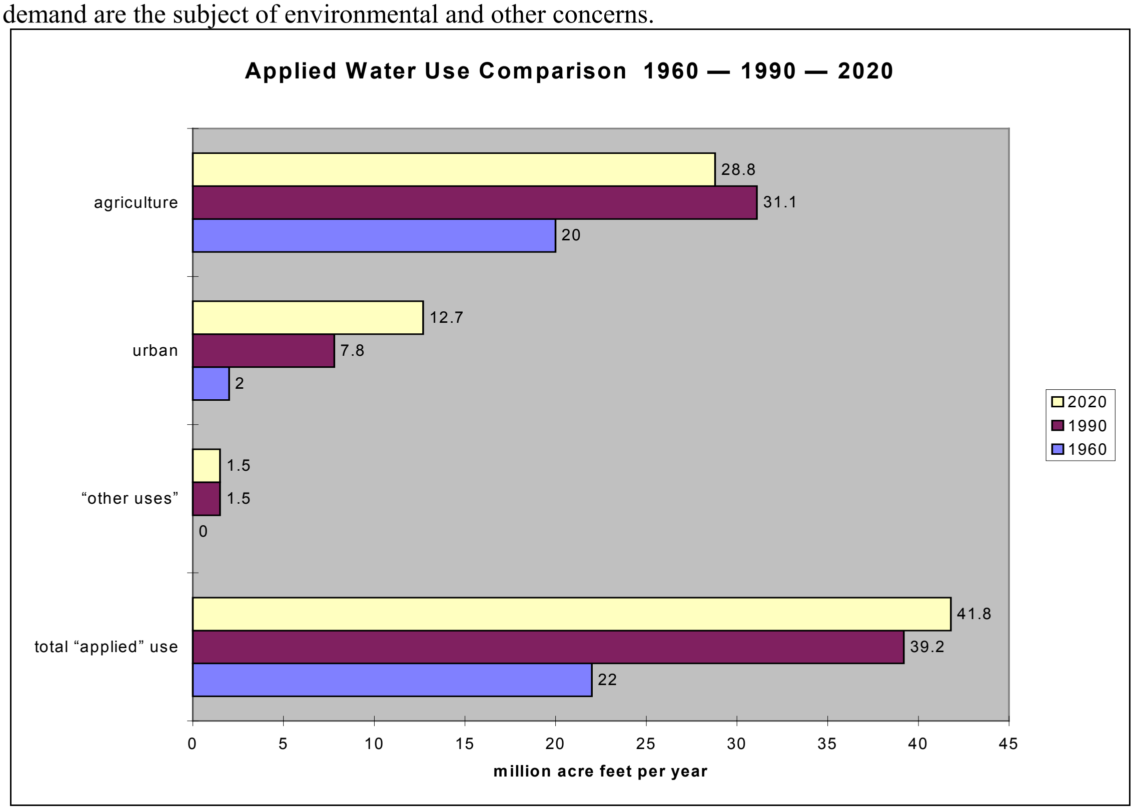
Appendix F: Water Use in California

The following is excerpted and adapted from the work of Bob Wilkinson, UC Santa Barbara.[353]

Water in California is extracted from natural systems primarily for use in the urban and agricultural sectors. The urban water use sector includes residential, commercial, industrial, and institutional uses, as well as municipal uses such landscaping and fire-fighting. As the state's population continues to grow, urban uses of water are steadily increasing. The state now projects a continued decline in water use for agriculture. Land retirement, crop shifting, water transfers, and improved efficiencies in irrigation as well as conveyance and management will all contribute to a reduction in water used for irrigation. Despite this decline, however, total extractions from the state's water systems have increased through the years, with flows for the environment decreasing as a result.

With very real limits to the state's water system, and every major supply source being reduced, the state's water systems may be fairly said to be stressed. Every major water supply source in California is currently beyond the physical or legal capacity to be sustained. California's entitlement to Colorado River water is 4.4 mafy, but it has been taking 5.2 mafy. An average of 1.3 mafy of groundwater extraction is overdraft (extractions exceed recharge by more than 18 percent). In severe drought years, this overdraft may be as high as four to 10 mafy, which drastically depletes economically recoverable groundwater resources.

The municipal and industrial (M&I) sector accounts for approximately 20% of the state's developed water use. The costs of water supply options have increased significantly, and water supplies to meet urban demand are the subject of environmental and other concerns.



* Total of "other outflow" and "environmental," a category which is not disaggregated for 1960. Assumes total water resources of 85 mafy for 2020, consistent with 1960 and 1990 data.

Source: California Department of Water Resources. California Water Plan Update, Bulletin 160-93, 1994.

[353] Robert Wilkinson, "Methodology for Analysis of the Energy Intensity of California's Water Systems, and an Assessment of Multiple Potential Benefits Through Integrated Water-Energy Efficiency Measures," January 2000, p. 16-17. (mafy = million acre-feet per year).

Appendix G: Water Calculations

Weighted Average Value (WAV) Calculation

Population data is based on projections from 1995-2020.[354]

	Total 20-year PV ($/af)	% of CA population	Component of WAV
Bay Area	$9,546	8.1%	$769.36
Central Coast	$5,576	3.9%	$216.24
Sacramento	$1,783	9.3%	$166.35
San Joaquin	$3,098	9.3%	$287.39
South Coast	$9,074	45.5%	$4,128.23
S. Lahontan	$4,837	8.5%	$408.93
Tulare	$3,200	10.1%	$322.71
	Weighted Average Value:		**$6,299.21**

For the following calculations, doubling this WAV number seems to make sense because of the numerous unaccounted for costs in the studies on which these numbers are based, as outlined in Section VI.

Value of Potential Water Savings – An Example

Determining the value of potential water savings in a typical new building project requires making multiple assumptions about the size of the structure, its intended use, and its location within the state and baseline design elements. For the purposes of this example, assume the following:

Building Size:	100,000 ft^2
Building Type:	Standard Commercial Office w/ Cooling Tower
Number of Employees:	400 (250 ft^2/employee)
Baseline Building Practice:	Code
Baseline Indoor Water Usage:	25 gallons per employee per day[355]
Use Reduction through Green Design:	30%[356]
Baseline Landscape Water Usage:	1.46 million gallons per acre per year[357]
Average size of landscaped area:	0.75 acres per building[358]

---

[354] Source: "Bulletin 160-98: California Water Plan," California Department of Water Resources, Table 4.1.

[355] The amount of water used in California's commercial buildings varies widely by building type and use. Cooling towers and restaurants have the greatest impact on consumption. Average daily per capita consumption ranges from 15 to 40+ gallons. From conversation with Dale Lessick, Irvine Ranch Water District, October 2, 2002.

[356] Indoor savings of 30% are considered typical when incorporating relatively simple green design features. Source: USGBC, http://www.usgbc.org.

[357] Landscape water usage is even more difficult to generalize than indoor use. Planted landscapes range in size from a few potted plants (mostly in urban centers) to several acres (mostly in the suburbs). In addition, plant types require vastly different amounts of water. From http://www.cimis.water.ca.gov/, the average ETo in California across all 18 zones is 51.6 inches per year. According to the CUWCC, typical turf grass requires roughly 70% of ETo – 36 inches per year. Assuming that water delivery systems, are on average 50% inefficient, this hypothetical turf grass would require 54 inches of water applied per year. Calculations: 4.5 ft^3 x 43,460 ft^2/acre x 7.48 gallons/ft^3 = 1.46 million gallons per year (mgpy). We assume that through more efficient irrigation systems and better plant selection, conservation can achieve a 50% water use reduction, resulting in a required application of 730 mgpy.

Use Reduction through Green Design:	50%[359]
Marginal 20-yr PV cost of water:	$12,598/af

Calculations:
(1 af = 325,851 gallons)

Indoor Water Conserved:
25 gallons x 30% = 7.5 gpd savings
400 people x 7.5 gpd savings x 260 work days/yr = 780,000 gpy (2.39 af)
2.39 af x $12,598/af = $30,109

Irrigation Water Conserved:
(1,460,000 gallons per acre x .75 acres) x 50% = 547,500 gpy (1.68 af)
1.68 af x $12,598/af = $21,164

Figure G-1. 20-Year NPV of Water Savings

Total Value Per 100,000 ft^2 Building		
Indoor	**Irrigation**	**Total**
$30,109	$21, 164	$51,271
Total Value Per ft^2 of Building		
Indoor	**Irrigation**	**Total**
$0.30	$0.21	$0.51

The PV values were calculated by multiplying the PV value of one acre-foot of water, as derived in Section VI, with the amount of savings (in acre-feet) that are achieved in this hypothetical example. The total 20-year PV for both Indoor and Outdoor water savings is calculated as follows:

PV of 1 af = $12,598	(from Section VI)
($12,598 x 2.39 af)	(savings from indoor water reduction)
+ ($12,598 x 1.68 af)	(savings from outdoor water reduction)
= $51,271	
$51,271 / 100,000 ft^2 = **$0.51/ft^2**	(20-year PV)

[358] Conversation with Dale Lessick. This is the average landscaped acreage of over 800 commercial buildings in the Irvine Ranch Water District.
[359] Outdoor landscaping savings of 50% are considered typical when incorporating relatively simple green design features. Source: USGBC, http://www.usgbc.org.

Appendix H: Value of Waste Reduction – A State Building Example

The following example shows the economic impact of C&D diversion in a hypothetical new state green building project. The calculated value is in downstream product manufacture and sales, real tax revenues, and environmental impacts. It is important to note that some of the assumptions in this calculation are based on values for curbside recycling. Due to the relatively higher quality of most C&D materials, C&D recycling is generally more financially beneficial than curbside residential or commercial recycling service. Ultimately, this is a calculation of the benefits of waste diversion, of which recycling is one part.

The Impact of Construction and Demolition Waste Diversion

Assumptions

Building Size:	100,000 ft^2
Construction Waste Generated:	200 tons (400,000 lbs) [360]
Demolition Waste Generated:	775 tons (1,550,000 lbs)
Baseline Case:	50% Diversion Rate[361]
Green Case:	75% Diversion Rate
Value of Ton of Diverted Waste:	
Output Impact:	$325/ton[362]
Income Impact:	$70/ton
Value Added Impact (taxable):	$111/ton
Environmental Impact:	$47/ton[363]
State Income Tax:	3%
State Sales Tax:	8.25%

Calculations

Full Value of Ton Diverted (Output + Environmental): $325 + $47 = $372
Tax Value of Ton Diverted: $2.10 (e.g.$70 x 3%) + $9.16 (e.g.$111 x 8.25%) = $11.25

Conclusions for the whole building, assuming additional 25% diversion over baseline

Construction Diversion		
Full Value:	$18,600	(200 tons x 25% x $372)
Environmental Value:	$2,350	(200 tons x 25% x $47)
Tax Value:	$563	(200 tons x 25% x $11.25)
Demolition Diversion		
Full Value:	$72,075	(775 tons x 25% x $372)
Environmental Value:	$9,106	(775 tons x 25% x $47)
Tax Value:	$2,180	(775 tons x 25% x $11.25)

[360] For nonresidential buildings: 155 lbs/ft^2 demolition waste, about 4 lbs/ft^2 construction waste. US Environmental Protection Agency Municipal and Industrial Solid Waste Division, Office of Solid Waste. *Characterization of Building-related Construction and Demolition Debris in the United States*. June 1998.

[361] Note: Statewide estimated overall diversion rate in 2002 was 48% (CIWMB) – and green buildings can often reach the 75% diversion threshold.

[362] Average Output Impact average from UCB and NRC study.

[363] The environmental cost number for California is probably similar to the environmental cost number from the Massachusetts study plus or minus 25%. A conservative estimate of 75% of the Massachusetts number is used here. This number is similar to the curbside recycling environmental value.

The savings of C&D waste diversion are presented in Figure G-1 below.

Figure H-1. Value of C&D Waste Diversion in 100,000 ft^2 Office Building

		Building	Per ft^2
Construction	**Full Value**	$18,600	$0.19
	Eco Value	$2,350	$0.02
	Tax Value	$563	$0.01
Demolition	**Full Value**	$72,075	$0.72
	Eco Value	$9,106	$0.09
	Tax Value	$2,180	$0.02

For construction on barren land, use only the construction values. For construction on already developed land where an existing structure must first be demolished, use the demolition values plus the construction values.

Which metric is the right one to use?

The most accurate number for the state to use when evaluating the value of waste diversion is the Tax Value[364] plus the Eco-Value, according to the following rationale. The Tax Value is the most precise and conservative metric. It represents actual revenue earned by the state as a result of diversion. The Eco-Value also represents real avoided cost to the state even if it is, in part, speculative (e.g., reduced green house gas emissions). The Full Value includes all the multiplier effects of diversion (e.g., income effects, product value effects, taxes, etc.) – many of which accrue to individual actors within the state, but not to the state itself.

Using this approach, then, the potential values for reaching a 50% C&D diversion rate (25% over baseline) are:

\$0.03/ft^2 or \$3,000 per 100,000 ft^2 building for construction only.

\$0.11/ft^2 or \$11,000 per 100,000 ft^2 building for demolition only.

\$0.14/ft^2 or \$14,000 per 100,000 ft^2 building for construction preceded by demolition.

All numbers reflect the value that occurs in the year of the construction. This is not an NPV calculation. While there undoubtedly are effects from landfill reduction that reverberate through the future years, they are not included in this analysis and assumed to be small. A more thorough study should analyze this further.

Note on Office Recycling

In this example, office recycling has been removed from calculations of green building waste reduction benefits. It is not clear that the tenants of green buildings would reduce disposed waste beyond California's already relatively aggressive statewide recycling goals.

[364] The tax value refers to the additional taxes the state is likely to collect as a result of the economic activity generation through diversion activities.

Appendix I: Total User Costs for California State Buildings

Calculations follow the chart.

Figure I-1. DGS Data for California State Buildings

2002 data for 9.25 million square feet of California state office space with 27,428 employees.

Total User Costs	Annual $/Employee					
BLDG.#	Electricity	O&M	Other Energy	Rent	Employee	Total
001	$555	$22,132	$0	$175	$65,141	$88,003
002	$432	$2,589	$0	$2,477	$65,141	$70,340
003	$557	$3,060	$16	$7,239	$65,141	$75,595
004	$619	$3,585	$0	$0	$65,141	$68,958
006/056	$771	$2,958	$0	$5,747	$65,141	$73,975
008	$406	$2,373	$0	$8,367	$65,141	$75,991
009	$117	$1,812	$0	$932	$65,141	$67,929
010	$189	$1,609	$0	$4,603	$65,141	$71,436
011	$202	$6,476	$0	$4,445	$65,141	$76,247
013	$183	$979	$0	$3,349	$65,141	$69,651
018	$223	$806	$0	$2,962	$65,141	$69,595
019	$351	$1,612	$147	$0	$65,141	$67,018
021	$387	$2,442	$0	$4,959	$65,141	$72,625
025	$725	$5,997	$5	$13,893	$65,141	$85,354
028	$335	$167	$14	$0	$65,141	$66,020
030	$335	$1,166	$24	$5,705	$65,141	$72,371
036	$1,570	$4,563	$5	$0	$65,141	$70,232
039/045	$231	$1,024	$1	$3,061	$65,141	$69,804
075	$516	$1,862	$19	$3,320	$65,141	$71,117
091	$325	$17,112	$0	$0	$65,141	$82,270
330	$376	$6,308	$18	$6,346	$65,141	$77,946
402	$602	$2,631	$0	$15,044	$65,141	$83,869

753	$1,039	$3,392	$88	$9,915	$65,141	$78,587
801	$701	$4,999	$96	$6,994	$65,141	$77,391
901	$615	$3,780	$41	$3,995	$65,141	$73,048
Averages	**$408**	**$3,039**	**$12**	**$4,755**	**$65,141**	**$73,355**

Assembled for this report by the California Department of General Services and the Real Estate Services Division.

Energy Use Calculations
For purposes of calculating emissions from energy for Section V, it was necessary to determine a conservative value for electricity used per square foot. This can be derived by first determining electricity consumption per employee, then multiplying electricity consumption per employee by number of employees and dividing by the number of total square feet, as follows:

$408/0.12kWh/ft^2	=	3400 kWh/employee/year
3,400 x 27,428	=	93,255,200 kWh/year (for all building area)
93,255,200/9,250,000	=	**10 kWh/ft^2/yr**

Office energy costs for California state employees in 2002 were about:[365]
$1.60/ft^2 or $360/employee/year

This paper assumes an expected drop in electricity prices from $0.12/kWh to $0.11/kWh.[366] Therefore these figures are discounted to:
$1.47/ft^2/yr or $330/employee/year

Figure H-1 shows total energy costs per employee of $420.
Electricity + Other Energy = Total Energy: $408+$12=$420

Additionally, according to the Real Estate Services Division, average office space per worker is:
225 ft^2/employee

However, the information in Figure H-1 seems to imply more space than this:
9,250,000/27,428 = 337 ft^2/employee

These discrepancies can be explained as follows:

The total energy costs from Figure H-1 are understood to be the total energy consumed by the buildings divided by the number of employees. Therefore, energy costs for all buildings are:

27,428 x $420 = $11,519,760

This doesn't account for two factors:

1. The influence of "transients" or non-employees in the building, thereby increasing the effective number of employees.
2. Non-office space such as stairwells, elevator shafts and hallways, which are communal and generally unconditioned.

State buildings, in providing services, often have many non-employees inside them. Assuming a "transient factor" of 5% (on average there is space for 5% more people in the building than reported employees) results in a higher number of "effective employees":

[365] Data provided by the California Department of General Services, Real Estate Services Division, Building Property Management Brach, December 2002.
[366] California Energy Commission. Office of the Supervisor of Rates. December 2002. $0.11/kWh is a conservative estimate. Higher rates would increase green building benefits.

27,428 x 1.05 = 28,799 effective employees

All office buildings have a significant amount of non-office space. This space is generally both shared by all and less heavily conditioned (requiring less energy in heat and electricity) than office space. Assuming 30% of these state office buildings are non-office space delivers:

9.25 million ft^2 x 70% = 6.475 million ft^2 office space

Assuming non-office space requires 1/3 the energy of office space, this means that, while office space only makes up 70% of the building, it consumes 90% of the energy, thus:

$11,519,760 x 90% = $10,367,784 (energy cost of conditioning office space)

It is only this energy cost that should be attributed to employees, as energy costs of non-office space can't be assumed to scale evenly with number of employees.
Thus, energy costs per effective employee are:

$10,367,784/28,799 = $360/employee/year

Furthermore, office space per employee is:

6,475,000/28,799 = **225 ft^2/employee/year**

And energy costs per square foot are:

$10,367,784/6,475,000 = $1.60/$ft^2$/yr

These numbers are for 2002, when electricity cost (and therefore most of the cost of energy) was $0.12/kWh. However, estimates for future electricity cost are $0.11/kWh. Scaling the above figure down delivers:

$1.60 x (11/12) = **$1.47/ft^2/yr**

This is the number used throughout this report.

Appendix J: Health and Productivity Gains from Better Indoor Environments[367]

This is a direct excerpt from the work of William J. Fisk and Satish Kumar.

Acute Respiratory Illness (ARI)

No high quality studies identified had investigated but failed to find a link between building characteristics and acute respiratory illnesses (ARIs) such as influenza and common colds. Eight studies reported statistically significant 23% to 76% reductions in ARIs among occupants of buildings with higher ventilation rates, reduced space sharing, reduced occupant density, or irradiation of air with ultraviolet light. These changes to buildings or building use were considered technically feasible and practical, given sufficient benefits. One study found a 35% reduction in short-term absence, a surrogate for ARI, in buildings with higher ventilation rates. Because some of these studies took place in unusual building types, such as barracks and a jail, reductions in ARIs were adjusted downwards, and ranged from 9% to 20%. Multiplying this range by the annual cases of common colds and influenza resulted in an estimated 16 million to 37 million potentially avoided cases of common cold and influenza. Given the $70 billion annual cost of ARIs, the associated potential productivity gains were $6 billion to $14 billion.

Allergies and Asthma

The scientific literature reports statistically significant links between prevalence of allergy and asthma symptoms and a variety of changeable building characteristics or practices, including indoor allergen concentrations, moisture and mold problems, pets, and tobacco smoking. The reported links between these risk factors and symptoms were often quite strong. For example, parental smoking was typically associated with 20% to 40% increases in asthma symptoms. In numerous studies, mold or moisture problems in residences were associated with 100% increases in lower respiratory symptoms indicative of asthma. These moisture and mold problems are common; for example, about 20% of U.S. houses have water leaks. Based on these data, the estimated potential reduction in allergy and asthma symptoms from improved IEQ was 8% to 25%, among a large population -- 53 million with allergies and 16 million asthmatics. Given the $15 billion annual cost of allergies and asthma, the potential economic gains are $1 billion to $4 billion.

Sick Building Syndrome (SBS) Symptoms

SBS symptoms are acute symptoms, such as eye and nose irritation and headache, associated with occupancy in a specific building, but not indicating a specific disease. Risk factors for SBS symptoms identified in many studies include lower ventilation rates, presence of air conditioning, and higher indoor air temperatures. Increased chemical and microbiological pollutants in the air or on indoor surfaces, debris or moisture problems in HVAC systems, more carpets and fabrics, and less frequent vacuuming were risk factors in a smaller number of studies. One large study suggests that a 10 cfm per person increase in ventilation rates would decrease prevalences of the most common SBS symptoms on average by one third. Practical measures could diminish all these risk factors. Based on these data, the estimated potential reduction in SBS symptoms was 20% to 50%. The affected population is very large – in a survey of 100 U.S. offices, 23% of office workers (64 million workers) frequently experienced two or more SBS symptoms at work. The estimated productivity decrement caused by SBS symptoms in the office worker population was 2%, with an annual cost of $60 billion. A 20-50% reduction in these symptoms, considered feasible and practical, would bring annual economic benefits of $10 billion to $30 billion.

[367] Excerpted directly from: Satish Kumar and William J. Fisk, "The Role of Emerging Energy Efficient Technology in Promoting Workplace Productivity and Health: Final Report," LBNL, February 13, 2002, pp. 20-21. Available at: http://www-library.lbl.gov/docs/LBNL/497/06/PDF/LBNL-49706.pdf.

Direct Productivity Gains

Published literature documents direct linkages of worker performance with air temperatures and lighting conditions, without apparent effects on worker health. Many but not all studies indicate that small (few ^{o}C) differences in temperatures can influence workers' speed or accuracy by 2% to 20% in tasks such as typewriting, learning performance, reading speed, multiplication speed, and word memory. Surveys have documented that indoor air temperature is often poorly controlled, implying an opportunity to increase productivity.[368] It is estimated that providing ± 3^{o}C of individual temperature control would increase work performance by 3% to 7%. A smaller number of studies have documented improvements in work performance with better lighting, with benefits most apparent for visually demanding work. Increased daylighting was also linked in one study to improved student learning. Based on these studies and recognizing that performance of only some work tasks is likely to be sensitive to temperature and lighting, the estimated potential direct productivity gain is 0.5% to 5%, with the factor of ten range reflecting the large uncertainty. Considering only U.S. office workers, the corresponding annual productivity gain is $20 billion to $200 billion.

Appendix L: Annotated Bibliography

The following is a guide to primary sources in areas for which there are no comprehensive internet resources: Water Conservation and Waste Reduction.

Water Conservation

Water Use in Buildings

Pike, Charles. *Study of Potential Water Efficiency Improvement in Commercial Business*. US EPA/DWR, April 1997.
Sweeten, Jon and Ben Chaput. *Identifying the Conservation Opportunities in the Commercial, Industrial, and Institutional Sector*. Paper delivered to the AWWA, 1997.

These studies conclude that there is considerable opportunity for cost effective water conservation technology adoption in most commercial building types.

Sustainable Use of Water: California Success Stories. Publication of the Pacific Institute, January 1999. Available online at: http://www.pacinst.org/water.html

This document identifies, describes, and analyzes examples of sustainable water policies and practices throughout the state. Many of the 28 "stories" highlighted offer specific examples of water utilities that have adopted innovative water conservation policies. Others present an overview of a particular water conservation issue area. The most useful "story" for our purposes is Chapter 6: *An Overview of Water – Efficiency Potential in the CII Sector*. It finds that significant cost-effective water conservation potential currently exists in the CII building sector.

Externalities of Water Use and Public Policy

Renzetti, Steven. "Municipal Water Supply and Sewage Treatment: Costs, Prices, and Distortions." *Canadian Journal of Economics*, May 1999. Available online at: http://economics.ca/cje/

This empirical study in Canada estimated that the price charged for fresh water was only one-third to one-half the long-run marginal supply cost, and the prices charged for sewage were approximately one-fifth the long run cost of sewage treatment

---

CUWCC. *Guidelines for Preparing Cost-Effectiveness of Urban Water Conservation Best Management Practices*. September 1996. Available online, with many other resources related to urban water conservation, at: http://www.cuwcc.org/home.html.

This document contains the Total Society Cost Model of water conservation. It is designed to capture all avoided future economic, environmental, and social costs of urban water conservation in order to determine its true avoided cost. The CUWCC is currently conducting workshops to assist water utilities in using this model.

Economic Evaluation of Water Management Alternatives. Prepared for the CALFED Bay-Delta Program, October 1999. See: http://calwater.ca.gov/Archives/WaterManagement/WaterManagementArchive.shtml.

Available online at: http://calfed.ca.gov/Programs/WaterManagement/adobe_pdf/Calfed.pdf.

This document evaluates the cost-effectiveness of different water management options that would meet the state's anticipated water needs in 2020. The perspective taken is that of the end user of water in each region where SWP or CVP water is expected to be needed in 2020. The study analyses seven scenarios, each one assuming different policy decisions leading up to year 2020.

Fiske, Gary and Associates. *California Urban Water Agencies Urban Water Conservation Potential - Final Report,* August 2001. Available online at: http://www.cuwa.org/publications.html.

This study determines marginal cost numbers for new water supplies for every region of the state for each year from 2000 – 2040, from the perspective of the regional utility. It includes wastewater facility expansion and O&M expenses in these estimates. Many water experts in the state believe that the marginal cost numbers presented in this study are too low.

Bulletin 160-98: California Water Plan. California Department of Water Resources, 1998.
Available online at: http://rubicon.water.ca.gov/b160index.html.

This document, which is updated every five years, evaluates water supplies and assesses agricultural, urban, and environmental water uses to quantify the gap between water supplies and uses. It also evaluates options for meeting the state's future water needs. The next update will be released in 2003.

The Clean Water and Drinking Water Infrastructure Gap Analysis. Published by the EPA, August 2002.
Available online at: http://www.epa.gov/safewater/gapreport.pdf.

This document evaluates our country's current water delivery and treatment systems, and the financial health of the agencies that operate them. It concludes that the expected gap between future revenues (based on historical price increases) and infrastructure needs for potable water and wastewater treatment will be approximately $148 billion over the next twenty years.

Field, Christopher. *Confronting Climate Change in California: Ecological Impacts on the Golden State.* Publication of the Union of Concerned Scientists, 1999. Available online at http://www.ucsusa.org/.

This document summarizes the likely impacts of climate change in California. It indicates that changes in precipitation patterns will have a dramatic affect on the state's ecology and economy. Specifically, more precipitation will fall as rain, rather than snow, causing massive flooding in the spring and droughts by late summer. Reduced summer runoff of fresh water would also increase summer salinity in San Francisco Bay.

Gleick, Peter. *Water: The Potential Consequences of Climate Variability and Change for the Water Resources of the United States*. Publication of the Pacific Institute, September 2000.
Available online at: http://www.pacinst.org/.

This document summarizes the results of nearly 1,000 peer-reviewed studies on climate change. Consensus conclusions are similar to those presented in the UCS study above.

Bulletin 132: Management of the California State Water Project. Publication of DWR, 1999.
Available online at: http://wwwdwr.water.ca.gov/.

This is part of a series of annual reports that describe the status of State Water Project (SWP) operations. Each annual report updates information regarding project costs and financing, water supply planning, power operations, and significant events that affect the management of the State Water Project. The publication aggregates SWP energy costs associated with pumping water throughout the state.

Preparing for California's Next Drought. Publication of DWR, July 2000.
Available online at: http://wwwdwr.water.ca.gov/.

Between 1987-1992, California experienced its longest drought in more than a century. Over 85% of the counties in the state declared local emergencies. This document presents the lessons learned from this experience and offers policy recommendations to better prepare for future drought years.

Notably, the document states the following:
Article X, Section 2 of the California Constitution prohibits waste or unreasonable use or unreasonable method of use of water. ... Water Code Section 275 directs the Department [of Water Resources] and the SWRCB to take appropriate actions before courts, administrative agencies, and legislative bodies to prevent waste or misuse of water.

Multi-Agency Benchmarking Project. Published by the King County Department of Natural Resources, publication 1282, September 1999.

This document presents the findings from a collaborative effort among seven large West Coast wastewater utilities to collect, compare and analyze cost and operational data. The investigation examines all aspects of sewage treatment facility operation. For example, in 1997, the average direct operating cost among these utilities was $729 per million gallons of treated water. Operations and Maintenance (O&M) accounted for roughly half of this amount. O&M includes direct operational labor, as well as energy and chemicals. Notably, power purchases were the second largest cost factor within O&M.

Waste Reduction

Skumatz, Lisa, SERA Inc, and Jeff Morris, SRMG. *Massachusetts Recycle 2000: Baseline Report* (Excerpts). Prepared for the Executive Office of Environmental Affairs, State of Massachusetts, December 1998.

This document compares the economic and environmental costs of waste disposal and curbside recycling in Massachusetts. This is the only analysis that we have seen that attempts to quantify the "hard to quantify" environmental costs from a state's perspective. It concludes that the total benefits of recycling, net of disposal benefits, are worth $270 - $379 per ton to the state.

Goldman, George and Aya Ogishi. *The Economic Impact of Waste Disposal and Diversion in California.* Department of Agricultural and Resource Economic, UC Berkeley, April 2001.
Available online at: http://are.berkeley.edu/coopext/EconImpWaste.pdf.

This study quantifies and compares the economic impacts of disposal and diversion in six regions within the state. The results show both that on average, diversion has twice the economic impact of disposal and that the benefits of diversion vary greatly among regions in the state. In general, recycling has a greater impact in regions with well-developed recycling infrastructure and mature recycling industries.

California Recycling Economic Information Study (REI), prepared for CIWMB by the National Recycling Coalition in association with R.W. Beck, Inc, July 2001.
Available online at: http://www.ciwmb.ca.gov/agendas/mtgdocs/2002/01/00007124.pdf.

This study uses a broader definition of diversion than the UCB study to quantify the size and makeup of the diversion industry in California and its economic impacts. It also compares diversion to other sectors of the economy and shows how the economic impacts from diversion in California fit within the nationwide economy. It reaches similar conclusions about the economic impact of diversion as the UCB study.

Greenhouse Gas Emissions from Management of Selected Materials in Municipal Solid Waste, Final Report. Prepared by the US EPA, September 1998.

This document summarizes and assesses air emission data from different forms of waste management including incineration, landfilling and recycling.

Disposal Cost Fee Study, Final Report. Prepared by the Tellus Institute for the California Integrated Waste Management Board, February 1991.

Before the UCB and REI studies were released, this study provided the most comprehensive data on California's waste disposal system. It categorizes and analyzes the types of waste found in California's waste stream, and identifies environmental threats associated with waste diversion and disposal of various products/types of waste.

Construction Waste Management Section of the California Sustainable Design Training Manual, 2001.

This document provides an overview of waste management and all of the relevant green issues associated with it. It also provides an extensive list of internet sites with additional resources on the topic.

Glossary of Acronyms

A number of acronyms are referred to or used in this report. They are spelled out below, and when they first appear in the text.

ACEEE – American Council for an Energy Efficient Economy
ADL – Arthur D. Little Consultants
af – acre-foot (of water)
ASHRAE – American Society of Heating, Refrigerating, and Air-Conditioning Engineers
ARB – Air Resources Board (CA)
ASTM – American Society for Testing and Materials
BEPAC – Building Environmental Performance Criteria (Canada)
BEES – Building for Environmental and Economic Sustainability
BIDS – Building Investment Decision Support
BOMA – Building Owners & Managers Association
BREEAM – British Research Establishment Environment Assessment Method
C&D – construction & demolition
CalTrans – Department of Transportation (CA)
CBA – cost benefit analysis
CEC – California Energy Commission
CIWMB – California Integrated Waste Management Board
CO2 – carbon dioxide
CUWA – California Urban Water Agencies
CUWCC – California Urban Water Conservation Council
DGS – Department of General Services (CA)
DOE – Department of Energy (US)
DOF – Department of Finance (CA)
DSA – Division of the State Architect (CA)
DWR – Department of Water Resources (CA)
EIA – Energy Information Administration (US)
EPA – Environmental Protection Agency
FEMP – Federal Energy Management Program
GHG – greenhouse gases
GW(h) – gigawatt (hour) = 1 billion watts
HVAC – heating, ventilation and air conditioning
IAQ – indoor air quality
IEQ – indoor environmental quality
IFMA – International Facilities Management Association
IPCC – Intergovernmental Panel on Climate Change
IPMVP – International Performance Measurement & Verification Protocol
IRR – internal rate of return
ISO – International Organization for Standardization
kW(h) – kilowatt (hour) = 1000 watts
LADWP – Los Angeles Department of Water and Power
LBNL – Lawrence Berkeley National Labs
LCA – life cycle assessment
LEED – Leadership in Energy & Environmental Design (USGBC)
MW(h) – megawatt (hour) = 1 million watts
MWD – Metropolitan Water District
NIST – National Institute of Standards and Technology
NOx – oxides of nitrogen
NPV – net present value
NREL – National Renewable Energy Labs
O&M – operations & maintenance
PG&E – Pacific Gas & Electric Company
PIER – Public Interest Energy Research (CA)
PM10 – particulate matter
PUC – Public Utilities Commission
PV – solar photovoltaics
PV – present value
SBTF – Sustainable Building Task Force (CA)
SCE – Southern California Edison
SDG&E – San Diego Gas & Electric Co.
SMUD – Sacramento Municipal Utility District
SOx – oxides of sulfur
T&D – transmission & distribution
USGBC – US Green Building Council
VOC – volatile organic compound

King County Department of Development and Environmental Services
SEPA GHG Emissions Worksheet
Version 1.7 12/26/07

Introduction

The Washington State Environmental Policy Act (SEPA) requires environmental review of development proposals that may have a significant adverse impact on the environment. If a proposed development is subject to SEPA, the project proponent is required to complete the SEPA Checklist. The Checklist includes questions relating to the development's air emissions. The emissions that have traditionally been considered cover smoke, dust, and industrial and automobile emissions. With our understanding of the climate change impacts of GHG emissions, King County requires the applicant to also estimate these emissions.

Emissions created by Development

GHG emissions associated with development come from multiple sources:

- The extraction, processing, transportation, construction and disposal of materials and landscape disturbance (Embodied Emissions)
- Energy demands created by the development after it is completed (Energy Emissions)
- Transportation demands created by the development after it is completed (Transportation Emissions)

GHG Emissions Worksheet

King County has developed a GHG Emissions Worksheet that can assist applicants in answering the SEPA Checklist question relating to GHG emissions.

The SEPA GHG Emissions worksheet estimates all GHG emissions that will be created over the life span of a project. This includes emissions associated with obtaining construction materials, fuel used during construction, energy consumed during a buildings operation, and transportation by building occupants.

Using the Worksheet

1. Descriptions of the different residential and commercial building types can be found on the second tabbed worksheet ("Definition of Building Types"). If a development proposal consists of multiple projects, e.g. both single family and multi-family residential structures or a commercial development that consists of more than on type of commercial activity, the appropriate information should be estimated for each type of building or activity.

HOMEWOOD MOUNTAIN RESORT

WATER SUPPLY ASSESSMENT

Prepared For:

Homewood Village Resorts, LLC

HOMEWOOD
Mountain Resort

Draft Final
September 2010

Table 3. Projected Annual Demand for the McKinney/Quail Sub-district

	Annual Demand (AF/Y)		
Service Area	**2009**	**2010**	**2011**
McKinney/Quail Sub-district	381	385	385
Proposed Project (residential)	n/a	n/a	46
Proposed Project (commercial)	n/a	n/a	5
Proposed Project (irrigation)	n/a	n/a	11
Proposed Project Subtotal	n/a	n/a	62
Total Annual Demand (AF/Y)			**447**

Based on the information presented in Table 3, the proposed project will require 62 AF/Y. When added to the future projected annual demand for the McKinney/Quail Sub-district (385 AF/Y), the total projected annual water demand for the McKinney/Quail Sub-district, including the proposed project and associated irrigation operations, is 447 AF/Y.

<u>Alternative 2</u>

North Base - MCWC Service Area.

Based on the annual water demand in this region calculated by TCPUD in their Water Master (0.84 AF/Y)(TCPUD 2002), the projected water demand for the MCWC Service Area is 134 AF/Y. The projected values for the proposed project, shown in Table 4, were calculated using the demand rates described above (Residential – 0.14 AF/Y per unit and Commercial – 0.07 AF/Y per 1,000 sf CFA). In addition to residential and commercial water demand for the proposed project, water will be used for irrigation operations. Based on schematic design (as discussed in Section 2.2), 8.3 AF/Y of water will be required for irrigation. This value is included in the projected water demand shown in Table 4.

Table 4. Projected Annual Demand for MCWC Service Area

	Annual Demand (AF/Y)		
Service Area	**2009**	**2010**	**2011**
MCWC	134	134	134
Proposed Project - North Base (residential)	n/a	n/a	30
Proposed Project - North Base (commercial)	n/a	n/a	4
Proposed Project - North Base (irrigation)	n/a	n/a	8
Proposed Project - North Base Subtotal	n/a	n/a	42
Total Annual Demand (AF/Y)			**176**

Based on information presented in Table 4, the proposed project (North Base Area) will require 42 AF/Y. When added to the future projected annual demand for the MCWC Service Area (134 AF/Y), the total projected annual water demand for the MCWC Service Area is 176 AF/Y.

National Oceanic and Atmospheric Administration

Greenhouse Gases

Frequently Asked Questions

Introduction

What are greenhouse gases?

Many chemical compounds present in Earth's atmosphere behave as 'greenhouse gases'. These are gases which allow direct sunlight (relative shortwave energy) to reach the Earth's surface unimpeded. As the shortwave energy (that in the visible and ultraviolet portion of the spectra) heats the surface, longer-wave (infrared) energy (heat) is reradiated to the atmosphere. Greenhouse gases absorb this energy, thereby allowing less heat to escape back to space, and 'trapping' it in the lower atmosphere. Many greenhouse gases occur naturally in the atmosphere, such as carbon dioxide, methane, water vapor, and nitrous oxide, while others are synthetic. Those that are man-made include the chlorofluorocarbons (CFCs), hydrofluorocarbons (HFCs) and Perfluorocarbons (PFCs), as well as sulfur hexafluoride (SF_6). Atmospheric concentrations of both the natural and man-made gases have been rising over the last few centuries due to the industrial revolution. As the global population has increased and our reliance on fossil fuels (such as coal, oil and natural gas) has been firmly solidified, so emissions of these gases have risen. While gases such as carbon dioxide occur naturally in the atmosphere, through our interference with the carbon cycle (through burning forest lands, or mining and burning occurs in the NH spring and summer as plants convert CO_2 to plant material through photosynthesis. It is then released again in the fall and winter as the plants decompose.

Methane

Methane is an extrememly effective absorber of radiation, though its atmospheric concentration is less than CO_2 and its lifetime in the atmosphere is brief (10-12 years), compared to some other greenhouse gases (such as CO_2, N_2O, CFCs). Methane(CH_4) has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas and mining coal have added to the atmospheric concentration of methane. Direct atmospheric measurement of atmospheric methane has been possible since the late 1970s and its conentration rose from 1.52 ppmv in 1978 by around 1%/year to 1990, since when there has been little sustained increase. The current atmospheric concentration is ~1.77 ppmv, and there is no scientific consensus on why methane has not risen much since around 1990.

Tropospheric Ozone

Ultraviolet radiation and oxygen interact to form ozone in the stratosphere. Existing in a broad band, commonly called the 'ozone layer', a small fraction of this ozone naturally descends to the surface of the Earth. However, during the 20th century, this tropospheric ozone has been supplemented by ozone created by human processes. The exhaust emissions from automobiles and pollution from factories (as well as burning vegetation) leads to greater concentrations of carbon and nitrogen molecules in the lower atmosphere which, when it they are acted on by sunlight, produce ozone. Consequently, ozone has higher concentrations in and around cities than in sparsely populated areas, though there is some transport of ozone downwind of major urban areas. Ozone is an important contributor to photochemical smog. Though the lifetime of ozone is short, and is therefore not well-mixed through the atmosphere, there is a general band of higher ozone concentration during NH spring and summer between 30 N and 50 N resulting from the higher urbanization and industrial activity in this band. Concentrations of ozone have risen by around 30% since the pre-industrial era, and is now considered by the IPCC to be the third most important greenhouse gas after carbon dioxide and methane. An additional complication of ozone is that it also interacts with and is modulated by concentrations of methane.

Nitrous Oxide

Concentrations of nitrous oxide also began to rise at the beginning of the industrial revolution and is understood to be produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. Increasing use of

High Global Warming Potential (GWP) Gases

Science

Many of the links on this page are to sites outside of EPA. See EXIT Disclaimer to learn more.

High GWP Gases and Climate Change

There are three major groups or types of high GWP gases: hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). These compounds are the most potent greenhouse gases. In addition to having high global warming potentials, SF_6 and PFCs have extremely long atmospheric lifetimes, resulting in their essentially irreversible accumulation in the atmosphere once emitted (see below).

Global Warming Potential (GWP)

The concept of a global warming potential (GWP) was developed to compare the ability of each greenhouse gas to trap heat in the atmosphere relative to another gas. The definition of a GWP for a particular greenhouse gas is the ratio of heat trapped by one unit mass of the greenhouse gas to that of one unit mass of CO_2 over a specified time period.

As part of its scientific assessments of climate change, the Intergovernmental Panel of Climate Change (IPCC) has published reference values for GWPs of several greenhouse gases. While the most current estimates for GWPs are listed in the IPCC's Fourth Assessment Report (AR4), EPA analyses use the 100-year GWPs listed in the IPCC's Second Assessment Report (SAR) to be consistent with the international standards under the United Nations Framework Convention on Climate Change (UNFCCC) (IPCC, 1996). (See the following table titled 2.14 (Errata) (PDF) (5 pp, 360K, About PDF) for a listing of GWPs and atmospheric lifetimes of methane and the other major species of greenhouse gases for comparison. The table is taken from Climate Change 2007: A Physical Science Basis: The Working Group I Contribution to the IPCC Fourth Assessment Report as the SAR is not available on-line.)

High GWP gases are emitted from a broad range of industrial sources and for more of these gases there are few (if any) natural sources of emissions.

The following sections describe some fundamental characteristics of high GWP gases and their presence in the atmosphere:

- Hydrofluorocarbons (HFCs)
- Perfluorocarbons (PFCs)
- Sulfur Hexafluoride (SF_6)

Hydrofluorocarbons (HFCs)

HFCs are man-made chemicals, many of which have been developed as alternatives to ozone-depleting substances (ODS) for industrial, commercial, and consumer products. The global warming potentials of HFCs range from 140 (HFC-152a) to 11,700 (HFC-23). The atmospheric lifetime for HFCs varies from just over a year for HFC-152a to 260 years for HFC-23. Most of the commercially used HFCs have atmospheric lifetimes less than 15 years; e.g., HFC-134a, which is used in automobile air conditioning and refrigeration, has an atmospheric life of 14 years.

The HFCs with the largest measured atmospheric abundances are (in order), HFC-23 (CHF_3), HFC-134a (CF_3CH_2F), and HFC-152a (CH_3CHF_2). The only significant emissions of HFCs before 1990 were of the chemical HFC-23, which is generated as a byproduct of the production of HCFC-22. HFCs are primarily used as a substitute for ozone-depleting chemicals. Between 1978 and 1995, HFC-23 concentrations have increased from 3 to 10 parts per trillion (ppt), and continue to rise. Since 1990, when it was almost undetectable, global average concentrations of HFC-134a have risen significantly to almost 10 ppt (parts per trillion). HFC-134a has an atmospheric lifetime of about 14 years and its abundance is expected to continue to rise in line with its increasing use as a refrigerant around the world. HFC-152a has increased steadily to about 0.3 ppt in 2000, however its relatively short life time (1.4 years) has kept its atmospheric concentration below 1 ppt (IPCC, 2001).

Perfluorocarbons (PFCs)

Primary aluminum production and semiconductor manufacture are the largest known man-made sources of two perfluorocarbons – CF_4 (tetrafluoromethane) and C_2F_6 (hexafluoroethane). The GWP of CF_4 and C_2F_6 emissions is equivalent to approximately 6,500 and 9,200 tonnes, respectively. PFCs are also relatively minor substitutes for ozone-depleting substances (ODSs).

PFCs have extremely stable molecular structures and are largely immune to the chemical processes in the lower atmosphere that break down most atmospheric pollutants. Not until the PFCs reach the mesosphere, about 60 kilometers above Earth, do very high-energy ultraviolet rays from the sun destroy them. This removal mechanism is extremely slow and as a result PFCs accumulate in the atmosphere and remain there for several thousand years. The estimated atmospheric lifetimes for CF_4 and C_2F_6 are 50,000 and 10,000 years respectively. Measurements in 2000 estimate CF_4 global concentrations in the stratosphere at over 70 parts per trillion (ppt). Recent relative rates of increase in concentrations for two of the most important PFCs are 1.3% per year for CF_4 and 3.2% per year for C_2F_6 (IPCC, 2001).

Sulfur Hexafluoride (SF_6)

The global warming potential of SF_6 is 23,900, making it the most potent greenhouse gas the IPCC has evaluated. SF_6 is a colorless, odorless, nontoxic, nonflammable gas with excellent dielectric properties. SF_6 is used for insulation and current interruption in electric power transmission and distribution equipment, in the magnesium industry to protext molten magnesium from oxidation and potentially violent burning, in semiconductor manufacturing to create circuitry patterns on silicon wafers, and as a tracer gas for leak detection.

Like the other high GWP gases, there are very few sinks for SF_6, so all man-made sources contribute directly to its accumulation in the atmosphere. Measurements of SF_6 show that its global average concentration has increased by about 7% per year during the 1980s and 1990s, from less 1 ppt in 1980 to almost 4 ppt in the late 1990′s (IPCC, 2001).

EXECUTIVE SUMMARY

Global Climate Change (GCC), which is now generally accepted by the scientific community to be occurring and caused by Greenhouse Gases (GHGs), is a widely discussed scientific, economic, and political issue in the United States. Briefly stated, GCC is the cumulative change in the average weather of the earth that may be measured by changes in temperature, precipitation, storms, and wind. GHGs are gases that trap heat in the atmosphere. The scientific and policy communities in the State of California have collectively concluded that a significant and growing scientific body of evidence supports the need for regulating GHG emissions. Worldwide, California is estimated to be the 15^{th} largest emitter of carbon dioxide (CARB 2008), and this fact has added to the impetus behind California's leadership in this area.

California is exercising climate change leadership in two significant efforts: one, the passage and implementation of Assembly Bill 32 (AB32), the "California Global Warming Solutions Act of 2006", which was designed to significantly reduce existing and future GHG emissions in the State of California; and two, in the analysis of environmental impacts of new GHG emissions related to discretionary project approvals under the California Environmental Quality Act (CEQA). This latter effort has been particularly difficult to implement as no state or local agency has provided definitive guidance on how to address GHG emissions impacts under CEQA.

Recognizing the dearth of regulatory guidance, the San Joaquin Valley Air Pollution Control District's Governing Board adopted the Climate Change Action Plan (CCAP) in August 2008. The CCAP directed the District's Air Pollution Control Officer to develop guidance to assist District staff, valley businesses, land–use agencies, and other permitting agencies in addressing GHG emissions as part of the CEQA process. The CCAP also directs District staff to investigate and develop a greenhouse gas banking program, enhance the existing emissions inventory process to include greenhouse gas emissions reporting consistent with new state requirements, and administer voluntary greenhouse gas emission reduction agreements. These items would then be brought before the Governing

Board for their consideration. Regarding CEQA GHG guidance, the goals of the CCAP are to establish District processes for assessing the significance of project specific GHG impacts for projects permitted by the District; assist local land use agencies, developers, and the public by identifying and quantifying GHG emission reduction measures for development projects and by providing tools to streamline evaluation of project specific GHG effects; ensure that collateral emissions from GHG emission reduction projects do not adversely impact public health or environmental justice communities in the Valley; and assist Valley businesses in complying with state law related to GHG emission reduction.

CEQA requires lead agencies to establish specific procedures for administering its responsibilities under CEQA, including orderly evaluation of projects and preparation of environmental documents. Therefore, the District is developing guidance for its own internal use when serving as the lead agency, and is also proposing guidance to assist other agencies in establishing their own processes for determining significance of project related impacts on global climate change. Nothing in this guidance shall be construed as limiting a lead agency's authority to adopt a statement of overriding consideration for projects with significant GHG impact.

This staff report provides a summary of background information on Global Climate Change, the current regulatory environment surrounding GHG emissions, and the various concepts in addressing the potential impacts of Global Climate Change. It evaluates different approaches for estimating impacts, and summarizes potential mitigation measures. As presented in this Staff Report, District staff concludes that existing science is inadequate to support quantification of impacts that project specific GHG emissions have on global climatic change. This is readily understood when one considers that global climatic change is the result of the sum total of GHG emissions, both man made and natural that occurred in the past; that is occurring now; and will occur in the future. The effects of project specific GHG emissions are cumulative, and without mitigation, their incremental contribution to global climatic change could be considered significant. District staff concludes that this cumulative impact is best addressed by requiring all projects subject to CEQA to reduce their GHG emissions through project design elements.

District staff has proposed an approach intended to streamline the process of determining if project specific GHG emissions would have a significant effect. The proposed approach relies on the use of performance based standards and their associated pre-quantified GHG emission reduction effectiveness (Best Performance Standards). Establishing Best Performance Standards (BPS) would help project proponents, lead agencies, and the public by proactively identifying effective, feasible mitigation measures. Emission reductions achieved through implementation of BPS would be pre-quantified thus, negating the need for project specific quantification of GHG emissions.

As defined, BPS is the most effective, achieved-in-practice, means of reducing or limiting GHG emissions from a GHG emissions source. For traditional stationary source projects, BPS includes equipment type, equipment design, and operational and maintenance practices for the identified service, operation, or emissions unit class and category. For development projects, BPS includes project design elements, land use decisions, and technologies that reduce GHG emissions.

BPS would be established through a process approved by the District's Governing Board. The proposed process would provide ample opportunity for stakeholders and other interested parties to participate and provide valuable input into the establishment of baseline GHG emissions and BPS.

Once BPS has been established, projects implementing Best Performance Standards would be determined to have a less than significant individual and cumulative impact on global climate change and would not require project specific quantification of GHG emissions. Projects exempt from the requirements of CEQA, and projects complying with an approved GHG emission reduction plan or mitigation program would also be determined to have a less than significant individual and cumulative impact. Such plans or programs must be specified in law or adopted by the public agency with jurisdiction over the affected resources and have a certified Final CEQA document.

Projects not implementing BPS would require quantification of project specific GHG emissions. To be determined to have a less than significant individual and cumulative impact on global climate changes, such projects must be determined to have reduced or mitigated GHG emissions by 29%, consistent with GHG emission reduction targets established in ARB's AB 32 Scoping Plan[1]. Furthermore, quantification of GHG emissions would be required for all projects for which the lead agency has determined that an Environmental Impact Report is required, whether or not the project incorporates Best Performance Standards.

In evaluating GHG emissions from a specific project the District recommends that a lead agency characterize both direct and indirect GHG emissions. Direct GHG emissions would include emissions resulting from a specific operation or process, e.g. fuel combustion emissions from a boiler. Indirect GHG emissions would include emissions resulting from project related energy consumption, e.g. electricity consumed by the production and electricity required to produce and transport water used by the project. For projects resulting in increased vehicle miles traveled (VMT), indirect GHG emissions associated with transportation related activities would also be included in the GHG emissions quantification.

The proposed methodology the District will use when establishing BPS and assessing GHG significance requires approval by the District Governing Board. However, approval of this methodology would not constitute adoption of a rule or regulation. Other agencies may choose to use this proposed process as guidance when establishing their own procedures for assessing the significance of project specific impacts on global climate change.

[1] *Climate Change Proposed Scoping Plan;* P. 12 and 21. California Air Resources Board, October 2008

CHAPTER 1

CLIMATE CHANGE ACTION PLAN (CCAP) INTRODUCTION

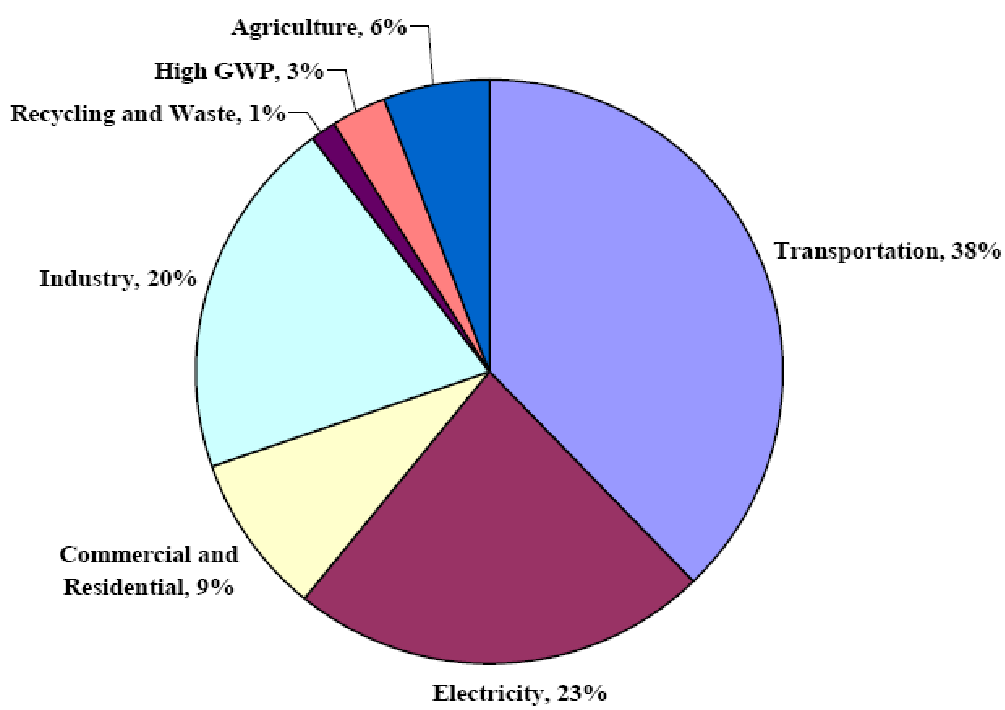
1.1 General Climate Change Issues and Background

The scientific and political communities in the State of California have collectively concluded that a significant and growing scientific body of evidence supports the need for regulating GHG emissions. Compilations of data and analyses, such as the 2007 report from the Intergovernmental Panel on Climate Change (IPCC), have provided a generally accepted scientific basis for implementing climate change policy.

In the last few years information and data have been compiled that demonstrate increases in average global air and ocean temperatures are occurring (AEP 2007). According to the IPCC Report, global temperatures are expected to rise approximately 0.2 degree Celsius per decade for the next couple of decades under a variety of scenarios (IPPC 2007). Further, global temperatures are expected to continue to increase for centuries as a result of human activities due to the time scales associated with climate processes and feedbacks, even if GHG concentrations are stabilized. As a result, based on the current understanding of climate-carbon feedback, model studies show that substantial GHG emission reductions are necessary to avoid substantial increases in global air and ocean temperatures.

As a result of human activities, such as electricity production, vehicle use, etc., GHGs have been accumulating in the earth's atmosphere at a faster rate than has occurred historically, i.e., prior to the Industrial Age starting approximately 150 years ago (AEP 2007). Figure 1 shows that the largest source of GHG in California is transportation, contributing 38 percent of the State's total GHG emissions for the 2002-2004 average emissions, expressed in million metric tons Carbon Dioxide Equivalent ($MMTCO_2E$), up from 35% in 1990. Electricity generation and importation is the second largest source, contributing over 25 percent of the State's GHG emissions (ARB 2008). Additional information is available from the Air Resources Board (www.arb.ca.gov).

Figure 1: California's Greenhouse Gas Emissions by Sector (Gross Emissions: 469 MMT CO_2E)



Source: ARB, 2008

Some greenhouse gases such as water vapor occur naturally and are emitted to the atmosphere through natural processes as well as through human activities. The most common GHG that results from human activity is carbon dioxide, followed by methane and nitrous oxide. GHGs can include:

Water Vapor: Although not considered a pollutant, water vapor is the most important, abundant, and variable GHG. In the atmosphere, it maintains a climate necessary for life. The main source of water vapor is evaporation from the ocean (approximately 85 percent). Other sources include sublimation (change from solid to gas) from ice and snow, evaporation from other water bodies, and transpiration from plant leaves.

Ozone: Unlike other GHG, ozone is relatively short- lived and, therefore, is not global in nature. It is difficult to make an accurate determination of the contribution of ozone precursors (nitrogen oxides and volatile organic compounds) to global climate change (AEP 2007).

Aerosols: Aerosols are suspensions of particulate matter in a gas emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light. Cloud formation can also be affected by aerosols. Sulfate aerosols are emitted when fuel-containing sulfur is burned. Black carbon (or soot) is emitted during bio mass burning or incomplete combustion of fossil fuels. Particulate matter regulation has been lowering aerosol concentrations in the United States; however, global concentrations are likely increasing.

Chlorofluorocarbons: Chlorofluorocarbons (CFCs) are gases formed synthetically by replacing all hydrogen atoms in CH_4 or ethane with chlorine and/or fluorine atoms. CFCs are nonflammable, nontoxic, insoluble, and chemically uncreative in the troposphere (the level of air at the earth's surface). CFCs were first synthesized in 1928 for use as cleaning solvents, refrigerants, and aerosol propellants. They destroy stratospheric ozone; therefore, their production was stopped as required by the Montreal Protocol in 1987 (AEP 2007).

Carbon dioxide: Carbon dioxide (CO_2) is an odorless, colorless gas, which has both natural and anthropogenic sources. Natural sources include the following: respiration of bacteria, plants, animals, and fungus, evaporation from oceans, volcanic outgassing, and decomposition of dead organic matter. Anthropogenic sources of carbon dioxide are from burning coal, oil, natural gas, and wood. Concentrations of CO_2 were 379 parts per million (ppm) in 2005, which is an increase of 1.4 ppm per year since 1960 (AEP 2007).

Methane: Methane (CH_4) is a flammable gas and is the main component of natural gas. When one molecule of CH_4 is burned in the presence of oxygen, one molecule of carbon dioxide and two molecules of water are released. There are no direct ill health effects from CH_4. A natural source of CH_4 is from the anaerobic decay of organic matter. Geological deposits, known as natural gas fields, also contain CH_4, which is extracted for fuel. Other sources are from cattle, fermentation of manure, and landfills.

Nitrous oxide: Nitrous oxide (N_2O), also known as laughing gas, is a colorless greenhouse gas. Higher concentrations of N_2O can cause euphoria, dizziness, and slight hallucinations. N_2O is produced by microbial processes in soil and water, including those reactions that occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (nitric acid production, nylon production, fossil fuel-fired power plants, and vehicle emissions) also contribute to its atmospheric load. It is used in racecars, rocket engines, and as an aerosol spray propellant.

Fluorinated Gases: Gases that are synthetic, powerful GHG that are emitted from a variety of industrial processes.

- Hydrofluorocarbons: Hydrofluorocarbons (HFCs) are synthetic man-made chemicals that are used as a substitute for CFCs for automobile air conditioners and refrigerants.
- Perfluorocarbons: Perfluorocarbons (PFCs) have stable molecular structures and do not break down though the chemical processes in the lower atmosphere. High-energy ultraviolet rays, roughly 60 lulometers above the earth's surface are able to destroy the compounds. PFCs have long lifetimes, ranging between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane and hexafluoroethane. Concentrations of tetrafluoromethane in the atmosphere are over 70 parts per trillion (ppt) (AEP 2007). The two main sources of PFCs are primary aluminum production and semiconductor manufacture.
- Sulfur hexafluoride: Sulfur hexafluoride (SF_6) is an inorganic, colorless, odorless, nontoxic, nonflammable gas. Concentrations in the 1990s were roughly 4 ppt (AEP 2007). SF_6 is used for insulation in electric power transmission and distribution equipment, in semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.

Under Assembly Bill 32 (AB32) GHGs are defined as carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs).

The global warming potential (GWP) of the various GHGs is assigned as a measure of their relative average global radiative forcing effect, the potential of a gas or aerosol to trap heat in the atmosphere. Individual GHG species have varying GWP and atmospheric lifetimes. The carbon dioxide equivalent is a consistent methodology for comparing GHG emissions since it normalizes various GHG emissions to a single metric. The reference gas for GWP is carbon dioxide with a GWP of one and GWP weighted emissions are measured in terms of CO_2 equivalents (CO_2E) (EPA 2008). For example, methane has a GWP of 21; methane has a 21 times greater global warming effect than carbon dioxide on a weight basis (EPA 2008). Several GWPs of other GHGs are shown in Table 1 below:

Table 1: Global Warming Potential of GHGs

Gas	Atmospheric Lifetime	GWP
Carbon dioxide (CO2)	50 – 200	1
Methane (CH4)	12 ± 3	21
Nitrous oxide (N2O)	120	310
HFC-23 (Hydrofluorocarbons)	264	11,700
HFC-32	5.6	650
HFC-125	32.6	2,800
HFC-134a	14.6	1,300
HFC-143a	48.3	3,800
HFC-152a	1.5	140
HFC-227ea	36.5	2,900
HFC-236fa	209	6,300
HFC-4310mee	17.1	1,300
CF4 (Perfluorocarbons)	50,000	6,500
C2F6	10,000	9,200
C4F10	2,600	7,000
C6F14	3,200	7,400
Sulfer hexafluoride (SF6)	3,200	23,900

1.2 Legislation Relative to Addressing GHG Impacts

Executive Order S-3-05

In response to the increasing body of evidence that GHGs will continue to affect global climate, Governor Schwarzenegger issued executive order (EO S-3-05) in June 2005, which established several greenhouse gas emission reduction targets for California. GHG emissions are to be reduced to 2000 emission levels by 2010; to 1990 emission levels by 2020 (a 29% reduction from business as usual emissions levels projected for 2020) (CARB 2008)); and to 80% below 1990 levels by 2050.

Assembly Bill 32 (AB32)

Subsequent to the Governor's issuance of EO S-3-05, the California State Legislature adopted Assembly Bill (AB) 32 – The California Global Warming Solutions Act of 2006. AB 32 establishes a cap on statewide greenhouse gas emissions and sets forth the regulatory framework to achieve the corresponding reduction in statewide emissions levels. Specifically, AB 32 recognizes a serious threat to the "economic wellbeing, public health, natural resources, and the environment of California" that results from global warming. Consequently, AB 32 mandates a significant reduction in GHGs in order to contribute to efforts to stabilize atmospheric concentrations of GHGs. Specifically, AB 32 requires the California Air Resources Board (ARB) to do the following:

- By July 1, 2007, adopt a list of early action measures that can be implemented by regulation before January 2010.
- By January 1, 2008, adopt mandatory reporting requirements for significant sources.
- By January 1, 2008, establish a statewide GHG emission cap for 2020 based upon 1990 emissions levels.
- By January 1, 2009, adopt a plan (Scoping Plan) indicating how emission reductions will be achieved for significant GHG sources via regulations, market mechanisms, or other measures, to reach the 2020 emissions goal.
- By January 1, 2011, adopt regulations to achieve the maximum technologically feasible and cost effective reductions in GHG.

In addition, ARB is to:

- Convene an Environmental Justice Advisory Committee and an Economic and Technology Advancement Advisory Committee to advise ARB.
- Ensure public notice and opportunity for comments for all actions.
- Prior to imposing any mandates or authorizing market mechanisms, to evaluate several factors, including but not limited to: impacts on California's economy, the environment, and public health; equity between regulated entities; electricity reliability, conformance with other environmental laws, and to ensure that the rules do not disproportionately impact low-income communities.

For further information, see www.climatechange.ca.gov/ab32/index.html

Other key legislation:

- California Environmental Quality Act (CEQA): CEQA requires public agencies in California to analyze potential adverse impacts for proposed projects undertaken by a public agency, funded by a public agency, and requiring discretionary approval by a public agency. The fundamental purposes of CEQA are to inform governmental decision-makers and the public about the significant environmental effects of proposed activities, identify ways to avoid or significantly reduce environmental damage, use feasible alternatives or mitigation measures to avoid significant damage, and disclose to the public why a governmental agency approved a project if significant effects are involved (CEQA Guidelines §15002[a]). To disclose potential adverse impacts from a proposed project, pursuant to CEQA lead agencies typically prepare multidisciplinary environmental impact analysis and make decisions based on the analysis regarding the environmental effects of the proposed project (CEQA Guidelines §15002[a]). The guidelines are available at: http://ceres.ca.gov/ceqa/guidelines/

- Senate Bill (SB) 97 – CEQA: Greenhouse Gas Emissions: In August 2007, Governor Schwarzenegger signed into law Senate Bill (SB) 97 – CEQA: Greenhouse Gas Emissions. SB 97 requires the Office of Planning and Research, by July 1, 2009, to prepare, develop, and transmit to the Resources Agency guidelines for the feasible mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions, as required by CEQA, including, but not limited to, effects associated with transportation or energy consumption. The Resources Agency would be required to certify and adopt those guidelines by January 1, 2010. The Office of Planning and Research would be required to periodically update the guidelines to incorporate new information or criteria established by ARB pursuant to the California Global Warming Solutions Act of 2006. SB 97 also identifies a limited number of types of projects that would be exempt under CEQA from analyzing GHG emissions. Finally, the legislation will be repealed on January 1, 2010. For further information, see http://opr.ca.gov/index.php?a=ceqa/index.html

- Office of Planning and Research (OPR) Technical Advisory: Consistent with SB 97, on June 19, 2008, OPR released its *Technical Advisory on CEQA and Climate Change*, which was developed in cooperation with the Resources Agency, the California Environmental Protection Agency (Cal/EPA), and the ARB. The *Technical Advisory* offers the informal interim guidance regarding the steps lead agencies should take to address climate change in their CEQA documents, until CEQA guidelines are developed pursuant to SB 97 on how state and local agencies should analyze, and when necessary, mitigate greenhouse gas emissions (OPR).

  According to OPR, lead agencies should determine whether greenhouse gases may be generated by a proposed project, and if so, quantify or estimate the GHG emissions by type and source. Second, the lead agency must assess whether those emissions are individually or cumulatively significant. When assessing whether a project's effects on climate change are "cumulatively significant" even though project specific GHG contribution may be individually limited, the lead agency must consider the impact of the project when viewed in connection with the effects of past, current, and probable future projects. Finally, if the lead agency determines that the GHG emissions from the project as proposed are potentially significant, it must investigate and implement ways to avoid, reduce, or otherwise mitigate the impacts of those emissions.

On April 13, 2009, the Governor's Office of Planning and Research sent proposed amendments of the CEQA Guidelines to the Secretary of the Resources Agency for promulgation. The proposed amendments contain Model Policies for GHGs in General Plan. OPR recommended changes to fourteen sections of the existing guidelines, including: the determination of significance as well as thresholds; statements of overriding consideration; mitigation; cumulative impacts; and specific streamlining approaches. The proposed Guidelines also include an explicit requirement that environmental impact reports (EIRs) analyze GHG emissions resulting from a project when the incremental contribution of those emissions may be significant. A copy of the full proposal, as well as the letter of transmittal, may be found at: www.opr.ca.gov.

- SB 375 (Steinberg) Transportation, Land Use, and the California Environmental Quality Act (CEQA): On September 30, 2008, Governor Schwarzenegger signed into law SB 375 (Steinberg). SB 375 focuses on housing and transportation planning decisions to reduce fossil fuel consumption and conserve farmlands and habitat. This legislation is important to achieving AB 32 goals because greenhouse gas emissions associated with land use, which includes transportation, are the single largest sector of emissions in California. Further, SB 375 provides a path for better planning by providing incentives to locate housing developments closer to where people work and go to school, allowing them to reduce vehicle miles traveled every year. Finally, SB 375 provides certain exemptions under CEQA law for projects that are proposed consistent with local plans developed under SB 375. The bill is available here: http://www.leginfo.ca.gov/pub/07-08/bill/sen/sb_0351-0400/sb_375_bill_20080930_chaptered.html

1.3 California Environmental Quality Act (CEQA)

The California Legislature enacted CEQA in 1970. CEQA is intended to address a broad range of environmental issues, including water quality, noise, land use, natural resources, transportation, energy, human health, biological species, and air quality. CEQA requires that public agencies (i.e., local, county, regional, and state government) consider and disclose the environmental effects of their decisions to the public and governmental decision makers. Furthermore, CEQA mandates that agencies implement feasible mitigation measures or alternatives that would mitigate significant adverse effects on the environment. A significant effect on the environment is defined as a substantial adverse change in the physical conditions which exist in the area affected by the proposed project. This determination of significance must be based on the substantial evidence in light of all the information before the agency.

1.4 The District's Role in the CEQA Review Process

The District has jurisdiction over most air quality matters in the San Joaquin Valley Air Basin and is tasked with implementing certain programs and regulations required by the Federal Clean Air Act and the California Clean Air Act. As parts of the effort to accomplish its mandates, the District has prepared plans to attain national and state ambient air quality standards, conducts a CEQA review program, and maintains a staff of technical personnel versed in air pollution analysis and control. In addition, CEQA Guidelines §15004(b)(2) require a lead agency to consult with *"Any other state, federal, and local agencies which have jurisdiction by law with respect to the project or which exercise authority over resources which may be affected by the project…."*

Nearly all development projects in the San Joaquin Valley Air Pollution Control District, from general plans to individual development applications, have the potential to generate pollutants that will worsen air quality or make it more difficult for national and state air quality attainment standards to be attained. Therefore, for most projects, it is necessary to evaluate air quality impacts to comply with CEQA.

As a public agency, the District takes an active part in the intergovernmental review process under CEQA. The District is available to assist governmental agencies and project proponents in understanding how to characterize project related impacts on air quality and how to mitigate those impacts. The District provides technical guidance on applicable air quality analysis methodologies, identifies applicable rules, proposes mitigation measures, and helps address any other air quality related issues.

In carrying out its duties under CEQA, performs several agency roles: the District may act as a Lead Agency, a Responsible Agency, or a "Commenting" Agency. As discussed below, the role the District serves under CEQA is dependent upon the extent of the District's discretionary approval power over the project.

Lead Agency – A Lead Agency is the public agency with the principal responsibility for carrying out or approving a project subject to CEQA. Lead Agencies are responsible for complying with CEQA by ensuring that the potential environmental impacts of projects are adequately assessed. This may include determining that a project is exempt from CEQA, or preparing a Negative Declaration, or an Environmental Impact Report (EIR) for nonexempt, potentially significant projects. Lead Agencies must also consult with and solicit comments from responsible and commenting agencies during the preparation of a Negative Declaration or EIR.

In general, the local government agency with jurisdiction over land use, such as a city or county, is the preferred Lead Agency for land development projects. The District will undertake the Lead Agency role when no other agency has broader responsibility for approving the project; the project requires a discretionary District permit; and no other agency has prepared (or is preparing) a CEQA document for the project. In addition, the District routinely serves as Lead Agency for its own projects, such as the development of rules and regulations.

Responsible Agency – A Responsible Agency is a public agency, other than the Lead Agency, that has responsibility for carrying out or approving a project. The role of a Responsible Agency is different from that of a Lead Agency. While a Lead Agency must consider all of the potential impacts of a project, a Responsible Agency may only consider those aspects that are within the agency's area of expertise or which are required to be carried out or approved by the agency. A Responsible agency complies with CEQA by considering the Negative Declaration or EIR prepared by the Lead Agency and by reaching its own conclusion on whether or how to approve the project involved.

The District is typically a Responsible Agency for projects or portions of a project that require a District permit, or that require any other approval by the District. When considering the lead agency's environmental analysis, the District will review the air quality section of the analysis and other sections relevant to assessing potential impacts on air quality, i.e. sections assessing traffic and public health impacts. At the conclusion of its review, the District may submit comments to the lead agency that identify any deficiencies in the air quality analysis and suggest approaches to correct the deficiencies. Where appropriate, the District may recommend additional feasible mitigation measures.

Commenting Agency – Under CEQA, an agency that has "jurisdiction by law" over a particular natural resource, but does not have discretionary approval over the project is a "Trustee Agency", otherwise known as a "Commenting Agency". The District serves as a Commenting Agency when reviewing projects which typically do not require air permits, e.g. residential and commercial development projects. In addition to the air quality section, the District may review and comment on other sections of the environmental document that relate to air quality impacts, e.g. traffic, health risks, etc. When serving as a Commenting Agency, the District may provide the Lead Agency comments on the adequacy of the air quality analysis; identify District rules which apply to the project, and may recommend potential mitigation measures for the Lead Agency's consideration.

Identifying significant air quality impacts and mitigation early in the development of a project will allow fundamental design changes for the benefit of air quality at the lowest possible cost. The District is available for consultation at any time during the project review process, but there are certain times when consultation is required. For example, when the District has discretionary approval authority over a project for which another public agency is serving as Lead Agency, the District is to be consulted as a Responsible Agency. When the District does not have any discretionary approval authority over a project, but the project may impact air quality, the District is to be consulted as a Commenting Agency.

1.5 CEQA and GHG Emissions

General scientific consensus and increasing public awareness regarding global warming and climatic change have placed new focus on the CEQA review process as a means to address the effects of GHG emissions from proposed projects on climatic change. Senate Bill 97, as discussed above, amends the CEQA statute to clearly establish that GHG emissions and the effects of GHG emissions are appropriate subjects for CEQA analysis. It directs the Governor's Office of Planning and Research to develop draft CEQA Guidelines "for the mitigation of greenhouse gas emissions or the effects of green house gas emissions" by July 1, 2009 and directs the Resource Agency to certify and adopt CEQA Guidelines by January 1, 2010. However, at this time there are no generally accepted thresholds of significance for determining the impact of GHG emissions from an individual project on global climatic change.

Although AB 32 gives wide responsibility to ARB to regulate GHG emissions from all sources, including non-vehicular sources, it does not preempt or excuse permitting agencies from addressing GHGs under CEQA. Under state law, it is the purview of each lead agency to determine what, if any, significance thresholds will be established to guide its review of projects under CEQA. Traditionally, the District has provided local lead agencies technical guidance for assessing a project's potential impact on air quality, including establishment of significance thresholds for criteria pollutants. The District's Climate Change Action Plan is being developed consistent with the District's traditional role of providing local lead agencies technical guidance for assessing a project's potential impact on air quality, including establishment of significance thresholds for criteria pollutants.

CHAPTER 2

CLIMATE CHANGE ACTION PLAN MISSION

2.1 Purpose of the Climate Change Action Plan

California's Global Warming Solutions Act of 2006 (AB 32) includes a large number of initiatives to reduce GHG emissions state wide. These initiatives are discussed in ARB's AB 32 Scoping Plan, which was approved for adoption by ARB in December 2008.

AB 32 and the AB 32 Scoping Plan do not yet impose direct mandates on local Air Districts. However, the draft AB 32 Scoping Plan includes mandates on land use agencies and businesses which often look to the District for technical assistance. As such, the District can play a supportive role and be a leader in facilitating compliance with AB 32 for Valley land use agencies and businesses.

The goals of the CCAP are to establish District processes for assessing the significance of project specific GHG impacts for projects permitted by the District; assist local land use agencies, developers, and the public by identifying and quantifying GHG emission reduction measures for development projects and by providing tools to streamline evaluation of project specific GHG effects; ensure that collateral emissions from GHG emission reduction projects do not adversely impact public health or environmental justice communities in the Valley; and assist Valley businesses in complying with state law related to GHG emission reduction. For other agencies, including lead agencies, the proposed process for assessing project specific significance is offered as guidance and is not to be interpreted as a mandate.

The District believes that thoughtful and well documented guidance by the District designed to help local land-use agencies to properly address climate change issues in the CEQA documents, and assistance by the District in identifying and implementing GHG mitigation measures, can be beneficial by bringing structure and relative certainty to the CEQA process.

The District can also assist Valley businesses in complying with AB 32 requirements in other ways. The District's long-standing relationship with Valley businesses has yielded a comprehensive regulatory infrastructure that we hope to use to facilitate efficient and streamlined compliance with many of the upcoming AB 32 requirements.

2.2 District Governing Board CCAP Mandates

In August 2008 the District's Governing Board adopted the Climate Change Action Plan (CCAP). The CCAP authorized the Air Pollution Control officer (APCO) to develop guidance documents to assist land use agencies and other permitting agencies in addressing GHG emissions as part of the CEQA process, investigate the development of a greenhouse gas banking program, enhance the existing emissions inventory process to include greenhouse gas emissions reporting consistent with new state requirements, and administer voluntary greenhouse gas emission reduction agreements. Except for the latter two, which can be implemented immediately, the APCO's recommendations for accomplishing these initiatives would then be brought before the Governing Board for their additional consideration.

The balance of this staff report focuses solely on various issues concerning the development of District guidance for addressing project related greenhouse emissions during the CEQA process. This paper does not address the other items called for in the CCAP.

2.2.1 Greenhouse Gas Guidance for CEQA

CEQA requires lead agencies to identify potentially significant effects on the environment of projects they intend to carry out or approve and to mitigate significant effects whenever it is feasible to do so.

For projects with GHG emissions, determining if the GHG emissions are significant involves three steps:

- Identify and quantify GHG emissions.
- Assess the significance of the GHG emissions on the environment.

- If the GHG emissions are found to be significant, identify alternatives and/or mitigation measures that will reduce the impact of the GHG emissions below significance.

The CCAP authorizes the APCO to develop guidance and procedures for assessing the significance of project-related GHG emissions. By establishing a GHG significance level, or developing some alternative method to address GHG impacts, the uncertainty of characterizing the impacts on GCC during the CEQA process will be reduced for both lead agencies and project proponents. Also, for projects that are determined to have significant GHG emissions, or otherwise require GHG mitigation to reduce or offset the GHG emissions, sources of potential and approvable GHG mitigation must be clearly identified.

2.2.2 Carbon Exchange Program

The CCAP authorized the APCO to develop regulations and procedures for a greenhouse gas emission reduction banking system. This voluntary banking system, the San Joaquin Valley Carbon Exchange (SJVCE), would provide a mechanism for the voluntary banking of GHG emission in the San Joaquin Valley.

The outcome of stakeholder meetings will be considered when determining if the SJVCE should be developed. At the conclusion of such meetings, the District may determine that a rule to establish a SJVCE should be developed or that a SJVCE is not warranted.

A District administered GHG banking system may be beneficial to stakeholders in the District for the following reasons:

- Banked GHG emission reductions could be used to provide mitigation for CEQA,
  - GHG emission reductions could possibly be used for compliance with AB32,
  - Promote the early reductions of GHGs and their associated criteria and toxic pollutants in the District (especially in environmental justice areas),
  - Provide a mechanism for the trading of GHG emission reductions,
  - Provide a measure of certainty of banked GHG emission reductions due to the District's extensive experience in banking criteria pollutant emissions, and
  - Provide a mechanism for persons to purchase and retire banked GHG emission reductions for societal benefit.

The goals would be to provide a mechanism to preserve high quality greenhouse gas (GHG) emission reductions and encourage such reductions that have no or minimal collateral criteria or toxic pollutant emission increases, or in fact that create co-beneficial reductions in such emissions.

A SJVCE technical workgroup consisting of District staff, land use agency representatives, industry representatives, agricultural representatives, environmental group representatives, and other interested parties was formed to study the feasibility and need for the SJVCE. This group met three times in late 2008 and early 2009. In parallel to this effort, this workgroup developed a "Report to the APCO Regarding Development of the San Joaquin Valley Carbon Exchange". Currently, the development of a GHG emission reduction registry is being addressed via amendments to Rule 2301 *Emission Reduction Credit Banking*. The latest version of the report and related information to the progress of Rule 2301 are available at http://www.valleyair.org/Programs/CCAP/CCAP_idx.htm.

2.2.3 Voluntary Greenhouse Gas Mitigation Agreements

The CCAP authorizes the APCO to develop guidance and procedures for implementing a program by which project proponents can voluntarily enter into contractual arrangements with the District to fund projects, mitigating their projects cumulative impact on GCC. CEQA Guidelines clearly recognize the use of fee payments as mitigation for a project's otherwise cumulatively significant impacts. A project's contribution is less than cumulatively significant if the project is required to implement or fund its fair share of a mitigation measure or measures designed to alleviate the cumulative impact (CEQA Guidelines § 15130, subd. (a)(3)).

The District has considerable experience with the use of voluntary emission reduction agreements to mitigate impacts of criteria pollutants. In the past, the District has used its grant program (Emissions Reduction Incentive Program), to successfully mitigate impacts of criteria pollutants resulting from growth and development projects occurring within the San Joaquin Valley. To date, the program has resulted in permanent emission reductions totaling 1,074.57 tons NOx, 42.51 tons PM and 125.76 tons of VOC. The District's current mitigation program could readily be expanded to include mitigation of GHG emissions.

Conceptually, project proponents required to mitigate their GHG emissions as part of the CEQA process would enter into voluntary mitigation agreements with the District. Each mitigation agreement would be subject to Governing Board approval. Under such a voluntary agreement, the project proponent would provide funding to the District in amounts necessary to obtain the needed reduction in GHG emissions. The District would accept funds from project proponents and through its grant program fund projects that would achieve the required GHG emission reductions.

The cost of bringing about GHG emission reductions can vary widely. In determining which projects to fund, priority would likely be given to those projects that are the most cost effective. Project's that also result in reductions of criteria and toxic air pollutants, and are located in environmental justice areas would be given priority in the funding process. Funds from individual mitigation agreements could be pooled together to provide sufficient funding for large GHG emission reduction projects. When the emission reduction projects are implemented by the grant recipients, the emissions reductions monitored, verified, and enforced by the District, thus guaranteeing that the mitigation does indeed occur.

Separately, the California Attorney General (AG) has required some projects to mitigate their GHG emissions through the payment of mitigation funds. In fact, for several projects in the District, the District may enter into memorandums of understanding (MOUs) with the AG to accept these funds and obtain GHG emission reductions on behalf of the project proponent.

District staff is currently preparing an analysis of potential GHG reduction projects that might be funded through grants administered by the District. This analysis will include individual project-types, their potential for generating GHG reductions, the cost effectiveness of the reductions, and an assessment of various criteria for considering collateral criteria emission reduction benefits (i.e., how to recognize the benefits of projects that reduce both GHG and criteria pollutants).

2.3 Proposed Timeline and Method to Achieve the CCAP Goals

The District held its first CCAP scoping meeting on November 18, 2008. During this meeting, the District presented the objectives of the proposed CCAP and solicited volunteers to participate in the GHG CEQA Guidance technical workgroup. To receive the broadest input possible, the District sought participation from industry representatives, local Land Use Agency members, other Public Agency members, environmental group representatives and any other interested party.

Three ad hoc committees were formed to evaluate the project scope and quantify GHG emissions resulting from one industrial and one non-industrial project, and to provide guidance/recommendation to be applied when determining the significance and mitigation of project specific GHG emissions during the CEQA environmental review process. Numerous discussions were coordinated on these key issues over 16 conference calls and meetings that were held between December 2008 and March 2009.

District staff conducted a public workshop on May 5 and June 30, 2009 to present, discuss, and receive comments on District's draft guidance for addressing GHG under CEQA. The public hearing is tentatively scheduled to take place in the last quarter of 2009. This staff report for the proposed CCAP containing District's recommendation to the APCO will be revised, published and mailed to affected sources and interested parties prior to a public hearing to consider the adoption of proposed guidance by the District Governing Board.

CHAPTER 3

CURRENT STATUS: ADDRESSING PROJECT GHG IMPACTS

3.1 Introduction

Public agencies, including the California Air Resources Board, and other air districts, are striving to determine the appropriate means by which to evaluate the impact of GHG emissions at the project level. The following discussion summarizes various approaches and methodologies for addressing GHG emissions, as well as possible mitigation measures that are being considered.

The following sections summarize the activities of various agencies and groups concerning the role of GHGs in the CEQA process.

3.2 Environmental Protection Agency

The U.S. Environmental Protection Agency (EPA) has made available a large volume of information on greenhouse gases including their nature, impact, emissions inventory, and emissions trend and projections. However, none of the available information addresses or evaluates specific approaches on how to comply with the CEQA requirements, as CEQA is a California-specific law.

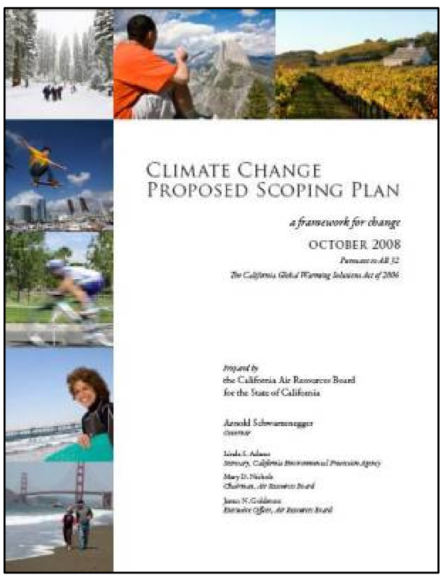
It is important to note that EPA has published an Advanced Notice of Proposed Rulemaking: Regulating Greenhouse Gas Emissions under the Clean Air Act (http://www.epa.gov/climatechange/anpr.html). This notice asks for public input on the appropriateness of regulating GHGs under the Federal Clean Air Act, and if appropriate, the form that regulation would take. The comment deadline for this notice was November 28, 2008. EPA is not expected to act further on this notice anytime soon, but because activities on the federal level have the potential to circumvent or replace local actions, all interested parties should watch and participate in this federal process.

In addition, after a thorough scientific review ordered in 2007 by the U.S. Supreme Court EPA issued in April 17, 2009 a proposed finding that greenhouse gases (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons and sulfur hexafluoride) contribute to air pollution that may endanger public health or welfare. This proposed finding is now under a public comment period.

3.3 California Air Resources Board (ARB)

3.3.1 ARB Scoping Plan

ARB developed a scoping plan addressing AB 32 requirements according to specific deadlines. The AB 32 Scoping Plan[2] contains the main strategies California will use to reduce greenhouse gases (GHG) that cause climate change. The Scoping Plan has a range of GHG reduction actions which include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, and market-based mechanisms such as a cap-and-trade system. The Proposed Scoping Plan was released on October 15, 2008 and approved at ARB's Board hearing on December 12, 2008. The Scoping Plan now requires ARB and other state agencies to adopt regulations and other initiatives reducing GHGs. The majority of the work must be completed by December 31, 2010 with most regulations and other initiatives going into effect by January 1, 2012.



The scoping plan contains the main strategies California will use to reduce greenhouse gases (GHG) from business-as-usual emissions projected from 2020 levels back down to 1990 levels. Business-as-usual (BAU) is the projected emissions in 2020, including increases in emissions caused by growth, without any greenhouse gas reduction measures. The Scoping Plan has a range of GHG reduction actions which include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, and market-based mechanisms such as a cap-and-trade system.

[2] *Climate Change Proposed Scoping Plan*. California Air Resources Board, October 2008

3.3.2 GHG Baseline and Business-as-Usual Emissions

Senate Bill 1771 directed the California Energy Commission (CEC) to determine the statewide GHG emissions inventory by January 2002 and to update it every five years thereafter. As of January 1, 2007, the responsibility for updating the GHG inventory was transferred to ARB per Assembly Bill 1803.

Baseline
The California Air Resources Board (CARB) used its emission inventory to establish the Baseline upon which changes in GHG emissions would be evaluated. The Baseline consists of a three-year average for GHG emissions occurring by sector during the baseline period of 2002-2004. The Baseline Period GHG emissions include emissions from all sources in ARB's emissions inventory, including both, old and new, large and small GHG emission sources.

Business-as-Usual
Business-as-usual (BAU), as established by CARB, is a projected emissions inventory and does not represent actual business or operational practices generating GHG emissions. To establish BAU, ARB projected the Baseline Period emissions to the year 2020, using assumptions about potential growth, assuming no change in the existing business practices, and without considering implementation of any GHG emission reduction measures.

ARB 29%GHG Emission Reduction Target
As presented in the Scoping Plan[3], ARB estimated the 2020 BAU greenhouse gas emissions to be 596 $MMTCO_2E$. The State's GHG emissions level in 1990 was approved by ARB in December 2007 to be 427 $MMTCO_2E$. This sets the 2020 GHG emissions target. The resulting BAU estimate of 596 MMT is compared to the 2020 target of 427 MMT to determine the total statewide GHG reductions needed. The 2020 target of 427 $MMTCO_2E$ requires the reduction of 169 $MMTCO_2E$, or approximately 29%, from the state's projected 2020 BAU emissions and the reduction of 42 $MMTCO_2E$, or almost 10 percent, from 2002-2004 average emissions.

$$29\%\,\text{Total Reduction} = \frac{596\,\text{MMTCO2e}(2020\,\text{BAU Emissions}) - 427\,\text{MMTCO2e}(2020\,\text{Target Emissions})}{596\,\text{MMTCO2e}(2020\,\text{BAU Emissions})}$$

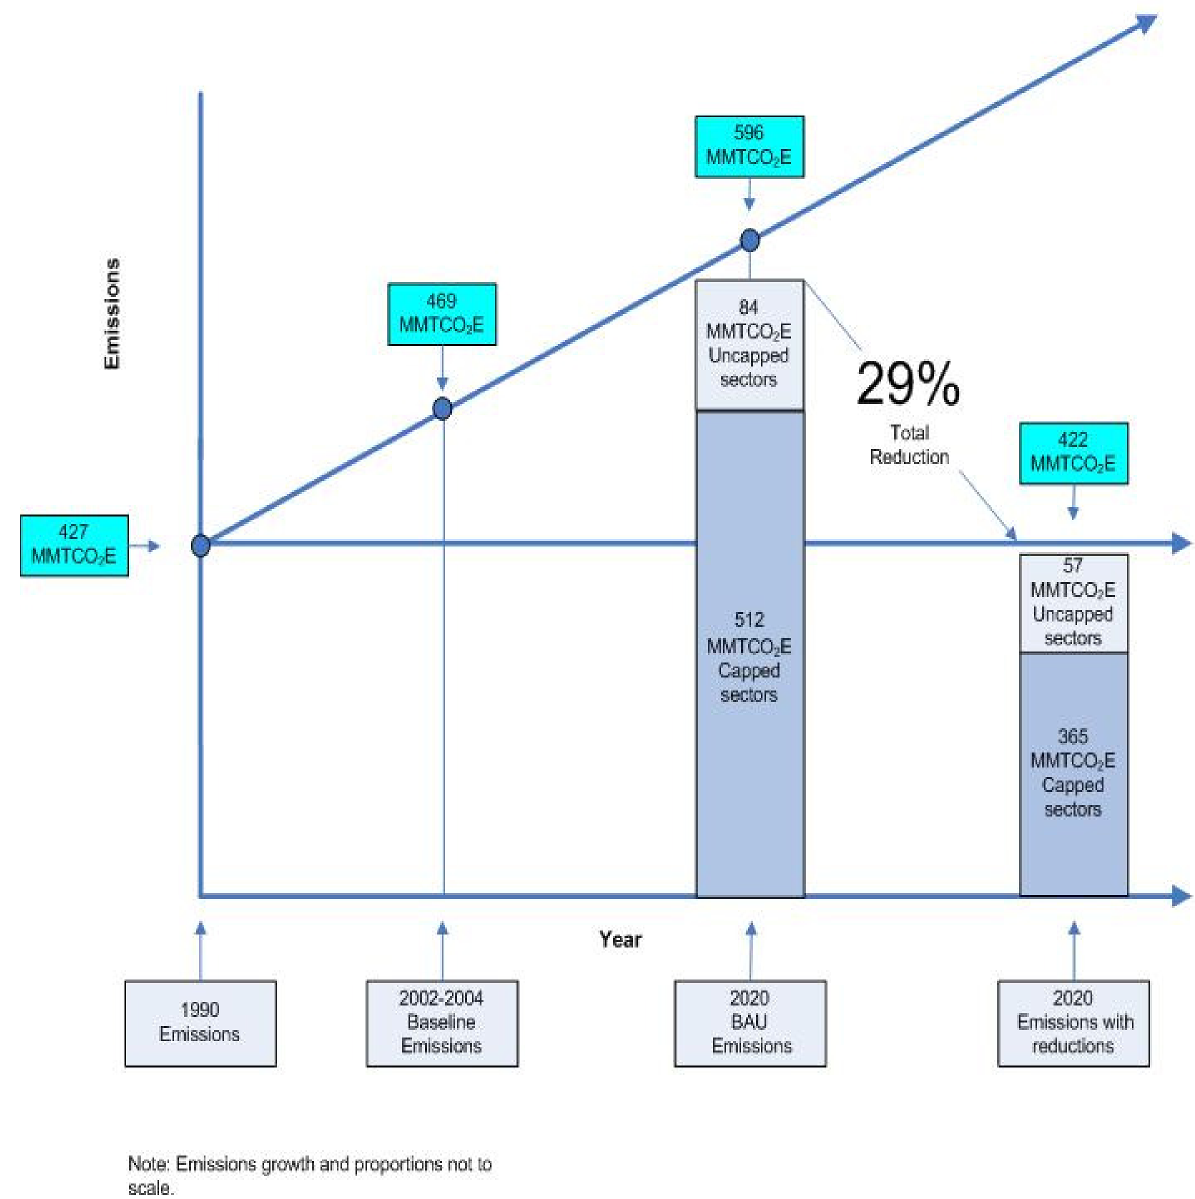
ARB has identified reduction measures totaling 174 $MMTCO_2E$ in the Scoping Plan that would achieve reductions from sources within the cap-and-trade sectors (capped) by 146.7 $MMTCO_2E$ and from sources not covered by cap-and-trade (uncapped) by 27.3 $MMTCO_2E$. With a total projected BAU emission by 2020 of 596 $MMTCO_2E$, the projected total

[3] *Climate Change Proposed Scoping Plan;* P. 12 and 21. California Air Resources Board, October 2008

emission after reductions would be 422 $MMTCO_2E$ of which 365 $MMTCO_2E$ from capped sectors and 57 $MMTCO_2E$ from uncapped sectors.

Figure 2 below illustrates the 1990 state's GHG emissions and 2020 reductions as proposed in the Scoping Plan[4].

Figure 2: California Greenhouse Gas Emissions in 2020



[4] *Climate Change Proposed Scoping Plan;* P. 12 and 21. California Air Resources Board, October 2008

3.3.3 GHG Emission Reduction Measures and Cap-and-Trade Principles

The AB 32 Scoping Plan evaluated a comprehensive array of approaches and tools identifying GHG emission reduction measures to achieve the 1990 GHG emission level target. ARB concluded that reducing GHG emissions from a wide variety of sources can best be achieved through establishment of a cap-and-trade program. A cap-and-trade program establishes an enforceable limit (or cap) on the aggregate total emissions for those entities covered by the program.[5] As proposed by ARB, the State would establish a cap for each compliance period of the program, and emission reductions would increase as the cap declines over time. A key component of a cap-and-trade program is a permit to emit one unit of GHG emissions, typically called an allowance. Allowances are issued in the program in an amount equal to the total emissions limit for a compliance period. At the end of the compliance period, all entities in a cap-and-trade program must surrender allowances equal to their total emissions during the compliance period.

The limited number of allowances issued creates a binding cap on emissions. The State would issue fewer allowances over time, thus ensuring declining emissions. Failure to surrender allowances equal to emissions results in significant penalties. New facilities that begin operation in sectors subject to cap-and-trade would be required to obtain allowances through an auction, from a reserve, or from other allowance holders. This process provides a mechanism for new facilities to operate, while guaranteeing that there is no increase in overall GHG emissions when new facilities are built.

The proposed cap-and-trade would include up to 85 percent of the State's emission sources by 2020, covering electricity, transportation fuels, natural gas, and industrial sectors. ARB estimates that, the cap-and-trade would reduce overall state-wide GHG emissions by 147 $MMTCO_2E$[6] from projected BAU in 2020.

Cap-and-trade programs are market-driven, and do not specify how emission reductions will be achieved. Emissions reductions will be achieved at the facility level using the most cost-effective methods available. Emission reductions achieved through compliance with other emission reduction measures count towards achieving the facility's cap, thus reducing the need to obtain allowances. Furthermore reductions achieved on site have a potential collateral benefit of reducing criteria pollutant emissions.

[5] For further discussion of cap-and-trade see: *Climate Change Proposed Scoping Plan Appendix C, Cap and Trade*, pp. 11 – 24. California Air Resources Board, October 2008

[6] *Climate Change Proposed Scoping Plan,* pp. 16 and 21. California Air Resources Board, October 2008

3.3.4 ARB's Preliminary Recommendations for Significance Thresholds

On October 24, 2008, ARB released its Preliminary Draft Staff Proposal, *Recommended Approaches for Setting Interim Significance Thresholds for Greenhouse Gases under the California Environmental Quality Act.* ARB staff believes that zero thresholds are not warranted in light of the fact that (1) some level of emissions in the near term and at mid-century is still consistent with climate stabilization and (2) current and anticipated regulations and programs apart from CEQA will proliferate and increasingly will reduce the GHG contributions of past, present, and future projects. But any non-zero threshold must be sufficiently stringent to make substantial contributions to reducing the State's GHG emissions peak, causing that peak to occur sooner, and putting California on track to meet its interim (2020) and long-term (2050) emissions reduction targets.

The Proposed Scoping Plan was released on October 15, 2008 and approved at ARB's Board hearing on December 12, 2008. The Scoping Plan now requires ARB and other state agencies to adopt regulations and other initiatives reducing GHGs. The majority of the work must be completed by December 31, 2010 with most regulations and other initiatives going into effect by January 1, 2012.

A key aspect of ARB's approach is to recognize that different GHG thresholds of significance may apply to projects in different sectors. Two primary reasons that sector-specific thresholds are appropriate are: (1) some sectors contribute more substantially to the problem, and therefore should have a greater obligation for emissions reductions, and, (2) looking forward, there are differing levels of emissions reductions expected from different sectors in order to meet California's climate objectives. ARB also believes that different types of thresholds – quantitative, qualitative, and performance-based – can apply to different sectors under the premise that the sectors can and must be treated separately given the state of the science and data. A sector-specific approach is consistent with ARB's proposed Scoping Plan.

<u>Stationary Sources</u>
ARB staff's objective is to develop a threshold of significance that will result in the vast majority (~90% statewide) of the greenhouse gas (GHG) emissions from new stationary source projects being subject to CEQA's requirement to impose feasible mitigation. ARB staff believes this can be accomplished with a threshold that allows small projects to be considered insignificant. ARB staff used existing data for the industrial sector to derive a proposed hybrid threshold. The threshold consists of a quantitative threshold of 7,000 metric tons of CO_2 equivalent per year ($MTCO_2E$/year) for operational emissions (excluding transportation), and performance standards for construction and transportation emissions (CARB). The goal

of this effort is to provide for the mitigation of GHG emissions from industrial projects on a statewide level. Over time, implementation of AB 32 will reduce or mitigate GHG emissions from stationary sources. Once such requirements are in place, they could become the performance standard for stationary projects for CEQA purposes. ARB staff intends to pursue this approach in conjunction with development of the regulatory requirements for stationary sources in the Proposed AB 32 Scoping Plan. Staff is proposing the use of a quantitative significance threshold at least until such time that performance standards, such AB 32 regulatory requirements, are in place to ensure mitigation of significant impacts of GHG emissions from projects in the industrial sector.

ARB determined that GHG emissions from stationary sources are dominated by combustion emissions. To ensure that significant stationary emissions would be captured by the proposed threshold, ARB staff evaluated industrial boilers because they are a very common piece of equipment, are essential in many energy-intensive industries, and are a top contributor to stationary combustion emissions. A recent comprehensive survey of industrial boilers found that boilers with an input capacity of 10 MMBtu/hr or greater correspond to 93 percent of total industrial boiler input capacity. Based on this data, ARB staff used a natural gas boiler input capacity benchmark of 10 MMBtu/hr which equates to emissions of 4,660 $MTCO_2E$/yr. This capacity benchmark defines a significant combustion source. Per ARB's analysis, combustion processes account for 63 percent of the statewide GHG emissions from industrial facilities. Process losses, purchased electricity, and water use and water treatment account for the remaining 27 percent of emissions.

Based on the available data, ARB concludes in its draft proposal that the 7,000 $MTCO_2E$/year benchmark can be used to effectively mitigate industrial projects with significant GHG emissions.

<u>Residential and Commercial Developments</u>

ARB's preliminary draft proposal for residential and commercial projects recognizes the potential for using a performance standard based approach. Projects complying with a previously approved plan that addresses GHG emissions, satisfies CEQA section 15064(h)(3), and that has all of the following attributes could be presumed to have a less than significant impact:

- Project meets a community level GHG target consistent with statewide AB 32 emission limits; and
- Is consistent with a transportation related GHG reduction target adopted by ARB pursuant to SB 375; and
- Includes a GHG inventory and mechanisms to regularly monitor and evaluate emissions; and
- Includes specific enforceable GHG requirements; and

- Incorporates mechanisms that all the plan to be revised to meet targets; and
- Has a certified final CEQA document.

Projects failing to meet the above criteria would go through a second tier analysis. As proposed, Tier II would contain both performance standards and a numerical (X) significance threshold. Projects could be presumed to have a less than significant impact if they met the following minimum performance standards and were below the X threshold of significance:

- Meets an interim ARB performance standard for construction related emissions; and
- Meets an energy use performance standard defined as CEC's Tier II energy efficiency goal; and
- Meets an interim ARB performance standard for water use; and
- Meets an interim ARB performance standard for waste; and
- Meets an interim ARB performance standard for transportation; and
- The project, with performance standards or equivalent mitigation would emit no more than X metric tons CO_2E/year.

It should be noted that ARB has solicited comments regarding whether to include an X factor. As of today, ARB has not finalized its recommendation, and has not scheduled any additional workshops or hearings on the draft proposals.

3.4 Office of Planning and Research (OPR)

OPR Recommendations

On or before January 1, 2010, The Governor's Office of Planning and Research (OPR) will develop, and the California Resources will certify and adopt amendments to the Guidelines providing regulatory guidance on the analysis and mitigation of GHG emissions in CEQA documents. On April 13, 2009, OPR submitted to the Secretary for Natural Resources its proposed amendments to the state CEQA Guidelines for greenhouse gas emissions, as required by Senate Bill 97 (Chapter 185, 2007). These proposed CEQA Guideline amendments would provide guidance to public agencies regarding the analysis and mitigation of the effects of greenhouse gas emissions in draft CEQA documents. The Natural Resources Agency will conduct formal rulemaking in 2009, prior to certifying and adopting the amendments, as required by Senate Bill 97.

In the interim, OPR has drafted and released in January 2009 draft amendments to the CEQA Guidelines for GHG emissions as required by SB97. OPR does not identify a threshold of significance for greenhouse gas emissions, nor have they prescribed assessment methodologies or specific mitigation measures. The proposed language was added for clarification and stayed within CEQA's framework. The preliminary draft amendments encourage lead agencies to consider many factors in performing a CEQA analysis, but preserve the discretion granted by CEQA to lead agencies in making their own determinations based on substantial evidence.

General Guidance
Per the OPR, "*until such time as further state guidance is available on thresholds of significance, public agencies should consider the following general factors when analyzing whether a proposed project has the potential to cause a significant climate change impact on the environment*".

Identify GHG Emissions
Lead agencies should make a good-faith effort, based on available information, to calculate, model, or estimate the amount of CO_2 and other GHG emissions from a project, including the emissions associated with vehicular traffic, energy consumption, water usage and construction activities.

Determine Significance
As with any environmental impact, lead agencies must determine what constitutes a significant impact. In the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a "significant impact", individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice. The potential effects of a project may be individually limited but cumulatively significant. Lead agencies should not dismiss a proposed project's direct and/or indirect climate change impacts without careful consideration, supported by substantial evidence. Although climate change is ultimately a cumulative impact, not every individual project that emits GHGs must necessarily be found to contribute to a significant cumulative impact on the environment. CEQA authorizes reliance on previously approved plans and mitigation programs that have adequately analyzed and mitigated GHG emissions to a less than significant level as a means to avoid or substantially reduce the cumulative impact of a project, encourages reliance on other Environmental Impact Reports that discuss greenhouse gases, and tiering from them. The preliminary draft amendments OPR issued included an introduction letter in which OPR indicated that OPR intends to rely on ARB to recommend a method for setting significance thresholds. The draft guidelines add a new section 15064.4 titled "Determining the Significance of GHG Emissions", and it includes a suggestion of situations that might be considered significant.

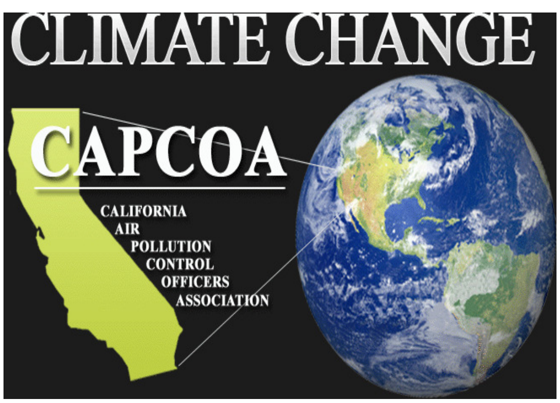
Mitigate Impacts
Mitigation measures will vary with the type of project being contemplated, but may include alternative project designs or locations that conserve energy and water, measures that reduce vehicle miles traveled (VMT) by fossil-fueled vehicles, measures that contribute to established regional or programmatic mitigation strategies, and measures that sequester carbon to offset the emissions from the project. The lead agency must impose all mitigation measures that are necessary to reduce GHG emissions to a less than significant level. However, CEQA does

not require mitigation measures that are infeasible for specific legal, economic, technological, or other reasons, and a lead agency is not responsible for wholly eliminating all GHG emissions from a project; the CEQA standard is to mitigate to a level that is “less than significant”. If there are not sufficient mitigation measures that the lead agency determines are feasible to achieve the less than significant level, the lead agency should adopt those measures that are feasible, and adopt a Statement of Overriding Considerations that explains why further mitigation is not feasible or when an agency makes a statement of overriding considerations, the agency may consider local adverse environmental effects in the context of region-wide or statewide benefits. Agencies are encouraged to develop standard GHG emission reduction or mitigation measures that can be applied on a project-by-project basis.

Land Use Considerations
Local governments with land use authority are beginning to establish policies that result in land use patterns and practices that will result in less energy use and reduce GHG emissions. For example, some cities and counties have adopted general plans and policies that encourage the development of compact, mixed use, transit-oriented development that reduces VMT; encourage alternative fuel vehicle use; conserve energy and water usage; and promote carbon sequestration. Models of such developments exist throughout the state. For local government lead agencies, adoption of general plan policies and certification of general plan EIRs that analyze broad jurisdiction-wide impacts of GHG emissions can be part of an effective strategy for addressing impacts and for streamlining later project-specific CEQA reviews.

3.5 California Air Pollution Control Officers Association (CAPCOA)

CAPCOA – White Paper: CEQA and Climate Change



The intent of CAPCOA’s White Paper is to serve as a resource for public agencies as they establish procedures for reviewing GHG emissions from projects under CEQA. It considers the application of thresholds and offers three alternative programmatic approaches toward determining whether GHG emissions are significant. Although the White Paper considers an option of not establishing a GHG significance threshold, as already noted this option is not considered to be a viable approach and will not be considered further. Ultimately, the White Paper is intended to provide consistent approaches for public agencies to ensure that GHG emissions are appropriately considered and addressed under CEQA (CAPCOA).

The CAPCOA White Paper identifies three programmatic approaches to establishing GHG significance thresholds and also discusses the benefits and problems associated with each approach. Each approach has inherent advantages and disadvantages. The basic approaches are:

- GHG emissions threshold set at zero; or
- GHG threshold set at a non-zero level (AB32 Goals)
- GHG threshold set at a non-zero level (Tiered Approach)

Zero Threshold

An air district or lead agency may determine that any degree of project-related increase in GHG emissions would contribute considerably to climate change which, therefore, would be considered a significant impact. As a result, the air district or lead agency could adopt a zero-emission GHG threshold. If the zero threshold option is chosen, the lead agency would be required to quantify and mitigate GHG emissions for all projects subject to CEQA, regardless of the size of the project or the availability of GHG reduction measures available to reduce the project's emissions. Projects that could not meet the zero-emission threshold would be required to undergo an environmental impact report CEQA process to disclose the unmitigable significant impact, and develop the justification for a statement of overriding consideration to be adopted by the lead agency.

Non-Zero Threshold – Statute and Executive

The first non-zero GHG significance threshold approach is based on achieving the objectives of AB 32 or Executive Order S-3-05 and explores four possible options under this scenario. A project would be required to meet the target objectives, or reduce GHG emissions to the target objectives, to be considered less than significant. The options under this approach are variations of ways to achieve the 2020 goals of AB 32 from new development, which is estimated to be about a 30 percent reduction from business-as-usual. The practical advantages of considering non-zero thresholds for GHG significance determinations can fit into the concept regarding whether the project's GHG emissions represent a "considerable contribution to the cumulative impact" and therefore warrant analysis.

Non-Zero Threshold – Tiered Threshold Options

The second non-zero GHG significance threshold approach is comprised of a number of tiered GHG significance threshold options. Within this option, the CAPCOA White Paper discusses several variations. The tiered threshold options offer both quantitative and qualitative approaches to setting a threshold, as well as different metrics for establishing the various tiers. Variations range from setting the first tier at zero to second tiers set at defined emission levels or based on the size of a project. This approach would then prescribe a set of GHG mitigation strategies that would have to be incorporated into the project in order for the project to be considered less than significant. CAPCOA notes that some applications of the tiered threshold approach may require inclusion in a General Plan or adoption of enabling regulations or ordinances to render them fully effective and enforceable.

CAPCOA offered to ARB on a letter dated January 9, 2009 two possible approaches regarding the issues associated with determining appropriate CEQA significance thresholds for GHG from new residential, commercial and industrial development. One suggested approach is to require all new stationary sources of GHG emissions to meet specific GHG performance standards established for each equipment type of source category of emissions. In addition, any new stationary source exceeding 25,000 tons of CO_2E per year after meeting the specified performance standards would be deemed to have a potentially significant adverse impact on the environment and would be analyzed and mitigated as required under CEQA.

The other suggested approach is that a jurisdiction could establish a CEQA significance threshold for stationary sources designed to capture and mitigate 90% of stationary source emissions. More details on the approaches can be found at: http://www.valleyair.org/Programs/CCAP/1-9-09%20CAPCOA%20Letter%20on%20CEQA%20to%20Lynn%20Terry.pdf.

3.6 Association of Environmental Professionals (AEP)

AEP – White Paper on Global Climate Change

AEP's White Paper was one of the first attempts to discuss GHGs in the context of CEQA. The intent of the White Paper was to provide practical, interim information to CEQA practitioners and to help Lead Agencies determine how to address GHGs and global climate change in CEQA documents prior to the development and adoption of guidance by appropriate government agencies. Further, AEP's White Paper provided a summary of the current regulatory environment surrounding GHG emissions, and the various approaches that a Lead Agency may select in a CEQA document to address the potential impacts of global climate change and a project's specific and cumulative contribution to GHG. The White Paper described several approaches for addressing GHGs and global Climate Change in CEQA documents, but did not recommend a single approach or methodology, leaving that decision to local Lead Agencies. The proposed approaches are summarized in the following bullet points.

Approach 1 – No Analysis: under this approach the Lead Agency would not mention or discuss GHGs or global climate change.

Approach 2 – Screening Analysis: under this approach the Lead Agency would establish a process to screen projects and determine that they would not make significant contributions to GHG emissions or GCC and, therefore, would not need to mitigate accordingly.

Approach 3 – Qualitative Analysis without Significance Determination: this approach involves a qualitative discussion of GHGs and global climate change and potential ways the project will contribute to the generation of GHG emissions, but does not provide any significance conclusions.

Approach 4 – Qualitative Analysis with Significance Determination: under this approach the Lead Agency would qualitatively discuss GHGs and climate change impacts and conclude whether the project impacts are significant.

Approach 5 – Quantitative Analysis without Significance Determination: under this approach the Lead Agency would quantify GHG emissions from the proposed project, but the results are not compared to a quantitative significance threshold.

Approach 6 – Quantitative Analysis with Net Zero Threshold: this approach involves quantifying GHG emissions and using zero net carbon dioxide equivalent increase as the threshold.

Approach 7 – Quantitative Analysis Relative to California GHG Emission Reduction Strategies: this approach employs both quantitative and qualitative components. The quantitative analysis contains an inventory of project GHG emissions. The qualitative component involves project compliance with the emission reduction strategies contained in the California Climate Action Team's (CAT) Report to the Governor, which contains recommendations and strategies to help ensure the targets in Executive Order S-3-05 are met.

Approach 8 – Use of Partial Exemption, "Within the Scope" of a Program EIR, or Tiering: this option relies on the preparation of a broad EIR on a plan, program, or zoning action that is certified and contains a cumulative GHG and global climate change impact analysis and mitigation. A later project that is consistent with the actions, goals, and/or policies in that plan, program, or zoning action need not again evaluate the cumulative impact regarding the project's GHG contribution to global climate change. In this situation, the later project may use the "partial exemption" provision of Public Resources Code §21083.3 and CEQA Guidelines §15183

While some of the approaches discussed above are dated and obsolete (such as those suggesting no analysis, or no determination of significance), the paper remains, in significant part, a valid and useful resource.

3.7 South Coast Air Quality Management District (SCAQMD)

SCAQMD has generally recommended a tiered decision tree approach to establishing a GHG significance threshold (SCAQMD) (See Figure 3). A tiered GHG significance threshold approach is an appealing approach because it provides flexibility in determining whether or not GHG emissions from a project are significant, typically using a single methodology to establish various tiers that can be based on the physical size of the project, land use type, or other characteristics. The tiered approach envisioned by SCAQMD would require quantification of GHG emissions for all projects that are subject to CEQA and quantification of the GHG reduction effectiveness of design parameters incorporated into the project and any mitigation measures imposed by the lead agency.

On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for projects where the SCAQMD is lead agency. SCAQMD recommended the interim GHG significance threshold proposal uses a tiered approach to determining significance. Tier 3, which is expected to be the primary tier by which the AQMD will determine significance for projects where it is the lead agency, uses the Executive Order S-3-05 goal as the basis for deriving the screening level. The Tier 3 screening level for stationary sources is based on an emission capture rate of 90 percent for all new or modified projects. A 90 percent emission capture rate means that 90 percent of total emissions from all new or modified stationary source projects would be subject to a CEQA analysis, including a negative declaration, a mitigated negative declaration, or an environmental impact report, which includes analyzing feasible alternatives and imposing feasible mitigation measures. Once ARB adopts the statewide significance thresholds, SCAQMD staff will report back to their Governing Board regarding any recommended changes or additions to the SCAQMD's interim threshold.

Tier 1 – consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA. For example, SB 97 specifically exempts a limited number of projects until it expires in 2010. If the project qualifies for an exemption, no further action is required. If the project does not qualify for an exemption, then it would move to the next tier.

Tier 2 – consists of determining whether or not the project is consistent with a GHG reduction plan that may be part of a local general plan, for example. The concept embodied in this tier is equivalent to the existing concept of consistency in CEQA Guidelines §§15064(h)(3), 15125(d), or 15152(a). The GHG reduction plan must, at a minimum, comply with AB 32 GHG reduction goals; include emissions estimates agreed upon by either ARB or the SCAQMD, have been analyzed under CEQA, and have a certified Final CEQA document. Further, the GHG reduction plan must include a GHG emissions inventory tracking mechanism; process to monitor progress in achieving GHG emission reduction targets, and a commitment to remedy the excess emissions if AB 32 goals are not met (enforcement).

If the proposed project is consistent with the local GHG reduction plan, it is not significant for GHG emissions. If the project is not consistent with a local GHG reduction plan or there is no approved plan, the GHG reduction does not include all of the components described above, or there is no adopted GHG reduction plan, the project would move to tier 3.

Tier 3 – Establishes a screening significance threshold level to determine significance using a 90 percent emission capture rate approach as described above. The 90 percent capture rate GHG significance screening level in Tier 3 for stationary sources was derived using the following methodology. Using SCAQMD's Annual Emission Reporting (AER) Program staff compiled reported annual natural gas consumption for 1,297 permitted facilities for 2006 through 2007 and rank-ordered the facilities to estimate the 90th percentile of the cumulative natural gas usage for all permitted facilities. Approximately 10 percent of facilities evaluated comprise more than 90 percent of the total natural gas consumption, which corresponds to 10,000 metric tons of CO_2 equivalent emissions per year ($MTCOCO_2E$/yr) (the majority of combustions emissions is comprised of CO_2). This value represents a boiler with a rating of approximately 27 million British thermal units per hour (mmBtu/hour) of heat input, operating at a 80 percent capacity factor. It should be noted that this analysis did not include other possible GHG pollutants such as methane, N2O; a life-cycle analysis; mobile sources; or indirect electricity consumption. Therefore, when implemented, SCAQMD staff recommended interim proposal is expected to capture more than 90 percent of GHG emissions from stationary source projects. If the project exceeds the GHG screening significance threshold level and GHG emissions cannot be mitigated to less than the screening level, the project would move to Tier 4.

Tier 4 – Decision Tree Options: consists of three decision tree options to demonstrate that a project is not significant for GHG emissions. The compliance options are as follows:

Compliance Option 1 – the lead agency would calculate GHG emissions for a project using a Business As Usual (BAU) methodology. Once GHG emissions are calculated, the project proponent would need to incorporate design features into the project and/or implement GHG mitigation measures to demonstrate a 30 percent reduction from BAU.

Compliance Option 2 – this option consists of early compliance with AB 32 through early implementation of ARB's Scoping Plan Measures. The intent of this compliance option is to accelerate GHG emission reductions from the various sectors subject to ARB's Scoping Plan to eliminate GHG emission.

Compliance Option 3 – this compliance option consists of establishing sector-based performance standards. For example, it may be possible to use the 1990 inventory required under AB 32 to establish an efficiency standard such as pounds per person, pounds per worker, pounds per square feet, pounds per item manufactured, etc. When calculating GHG emissions from a project, if they are less than the established efficiency standard the project would not be significant relative to GHG emissions, while projects exceeding the efficiency standard would be significant.

If the project proponent cannot achieve the performance standards on any of the compliance options in Tier 4, GHG emissions would be evaluated under Tier 5.

Tier 5 – under this tier, the lead agency would quantify GHG emissions from the project and the project proponent would implement offsite mitigation (GHG reduction projects) or purchase offsets to reduce GHG emission impacts to less than the proposed screening level. In addition, the project proponent would be required to provide offsets for the life of the project, which is defined as 30 years. If the project proponent is unable to obtain sufficient offsets, incorporate design features, or implement GHG reduction mitigation measures to reduce GHG emission impacts to less than the screening level, then GHG emissions from the project would be considered significant.

3.8 Bay Area Air Quality Management District (BAAQMD)

On June 1, 2005 the Bay Area Air District Board of Directors adopted a resolution establishing a Climate Protection Program and acknowledging the link between climate protection and programs to reduce air pollution in the Bay Area. The Board of Directors also formed a standing Committee on climate protection to provide direction on District climate protection activities (BAAQMD). In April 2009, Bay Area AQMD prepared a draft report that evaluates options for California Environmental Quality Act (CEQA) thresholds of significance for use within BAAQMD's jurisdiction.

3.9 Sacramento Metropolitan Air Quality Management District (SMAQMD)

The Sacramento Metropolitan AQMD recommends that CEQA environmental documents include a discussion of anticipated GHG emissions during both the construction and operation phases of the project (SMAQMD). This recommendation is consistent with comments made by the previous and current California Attorney Generals on Land Use projects undergoing CEQA review. The Sacramento Metropolitan AQMD indicates that models are available to quantify GHG emissions from projects. In addition, the Sacramento Metropolitan AQMD offers several examples of type of mitigations that local agencies may consider under CEQA to offset or reduce global warming impacts, and is currently developing a pilot project in which a development project proponent will be contributing fees to the District which will then use those funds in GHG mitigation projects.

3.10 San Joaquin Valley Air Pollution Control District CCAP Committees

As mentioned earlier, three ad hoc committees were created to assist in the guidance development for addressing GHG emissions during the CEQA process. They are (1) the Project Scope Committee, (2) the Level of Significance Committee, and the (3) Mitigation Measure Committee. The committee members included people with industrial, government, consulting, and environmental backgrounds and perspectives. Member lists are found in Appendixes A, B, and C. The committees developed a Guidance Issue Paper first and three progress reports subsequently, each focusing on a specific topic. The Guidance Issue Paper was used primarily to provide a starting point. The expanded discussion by the committees was conveyed in the progress reports and is incorporated here in the Appendixes D-G.

These issue papers do not necessarily represent the position or intention of the San Joaquin Valley Air District Pollution Control District, but are presented with this staff report to represent the input of the committee members themselves. Their assistance in the early stages of scoping and proposing various methods of addressing GHG emissions in CEQA was essential and appreciated.

CHAPTER 4

DISTRICT GHG SIGNIFICANCE DETERMINATION PROPOSAL

4.1 Background

The obligation for public agencies to address the potential environmental effects of greenhouse gas (GHG) emissions arises from the California Environmental Quality Act (CEQA), which requires agencies to identify a project's potentially significant effects on the environment, and to mitigate significant effects whenever feasible. CEQA encourages public agencies to adopt "thresholds of significance" to use in determining the significance of environmental effects. A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect. Non-compliance with a threshold of significance would normally result in a determination that the project would have a significant environmental impact. Compliance with a significance threshold would normally result in a determination that project would not have a significant environmental impact.

Including evaluation of project related GHG emissions in CEQA evaluations is part of a rapid evolution of California State Climate policy, formalized, in part, with passage of Assembly Bill 32 (California Global Warming Solutions Act of 2006) (AB 32), Senate Bill 97 (CEQA: greenhouse gas emissions) (SB 97), and Senate Bill 375 (SB 375), commonly referred to in the popular press as the "climate change smart growth bill". Development of significance threshold for GHG emissions must be done in the context of these key legislative mandates.

AB 32 establishes the GHG emission reduction targets to be achieved by the State of California, and provides the framework for achieving those required reductions. AB 32 includes a number of specific requirements to be implemented by the California Air Resources Board (ARB), including preparation of a scoping plan for achieving the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions from sources or categories of sources of greenhouse gases by 2020.

SB 375 enhances ARB's ability to reach AB 32 goals by directing ARB to develop regional greenhouse gas emission reduction targets to be achieved from the automobile and light truck sectors for 2020 and 2035. SB 375 also directs ARB to work with California's 18 metropolitan planning organizations to align their regional transportation, housing and land-use plans and prepare a "sustainable communities strategy" to reduce the amount of vehicle miles traveled in their respective regions and demonstrate the region's ability to attain its greenhouse gas reduction targets. A key component of SB 375 is that ARB is required to establish GHG emission reduction targets for each region, as opposed to individual cities or households.

SB 97 requires the Governor's Office of Planning and Research (OPR) to develop CEQA guidelines for addressing GHG emissions. On April 13, 2009, OPR submitted to the Secretary for Natural Resources its proposed amendments to the state CEQA Guidelines for greenhouse gas emissions, as required by Senate Bill 97. These proposed CEQA Guideline amendments would provide guidance to public agencies regarding the analysis and mitigation of the effects of greenhouse gas emissions in draft CEQA documents.

A key aspect of the proposed OPR guidance is that a lead agency shall have the discretion to determine, in the context of a particular project, whether to:

- Use a model of methodology to quantify GHG emissions, or
- Rely on a qualitative analysis or performance based standards

Furthermore, when assessing the significance of impacts from GHG emissions the lead agency may consider the following:

- The extent to which a project may increase or reduce GHG emissions as compared to the existing environmental setting;
- Whether project emissions exceeds a threshold of significance;
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for reduction or mitigation of GHG emissions.

4.2 The Challenge of Assessing Significance

The challenge in assessing the significance of individual project GHG emissions is to determine whether project specific GHG emissions, which are at a micro-scale relative to global emissions, would result in a cumulatively considerable incremental contribution to global climatic change, which is macro-scale impact. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. Furthermore, the mere existence of significant cumulative impacts caused by other projects does not constitute substantial evidence that a proposed project's incremental effects are cumulatively significant.

As presented in this staff report, the District has actively sought the input, advice, and assistance of numerous interested parties and stakeholder groups. Through the Climate Change Action Plan scoping meetings, the District explored numerous approaches for establishing significance thresholds for project specific GHG emissions. Furthermore, the District has closely monitored actions taken by ARB and OPR to comply with their legislative mandates and the District continues to actively participate in CAPCOA's GHG Threshold and Mitigation subcommittee. The following discusses the various options considered by the District in establishing its proposed guidance for determining the significance of project specific GHG emissions.

Zero Threshold
The District has given due consideration to the complexity of evaluating the significance of project specific GHG emissions and. Some members of the District's Climate Change Action Plan committee recommended that if project specific impacts can not be quantified, then to be most protective of the environment, the District should apply a zero threshold of significance. In applying a zero threshold of significance, all projects subject to CEQA, with new GHG emissions would have to be found to have a significant impact on global climatic change. Such a determination would require all feasible mitigation, with the goal of mitigating to a net zero emissions level.

Although a zero threshold is appealing in its simplicity; execution of a zero threshold would be difficult or impossible. Projects that could not be mitigated to zero would require preparation of an EIR and in approving such projects, lead agencies would be required to adopt a statement of overriding consideration. This would result in an enormous regulatory burden on new projects and lead agencies across the District, with potentially very little positive gain in terms of GHG emissions mitigation. Furthermore, cost increases associated with compliance would likely result in projects being relocated to areas not subject to similar emission reduction requirements. Such "leakage" would not result in reduced GHG emissions and would serve to create a competitive disadvantage for businesses located within the District. ARB has concluded that zero thresholds are not mandated because some level of emissions in the near term and at mid-century is still consistent with climate stabilization and current and anticipated regulations and programs apart from CEQA will proliferate and increasingly will reduce GHG contributions[7]. ARB does not support a zero threshold, nor does the District.

Quantitative Thresholds

ARB, as well as other air districts within the state, has been considering quantitative thresholds. Several options exist for establishing quantitative thresholds, including mass of GHG emissions generated per unit of activity, GHG emissions per capita per unit basis, and percent reduction compared to business as usual. In evaluating this concept for stationary source projects (industrial and agricultural equipment and operations requiring air quality permits), the District used its database of permitted sources and its emissions inventory data to establish baseline GHG emissions data for key sources of GHG emissions. For development projects, the District used its Indirect Source Review database of development projects to baseline GHG emissions for both residential and non-residential development projects.

Using the data discussed above, the District explored a four tiered significance determination concept for use with both stationary source projects and development projects. Projects exempt from CEQA would be in tier one, and not be subject to further analysis, or GHG mitigation requirements. Tier two would contain projects considered too small to warrant further consideration (arbitrarily 10 percent of projects subject to CEQA). Such projects would not require quantification of GHG emissions, and would not require GHG mitigation. Tier three would contain projects with emissions greater than the minimum threshold, but below a maximum threshold. The maximum threshold would be set low enough to capture enough projects to offset the emissions not captured in tier two. Tier three projects would not require quantification of GHG emissions, would be required to reduce GHG emissions consistent with AB 32 targets, and would be considered less than significant. Tier four would contain projects above the maximum threshold. Tier four projects would require quantification of GHG emissions, and would be required to reduce their GHG emissions in excess to AB 32 emission reduction targets.

---

[7] California Air Resources Board, Preliminary Draft Staff Proposal, Recommended Approaches for Setting Interim Significance Thresholds for Greenhouse Gases Under the California Environmental Quality Act. October 24, 2008.

Using existing databases, the District was able to establish baseline emissions for stationary source projects and development projects, and was able to establish mass GHG emissions per unit of activity. However, without supporting scientific information, establishment of tier trigger levels could be argued to be arbitrary. Furthermore, it is unclear that CEQA provides a legal basis for requiring proponents of large projects to mitigate their project impacts to the extent necessary to compensate for emissions not reduced by smaller projects.

Best Performance Standards

The existing science is inadequate to support quantification of the impacts that project specific GHG emissions have on global climatic change. No one has been able to scientifically demonstrate that a project of any size is significant, or insignificant. This is readily understood when one considers that global climatic change is the result of the sum total of GHG emissions, both man made and natural that occurred in the past; that is occurring now; and will occur in the future. Thus, there is growing scientific consensus that impacts of a specific project's emissions on global climatic change are cumulative in nature, and the significance thereof can only be examined in that context.

The State legislature, in enacting AB 32 and SB 375, and the Governor's Office of Planning and Research (OPR) in their CEQA guidelines for addressing GHG emissions (see page 46), provided the foundation for establishing performance based determinations of significance of GHG emissions. In enacting this landmark legislation the State considered the cumulative significance of GHG emissions and established aggressive GHG emission reduction targets for key sources of GHG emissions in the state of California. ARB in carrying out its AB 32 mandates has determined that the emission reductions targets established per AB 32 can be accomplished by achieving a 29% reduction in GHG emissions from business as usual (BAU), from key GHG emission source categories (see Figure 2). Thus establishing what could be considered a de facto standard for GHG emission reductions to be achieved at the project level for GHG emission source categories.

PESC Winter 2008 Summit - REGISTER NOW!

PESC is pleased to announce that the Winter 2008 Summit will be held Thursday January 17 - Friday January 18, 2008 at the Hyatt Regency Washington on Capitol Hill. Online registration for the PESC Winter 2008 Summit is available online at www.PESC.org. Hotel reservations can be made by contacting the hotel directly at (202) 737-1234 or 1-800-233-1234. Please use the group name "PESC" to ensure you receive the discounted hotel rate of $199.00. The hotel cut-off date is Friday January 4, 2008. Thanks to our generous sponsor, Regent Education, PESC offers workgroup summits FREE of charge to all parties interested in participating. While there is no fee, space is limited and registration is required for this event. Workgroup summits, held during the fall and winter of each year, are the perfect opportunity to gather face-to-face with fellow workgroup members to collaborate on PESC initiatives, to cultivate relationships with other members, and to be updated on all PESC activities. Please keep in mind that summits are working meetings, so many of the workgroups currently active will congregate to discuss and progress on their respective standards development efforts.

Our tentative meeting schedule which includes meetings of various workgroups and boards of the Standards Forum for Education, meetings of the Steering Committee, Board of Directors and includes AACRAO's SPEEDE Committee, is on page 6.

Note that continental breakfast and registration open at 7:30am in the conference foyer on Thursday January 17, 2008. The Winter 2008 Summit kicks off from 8:30am - 5:00pm with concurrent meetings being held all day. Lunch on both days is on your own. A general session takes place from 3:30pm - 5:00pm and includes updates from PESC, the Board of Directors the Steering Committee, and all of the Workgroups and boards that met on the previous day.

See Summit, Page 2

Special Member Meeting - Thursday January 17, 2008

Please be advised that a special meeting of the PESC Membership is being called for Thursday January 17, 2008 at 5:15pm. The meeting will be held at the Hyatt Regency on Capitol Hill during the PESC Winter 2008 Summit. The purpose of the meeting is for the Board to present a revised dues schedule to the members of PESC and hold a vote as changes in dues must be approved by a majority vote of the members. The proposed changes for the next 5 years are included on page 7.

The basis for the use of performance based standards is well founded both legislatively and in implementation of legislative mandates. As presented before, SB 97 and SB 375 clearly provide for establishing either quantitative or qualitative based determinations of significance. ARB, in implementing their legislative mandate to develop guidance for assessing significance of project related GHG emissions, prepared a preliminary draft proposal that defines threshold of significance as "an identifiable quantitative, qualitative or performance level that marks the division between an impact that is significant and one that is not". In April 2009, the Governor's Office of Planning and Research (OPR) proposed several amendments to the CEQA Guidelines to address analysis and mitigation of potential effects of greenhouse gas emissions. Among the proposed amendments are provisions recognizing lead agency discretion to adopt quantitative or qualitative thresholds of significance. Specific amendments are presented below.

OPR proposed a new subdivision that emphasizes that the effects of greenhouse gas emissions are cumulative, and should be analyzed in the context of CEQA's requirements for cumulative impacts analysis. (See section 15130(f)). OPR further proposed a new subdivision to assist lead agencies in determining the significance of project related greenhouse gas emissions. (See section 15064.4.). In addition to quantification of GHG emissions, this section provides for the consideration of several other qualitative factors that may be used in the determination of significance. Per the proposed amendments, a lead agency has discretion to determine whether to:

- Use a model or methodology to quantify greenhouse gas emissions resulting from a project, or
- To rely on a qualitative analysis, or
- To apply performance based standards.

Under OPR's proposed guidance a lead agency may consider the following when assessing the significance of impacts from greenhouse gas emissions on the environment:

- The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting; or
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project, or
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions.

A new subdivision was added to assist lead agencies in determining methods to mitigate the effects of greenhouse gas emissions. (See section 15126.4(c)). To emphasize the advantages of programmatic planning this new subdivision emphasizes compliance with a plan among the list of potential mitigation measures. However, to qualify as mitigation, specific measures from an existing plan must be identified and incorporated into the project; general compliance with a plan, by itself, is not mitigation. Finally, this subdivision reiterates that mitigation for planning level decisions may include the development of specific measures to be implemented on a project-by-project basis.

The District favors use of performance based standards, but recognizes that performance standards have not been developed for all sources of GHG emissions. Thus, for sources not covered by ARB's scoping plan or SB 375, the District will need to invest resources and work with stakeholders, ARB, planning agencies, and other interested parties to establish source specific performance standards. This process is expected to be ongoing, as mitigation measures and techniques will evolve and improve over time, as will our understanding of those measures.

4.3.2 Determining Significance

4.3.2.1 Introduction

CEQA requires lead agencies to establish specific procedures for administering its responsibilities under CEQA, including orderly evaluation of projects and preparation of environmental documents. Each lead agency is encouraged to develop and publish thresholds of significance for use in determining the significance of environmental effects.

Determining the significance of project specific impacts of GHG emissions on global climate change is a relatively new concept, and, in the absence of uniform guidance from the state, lead agencies throughout California are facing difficulties to develop their own policies and procedures for implementing GHG CEQA requirements. The District is viewed by many in the San Joaquin Valley as the leading authority on air pollution concerns, including GHG issues, and so several lead agencies have asked the District to provide such guidance. Therefore, the District is developing guidance for its own internal use when serving as the lead agency, and is also proposing guidance to assist other agencies in establishing their own processes for determining significance of project related impacts on global climate change. The methodology being proposed relies on the use of performance based standards to assess the significance of project specific GHG emissions, and would be applicable to projects that result in increased GHG emissions. Nothing in this guidance shall be construed as limiting a lead agency's authority to adopt a statement of overriding consideration for projects with significant GHG impact.

The effects of project specific GHG emissions are cumulative, and without mitigation their incremental contribution to global climatic change could be considered cumulatively significant. The District believes that this is best addressed by requiring all projects (not just those with GHG emissions above some arbitrary "significance threshold") to reduce their GHG emissions, whether through project design elements, or mitigation. Projects achieving performance based standards that have been demonstrated to be "Best Performance Standards" would be considered to have a less than cumulative significant impact on global climate change.

Use of BPS would streamline the significance determination process by pre-quantifying the emission reductions that would be achieved by a specific GHG emission reduction measure and pre-approving the use of such a measure to mitigate project-related GHG emissions. Establishing BPS would also streamline the CEQA review process by providing project proponents, lead agencies and the public with clear guidance on how to mitigate GHG emission impacts. Thus, project proponents would be able to incorporate project specific GHG reduction measures during the initial project design phase, which could reduce or mitigate project specific GHG impacts to less than significant levels.

As presented in Chapter 5, to support a determination of significance, the efficiency of GHG emission reduction measures would be quantified at the time Best Performance Standards are established for a specific project type or source category. As shown in Appendix L, implementing BPS for stationary sources is expected to achieve an overall 34.0% reduction in GHG emissions, exceeding the overall 29% GHG emission reduction targeted by ARB in the scoping plan.

4.3.2.2 Definitions

The following definitions are provided to assist the reader in understanding the vernacular associated with the proposed approach of determining significance of project specific impacts on global climate change.

Achieved-in-Practice
Achieved-in-Practice is – Any equipment, technology, practice or operation available in the United States that has been installed and operated or used at a commercial or stationary source site for a reasonable period of time sufficient to demonstrate that the equipment, technology, practice or operation is reliable when operated in a manner that is typical for the process. In determining whether equipment, technology, practice or operation is Achieved-in-Practice, the District will consider the extent to which grants, incentives or other financial subsidies influence the economic feasibility of its use.

Approved Alternate Technology
Approved Alternate Technology is – Any District approved, Non-Achieved-in-Practice GHG emissions reduction measure equal to or exceeding the GHG emission reduction percentage for a specific BPS

Baseline
For Stationary Source projects, Baseline is – the three year average (2002-2004) of GHG emissions for a type of equipment or operation within an identified class and category, expressed as annual GHG emissions per unit.

For Residential Development projects, Baseline is – the three year average of GHG emissions from all dwelling units in the San Joaquin Valley Air District, during the 2002 through 2004 baseline period, expressed as annual GHG emissions per unit.

For Commercial and Industrial Development projects, Baseline is – the three year average of GHG emissions from all commercial or industrial units in the San Joaquin Valley Air District, during the 2002 through 2004 baseline period, expressed as annual GHG emissions per commercial or industrial unit.

Best Performance Standard
For Stationary Source Projects for which the District must issue permits, Best Performance Standard is – For a specific Class and Category, the most effective, District approved, Achieved-In-Practice means of

reducing or limiting GHG emissions from a GHG emissions source, that is also economically feasible per the definition of achieved-in-practice. BPS includes equipment type, equipment design, and operational and maintenance practices for the identified service, operation, or emissions unit class and category.

For Development Projects (Residential, Commercial or Industrial), Best Performance Standard is – Any combination of District approved, Achieved-In-Practice emission reduction measures reducing or limiting GHG emissions by in at least a 29% compared to BAU. GHG emission reduction measures include building standards, appliance standards, project design elements, and land use decisions.

Business-as-Usual
For Stationary Source Projects, Business-as-Usual is - the emissions for a type of equipment or operation within an identified class and category projected for the year 2020, assuming no change in GHG emissions per unit of activity as established for the baseline period.

For Development Projects (Residential, Commercial or Industrial), Business-as-Usual is – total baseline emissions for all emissions sources within the development type, projected for the year 2020, assuming no change in GHG emissions per unit of activity as established for the baseline period.

Category
For stationary source permitting projects, Category is – A District approved subdivision within a “class” as identified by unique operational or technical aspects.

Class
For stationary source permitting projects, Class is - The broadest District approved division of stationary GHG sources based on fundamental type of equipment or industrial classification of the source operation.

4.3.2.3 Establishing Business-as-Usual and Baseline

In executing its legislative mandate to establish emission reduction targets which would achieve the 1990 GHG emission levels by the year 2020, the California Air Resources Board (CARB) used its emission inventory to establish a three-year average for GHG emissions occurring by sector during the baseline period of 2002-2004. As presented in Figure 4, Baseline Period GHG emissions exceed 1990 emission levels by almost 10 percent. Baseline Period GHG emissions include emissions from all sources in ARB's emissions inventory, including both, old and new, large and small GHG emission sources.

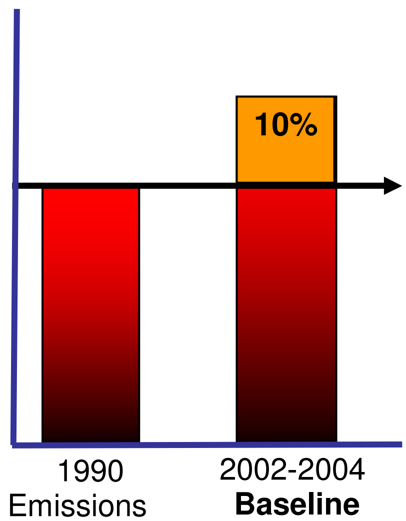
The Baseline Period emissions were then projected to the year 2020, using assumptions about potential growth, assuming no change in the existing business practices, and without considering implementation of any GHG emission reduction measures. CARB designated the baseline emissions inventory projected to the year 2020 as business-as-usual (BAU). As presented in Figure 5, CARB determined that a 29% GHG emissions reduction from BAU is necessary to achieve the 1990 GHG emissions level.

BAU, as established by CARB, is a projected emissions inventory and does not represent actual business or operational practices generating GHG emissions. Therefore, to relate BAU to an emissions generating activity, the District proposes to establish emission factors per unit of activity, for each class and category, using the 2002-2004 baseline period as the reference. For example, for a combustion process, an emissions factor could be expressed as pounds of GHG emissions generated per cubic feet of gas consumed, or pounds of GHG emissions generated per unit of production. For a residential development project an emissions factor could be expressed as annual pounds of GHG emissions generated per dwelling unit.

Thus, by comparing emissions per unit of activity, one can determine the extent to which GHG emissions from a specific source have changed compared to BAU. GHG emission reductions would be determined by establishing a GHG emissions factor per unit of activity for the proposed project and comparing it to the emissions factor established for the 2002-2004 baseline period. Projects implementing BPS, or otherwise demonstrating that GHG emissions have been reduced by 29% will be determined to have a less than significant individual and cumulative impact on global climate change. The percent reduction in GHG emissions would be calculated using the following methodology:

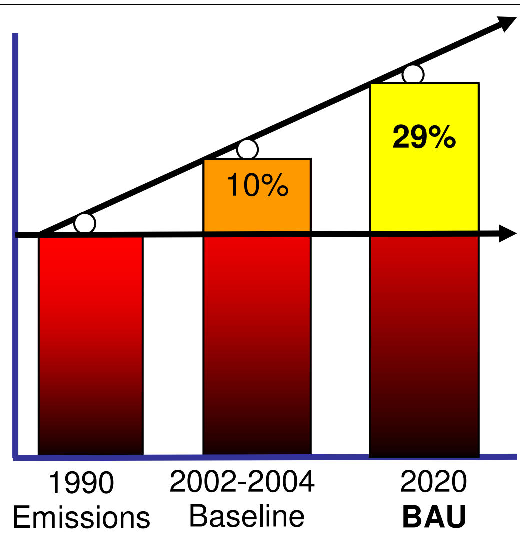
$$\%\ \text{Reduction in GHG emissions} = \frac{(\text{2002 - 2004 baseline GHG emission factor}) - (\text{Proposed project GHG emissions factor})}{\text{2002} - \text{2004 baseline GHG emission factor}}\ x100\%$$

Figure 4: 2002-2004 Baseline Period



- Baseline is a 3-year average GHG emission inventory for the 2002-2004 period
- Baseline includes emissions from all sources in existence at that time; old & new, small & large
- With no growth, the 1990 GHG target could be achieved by a 10% reduction

Figure 5: 2020 Business-as-Usual (BAU)



- BAU is a projection of the baseline emissions inventory reflecting anticipated growth to the year 2020
- ARB's 29% GHG emission reduction target is from BAU
- Projects occurring after the Baseline period may already have achieved GHG emission reductions

4.3.2.4 Determining Project Significance

The District will establish Best Performance Standards (BPS) for stationary sources permitted by the District and will propose GHG emission reduction measures to achieve BPS for development projects. BPS is intended to achieve the maximum GHG emission reductions from a stationary source project and achieve a cumulative total of at least 29% reduction in GHG emissions from development projects, compared to BAU.

In evaluating GHG emissions from a specific project the District recommends that a lead agency characterize both direct and indirect GHG emissions. Direct GHG emissions would include emissions resulting from a specific operation or process, e.g. fuel combustion emissions from a boiler. Indirect GHG emissions would include emissions resulting from project related energy consumption, e.g. electricity consumed by the production and electricity required to produce and transport water used by the project. For projects resulting in increased vehicle miles traveled (VMT), indirect GHG emissions associated with transportation related activities would also be included in the GHG emissions quantification.

Projects exempt from the requirements of CEQA would not require further analysis, including analysis of project specific GHG emissions. Projects complying with an approved GHG emission reduction plan or GHG mitigation program, which avoids or substantially reduces GHG emissions within the geographic area in which the project is located would be determined to have a less than significant individual and cumulative impact for GHG emissions. Such plans or programs must be specified in law or approved by the lead agency with jurisdiction over the affected resource and supported by a CEQA compliant environmental review document adopted by the lead agency.

Projects requiring project specific environmental review would be evaluated according to a Best Performance Standards (BPS) approach. Projects complying with the GHG emission reduction requirements established as Best Performance Standards would not require project specific quantification of GHG emissions and would be determined to have a less than significant individual and cumulative impact for GHG emissions.

Projects not complying with GHG emission reduction requirements established as Best Performance Standards would require quantification of project specific GHG emissions. To be determined to have a less than significant individual and cumulative impact on global climate change, project specific GHG emissions have to be reduced or mitigated by 29% from Business-as-Usual GHG emissions.

Projects requiring preparation of an Environmental Impact Report would require quantification of project specific GHG emissions. Projects implementing BPS or achieving at least a 29% GHG emission reduction compared to BAU would be determined to have a less than significant individual and cumulative impact for GHG.

4.3.2.5 Determining Significance for Stationary Source Projects

Introduction

CEQA requires lead agencies to establish specific procedures for administering its responsibilities under CEQA, including orderly evaluation of projects and preparation of environmental documents. Each lead agency is encouraged to develop and publish thresholds of significance for use in determining the significance of environmental effects. The San Joaquin Valley Air Pollution Control District proposes the following process for determining the individual and cumulative significance of project specific GHG emissions on global climate change when issuing permits for stationary source projects: However, nothing in this guidance shall be construed as limiting a lead agency's authority to adopt a statement of overriding consideration for projects with significant GHG impact.

District Process for Evaluating GHG Significance

- Projects determined to be exempt from the requirements of CEQA would be determined to have a less than significant individual and cumulative impact for GHG emissions and would not require further environmental review, including analysis of project specific GHG emissions. Projects exempt under CEQA would be evaluated consistent with established rules and regulations governing project approval and would not be required to implement BPS.

- Projects complying with an approved GHG emission reduction plan or GHG mitigation program which avoids or substantially reduces GHG emissions within the geographic area in which the project is located would be determined to have a less than significant individual and cumulative impact for GHG emissions. Such plans or programs must be specified in law or approved by the lead agency with jurisdiction over the affected resource and supported by a CEQA compliant environmental review document adopted by the lead agency. Projects complying with an approved GHG emission reduction plan or GHG mitigation program would not be required to implement BPS.

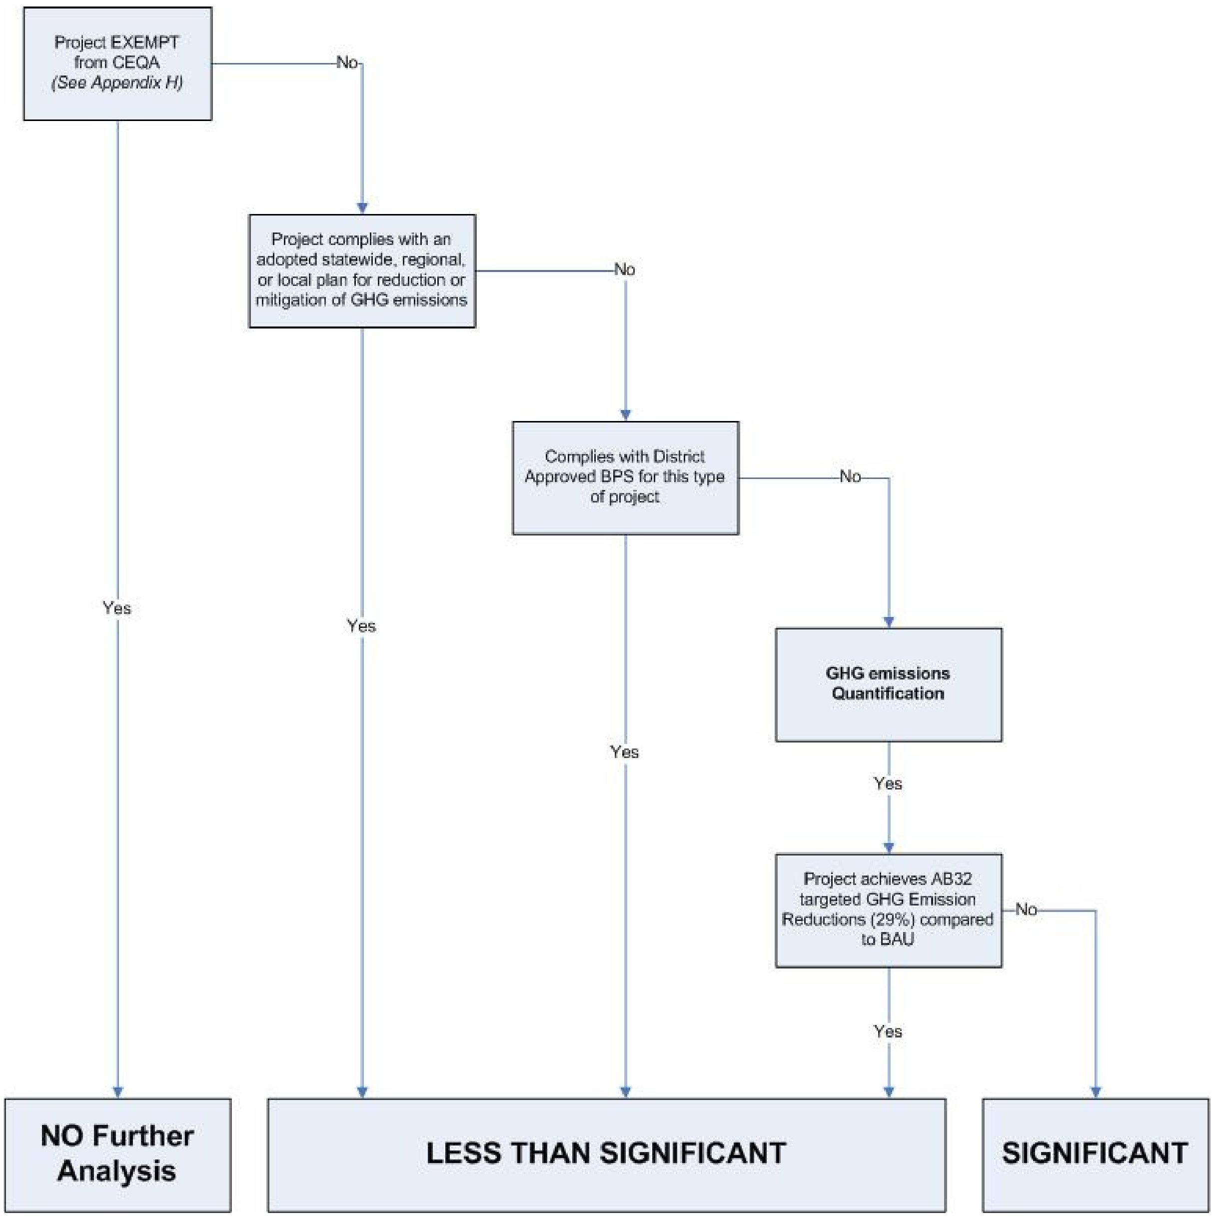
- Projects implementing Best Performance Standards would not require quantification of project specific GHG emissions. Consistent with CEQA Guideline, such projects would be determined to have a less than significant individual and cumulative impact for GHG emissions.

- Projects not implementing Best Performance Standards would require quantification of project specific GHG emissions and demonstration that project specific GHG emissions would be reduced or mitigated by at least 29%, compared to BAU, including GHG emission reductions achieved since the 2002-2004 baseline period. Projects achieving at least a 29% GHG emission reduction compared to BAU would be determined to have a less than significant individual and cumulative impact for GHG.

- Projects requiring preparation of an Environmental Impact Report would require quantification of project specific GHG emissions. Projects implementing BPS or achieving at least a 29% GHG emission reduction compared to BAU would be determined to have a less than significant individual and cumulative impact for GHG.

Figure 6 illustrates implementation of this guidance for permitted sources.

Figure 6: Stationary Source Projects with GHG Emissions



4.3.2.6 Determining Significance for Development Projects

Introduction

Determining the significance of project specific impacts of GHG emissions on global climate change is relatively new and lead agencies are finding themselves challenged to develop their own guidance. Many land use agencies have expressed serious concerns about the lack of guidance, and some have asked the District for their assistance in finding an adequate approach to address these new CEQA requirements. Therefore, the District is proposing the following guidance to assist lead agencies in establishing their own processes for determining significance of project related impacts on global climate change. Nothing in this guidance shall be construed as limiting a lead agency's authority to adopt a statement of overriding consideration for projects with significant GHG impact.

Proposed Land Use Agency Process for Evaluating GHG Significance

- Projects determined to be exempt from the requirements of CEQA would be determined to have a less than significant individual and cumulative impact for GHG emissions and would not require further environmental review, including analysis of project specific GHG emissions. Projects exempt under CEQA would be evaluated consistent with lead agency rules and regulations governing project approval and would not be required to implement BPS.

- Projects complying with an approved GHG emission reduction plan or GHG mitigation program, which avoids or substantially reduces GHG emissions within the geographic area in which the project is located would be determined to have a less than significant individual and cumulative impact for GHG emissions. Such plans or programs must be specified in law or approved by the lead agency with jurisdiction over the affected resource and supported by a CEQA compliant environmental review document adopted by the lead agency. Projects complying with an approved GHG emission reduction plan or GHG mitigation program would not be required to implement BPS.

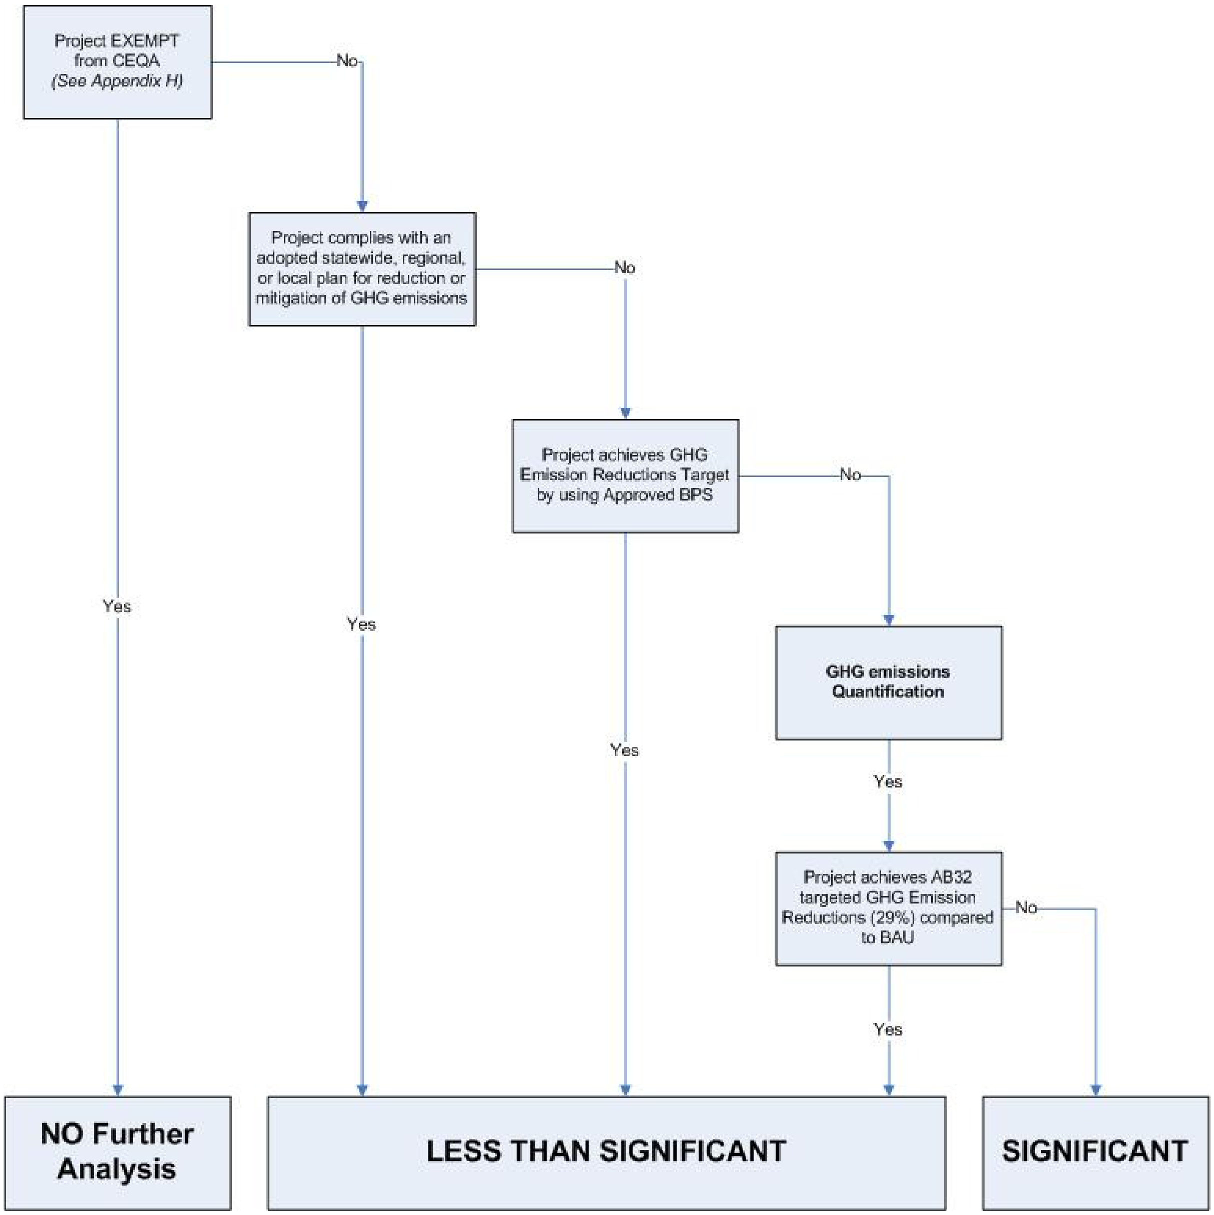
- Projects implementing BPS, reducing project specific GHG emissions by at least 29% compared to BAU, would be determined to have a less than significant individual and cumulative impact on global climate change. Reductions in project specific GHG emissions would include GHG emission reductions achieved since the 2002-2004 baseline period. Projects determined to have a less than significant individual and cumulative impact for GHG emissions would not require quantification of project specific GHG emissions.

- Projects not implementing BPS, to achieve at least a 29% reduction in GHG emissions as compared to BAU, would require quantification of project specific GHG emissions. Projects demonstrated to have reduced or mitigated project specific GHG emissions by at least 29% compared to BAU would be determined to have a less than significant individual and cumulative impact on global climate change.

- Projects requiring preparation of an Environmental Impact Report would require quantification of project specific GHG emissions. Projects implementing BPS or achieving at least a 29% GHG emission reduction compared to BAU would be determined to have a less than significant individual and cumulative impact for GHG.

Figure 7 illustrates implementation for development projects.

Figure 7: Development Projects with GHG Emissions



CHAPTER 5

DISTRICT BEST PERFORMANCE STANDARDS

5.1 Best Performance Standards - Principles

The District will establish Best Performance Standards (BPS) for stationary sources permitted by the District and will propose GHG emission reduction measures to achieve BPS for development projects for use by land use agencies in the San Joaquin Valley. BPS is intended to achieve feasible GHG emission reductions from the stationary source project and achieve a combined total of 29% reduction in GHG emissions from development projects.

Use of BPS would streamline the significance determination process by pre-quantifying the emission reductions that would be achieved by a specific GHG emission reduction measure and pre-approving the use of such a measure to mitigate project-related GHG emissions. Establishing BPS would also streamline the CEQA review process by providing project proponents, lead agencies and the public with clear guidance on how to mitigate GHG emission impacts. Thus, project proponents would be able to incorporate project specific GHG reduction measures during the initial planning phase, which could reduce or mitigate project specific GHG impacts to less than significant levels.

BPS would be established through a process approved by the District's Governing Board. As defined, BPS is the most effective, achieved-in-practice, means of reducing or limiting GHG emissions from a GHG emissions source. For traditional stationary source projects, BPS includes equipment type, equipment design, and operational and maintenance practices for the identified service, operation, or emissions unit class and category. For development projects, BPS includes project design elements, land use decisions, and technologies that reduce GHG emissions.

Establishing BPS would help project proponents, lead agencies, and the public by proactively identifying effective, feasible mitigation measures. Emission reductions achieved through implementation of BPS would be pre-quantified thus, negating the need for project specific quantification of GHG emissions. The use of BPS provides opportunity to streamline the process of determining the individual and cumulative significance of project specific GHG impacts on global climate change, conserving resources and reducing regulatory burdens.

5.2 Establishing Best Performance Standards

5.2.1 Introduction

Through implementing stationary source permitting processes and District Rule 9510 (Indirect Source Review), District staff has considerable experience in evaluating emissions control technologies and evaluating project specific emissions from stationary sources and development projects. The proposed process for establishing BPS builds upon this experience. In developing BPS District staff will solicit input from industry, manufacturers, academia, environmentalists, environmental justice groups, regulatory agencies, and other members of the public, as well as utilize the technical expertise and experience of the District's staff.

In establishing BPS for a specific equipment or operation the District's initial focus will be to establish BPS for equipment and operations that are commonly permitted or representing larger sources of GHG emissions. It is anticipated that initial Classes and Categories will be general in nature, covering a broad range of GHG emission sources. These broad categories will be refined and narrowed in scope as projects pass through the BPS development process and through associated permitting processes.

5.2.2 Public Process

BPS will be established through a public process that provides ample opportunity for stakeholders and other interested parties to participate and provide valuable input into the establishment of baseline GHG emissions and BPS.

The public process will begin with an initial outreach via the District's CCAP list server. Individuals registered with the CCAP list server will be notified when the District initiates the process of establishing BPS for a specific equipment or operation within an identified Class and Category. Individuals interested in participating in the public process would register themselves with a list server dedicated to the BPS under development. Using the dedicated BPS list server, stakeholders and other interested parities will have opportunity to provide the District with information to be considered when drafting documents establishing baseline GHG emissions and BPS. When draft documents are available on the District's website for review and comment, a notice of availability will be send via the BPS list server. Workgroups would be convened as necessary to obtain additional technical information for use in establishing baseline emissions or BPS. After receiving public input, the BPS will be finalized and posted on the District's website. Availability of final BPS will be noticed via the District's general CCAP list server.

5.2.3 Process for Establishing BPS - Stationary Source Projects

5.2.3.1 Introduction

To be approved by the District, BPS must be demonstrated to achieve real GHG emission reductions. Such reductions must be quantifiable to support a determination that project specific GHG emissions would have a less than significant individual and cumulative impact.

In evaluating GHG emissions from a specific project the District will characterize both direct and indirect emissions. Direct GHG emissions would include emissions resulting from the specific operation or process, e.g. exhaust emissions from a boiler. Indirect GHG emissions would include GHG emissions resulting from project related energy consumption, and electricity consumed by the production and transport of water used by the project. For projects resulting in increased vehicle miles traveled (VMT), indirect GHG emissions associated with transportation related activities would also be included in the GHG emissions quantification.

To ensure that the criteria discussed above are satisfied, the District proposes the following process to establish BPS:

5.2.3.2 Process for Establishing BPS for Stationary Source Projects

1. Establish Baseline GHG emissions factor per unit of activity for the proposed equipment or operation identified within a specific class and category

2. For the specific equipment or operation being proposed within a specific class and category, list all technologically feasible GHG emissions reduction measures, including equipment selection, design elements and best management practices, that do not result in an increase in criteria pollutant emissions compared to the proposed equipment or operation

3. For all technologically feasible GHG emission reduction measures identified in steps 2, identify all GHG reduction measures determined to be Achieved-in-Practice. In determining Achieved-in-Practice, consider the extent to which grants or other financial subsidies influence economic feasibility.

4. For each Achieved-in-Practice GHG emission reduction measure identified in steps 3:
   a. Quantify the potential GHG emission reduction, as compared to the Baseline GHG emissions factor per unit of activity
   b. Express the potential GHG emission reduction as a percent of Baseline GHG emissions factor per unit of activity

5. Rank all Achieved-in-Practice GHG emission reduction measures by order of percent GHG emissions reduction,

6. Deem the Achieved-in-Practice GHG emissions reduction measure(s) with the highest percent reduction in GHG emissions as the District approved Best Performance Standard (BPS) for the respective class and category of equipment or operation being proposed, and

7. Eliminate all other Achieved-In-Practice options from consideration as BPS

5.2.4 Process for Establishing BPS - Development Projects

5.2.4.1 Introduction

GHG emission from development projects primarily occur indirectly through energy consumption and vehicle miles traveled (VMT). Developers can reduce GHG emissions from energy consumption through building designs that increase energy efficiency, water conservation, and the use of energy efficient appliances. Developers can further reduce GHG emissions through project designs that reduce VMT through features that promote pedestrian access and use of public transportation. Land use planning decisions, such as creating mixed-use development, discouraging leap-frog development, and creating favorable jobs to housing ratios can significantly reduce VMT and the associated GHG emissions. For the purpose of this guidance a development project is any project, or portion thereof, that is subject to a discretionary approval by a public agency, and will ultimately result in the construction of a new building, facility, or structure, or reconstruction of a building, facility, or structure.

In should be noted that ARB considered only GHG emissions from energy consumption when establishing baseline and BAU emissions for development projects. ARB addresses VMT emission reduction strategies as part of transportation related impacts. However, District staff considers reducing VMT emissions attributable to development projects to be an integral component of the District's attainment strategy, and inclusion of proposed BPS to be a logical extension of that effort.

Given the diversity of development projects occurring in the Valley, it is not feasible to develop a single set of standards that would be applicable to all development projects. Instead, the District will establish a list of GHG emission reductions measures with pre-quantified GHG emission reduction effectiveness. Projects implementing BPS and reducing GHG emissions by 29% through any combination of GHG emission reduction measures, including GHG emission reductions achieved as a result of changes in building and appliance standards occurring since the 2002-2004 baseline period, would be considered to have a less than significant individual and cumulative impact on global climate change.

5.2.4.2 Process for Establishing BPS for Development Projects

To be approved by the District, GHG emissions reduction measures used to meet BPS must be demonstrated to achieve real GHG emission reductions. Such reductions must be quantifiable to support a determination that project specific GHG emissions would have a less than significant individual and cumulative impact. To ensure that these criteria are satisfied, the District proposes the following process to establish BPS.

1. Establish Baseline GHG emissions factor per unit of activity for residential, commercial and industrial development projects

2. For the specific development type (Residential, Commercial or Industrial), list all achieved-in-practice GHG emissions reduction measures, including building design elements, building and appliance standards, project design elements; and land use decisions

3. For each achieved-in-practice GHG emission reduction measure identified in step 2:

   a. Quantify the potential GHG emission reduction, as compared to the Baseline GHG emissions factor per unit of activity, and
   b. Express the potential GHG emission reduction as a percent of the Baseline GHG emissions factor per unit of activity

4. Any combination of approved GHG emissions reduction measures achieving a combined 29% of GHG emissions compared to the established Baseline GHG emissions factor per unit of activity is considered **Best Performance Standard** (BPS) for the respective type of development project.

5.3 Process for Reviewing Established Best Performance Standards

Implementation of strategies to achieve AB 32 emission reduction targets is anticipated to drive technology development, potentially obsolescing or improving established standards over time. Therefore, the District is proposing a process that will result in periodic review of adopted Best Performance Standards and emerging technologies. To ensure that Best Performance Standards reflect the most current available technology, the District will conduct annual reviews and revise established Best Performance Standards, if necessary, to include new and improved technologies. Revisions to BPS will only be applicable to future projects and would not be applied retroactively to projects already permitted or approved.

<u>Project-by-Project Basis</u>

Project proponents or other members of the public may propose other technologies, equipment designs, or operational/maintenance practices. When proposed by a project proponent in lieu of an adopted Best Performance Standard, the District will evaluate the proposed GHG emission reduction measure. If demonstrated to be equivalent to or better than District approved BPS, the proposed GHG emission reduction measure will be added to the list of approved BPS. If demonstrated to be superior to District approved BPS and achieved-in-practice, the proposed GHG emission reduction measure will replace the existing District approved BPS for future projects.

<u>Annual Evaluation</u>

The District will evaluate BPS on an annual basis. District approved BPS will be compared to newly identified GHG emission reduction measures, if available. If demonstrated to be equivalent to District approved BPS, new GHG emission reduction measures will be added to the list of approved BPS. If demonstrated to be superior to District approved BPS and achieved-in-practice, new GHG emission reduction measures will replace existing District approved BPS for future projects.

5.4 Best Performance Standards

During the public participation process for developing this guidance, the District received comments that the discussion of BPS should be supported by specific examples of BPS for major sources of GHG emissions. In response, the District has prepared the following illustrative examples of potential BPS. It should be noted that these examples of BPS are for illustrative purposes only, and should not be used by any lead agency as District-approved or sanctioned standards. As discussed further in this staff report, the proposed process of establishing BPS provides opportunity for public input into the development of BPS, and final BPS can only be established after such a process.

5.4.1 Best Performance Standards for Stationary Source Projects

Introduction

The District's existing CEQA Implementation District Procedure establishes a methodology to consistently evaluate potential environmental impacts from stationary source projects. This internal procedure document will be amended to incorporate requirements associated with the GHG emissions significance determinations. A particular effort will be made to streamline the process of GHG emissions impact evaluation, consistent with the best performance standard-based determination of significance discussed in this staff report.

5.4.2 Illustrative Examples of Best Performance Standards for Stationary Source Projects

The following discussion illustrates possible BPS, as presented in Appendix I, for stationary source projects and provides the bases and/or rationale for each, as well as an assessment of potential GHG emissions reduction impact relative to a 2002-2004 emissions inventory baseline.

It should be noted that these examples of BPS are for illustrative purposes only, and should not be used by any lead agency as District-approved or sanctioned standards. As discussed further in this staff report, the proposed process of establishing BPS provides opportunity for public input into the development of BPS, and final BPS can only be established after such a process.

1. Fossil Fuel-fired Boilers, Steam Generators and Process Heaters with Firing Capacity > 5 MMBtu/hour (HHV)

Illustrative BPS:

All units shall utilize gaseous fuel only and be appropriately sized and/or have adequate load following capability to avoid the venting of steam to the atmosphere except during emergency situations or during specifically identified and limited maintenance or startup/shutdown operations essential to the unit operation. In addition, each unit shall meet at least one of the two following criteria:

(1) The unit shall be designed for a minimum thermal efficiency of 95 % and shall utilize a variable frequency drive electric motor on combustion air/FGR fans or,
(2) The unit shall be designed for maximum thermal efficiency by incorporating all of the following design features: a) install adequate heat transfer surface to provide a maximum design approach of 20 °F between the stack gas temperature and the process inlet temperature, b) limit the use of flue gas recirculation (FGR) for NOx control to no more than 10 % , c) minimize excess air in combustion by

maintaining a maximum O_2 concentration of 3 volume percent in the stack gas and d) use a variable frequency drive electric motor on combustion air/FGR fans

BPS Determination

The proposed BPS for this category represents the best Achieved-in-Practice technology identified, and consists of a collection of current state-of the-art, achieved-in-practice design and operational practices for achieving maximum practical thermal efficiency and limiting GHG production. These consist of the following three elements:

1. Use of gaseous fuel which has a lower carbon content per Btu than liquid or solid fuels and thus provides lowest GHG emissions per Btu fired.

2. Appropriate boiler sizing with load following capability to minimize potential steam venting (and the associated excess GHG emissions). This requirement results in a boiler installation having sufficient turndown capability and operating flexibility to match the thermal demand without venting any steam. This may require installation of multiple smaller units rather than a single large unit and may require specific design features in the burner and controls to provide adequate load-following capability.

3. Maximum practical thermal efficiency achieved by either of the two following options:

   BPS Option 1:

   A fully condensing boiler with a minimum efficiency of 95%. For units without air preheaters, this efficiency level can only be achieved in cases where the process side inlet temperature is below 100 ^oF. Typically a boiler with 100% cold makeup would lie in this category (a tomato processing facility typically operates in this fashion).

   and,

   Utilize a variable speed electric motor on all flue gas fans to provide energy savings whenever the unit is not operating at maximum capacity.

   BPS Option 2:

   Maximize the thermal efficiency by implementing a heat recovery design based on a maximum approach of 20 ^oF between the stack gas temperature and the process inlet temperature. This represents a maximum practical achieved-in-practice heat recovery

   and,

Limit FGR to 10 % to save power on fan operation, allow lower excess air levels in the stack and improve turndown and load following response for the unit. This specification may, in effect, require use of Selective Catalytic Reduction (SCR) for NO_x emissions control in some applications. Operation with a high FGR rate requires a significantly increased horsepower for the combustion air fan operation due both to increased volumetric flow and to increased pressure drop in the unit. Additionally, operation with high FGR rates for NO_x control reduces burner stability and response and results in stack O_2 concentrations as high as 4-5% versus a more efficient 3% O_2 achievable with limited FGR rates

and,

Limit the concentration of O_2 in the stack gas to 3%. This value for O_2 concentration allows minimizing energy loss to the stack while still maintaining adequate safety margin in the operation. As mentioned above, limiting FGR rate to 10% makes this low concentration operation feasible

and,

Utilize a variable frequency drive (VFD) electric motor on all flue gas fans to provide energy savings whenever the unit is not operating at maximum capacity.

To assess the potential impact of the proposed BPS, specific equipment configurations have been established which are assumed to represent the typical (average) equipment in this category in existence at the time of the 2002-2004 emissions inventory:

Boiler: 150 psig steam boiler not equipped with an economizer, producing saturated steam at 150 psig (367 ^oF), feed water at 200 ^oF, stack temperature 407 ^oF (40 ^oF approach) and stack O_2 concentration of 4.5 %. Fan driver is a standard efficiency (85%) electric motor. Flue gas recirculation for NO_x control is 40% of total flue gas.

Steam Generator: 1250 psig steam generator producing 1250 psig steam at 65 % quality, feed water at 140 ^oF, operating at 80% of maximum rate. Stack temperature is 280 ^oF (140 ^oF approach) with 4.5 % O_2. Fan driver is a standard efficiency (85%) electric motor. Flue gas recirculation for NO_x control is 40% of total flue gas.

Process Heater: Refinery heater with 350 ^oF process inlet temperature, operating at 80 % of maximum rate with a stack temperature of 430 ^oF (80 ^oF approach) and stack O_2 concentration of 4.5%. Fan driver is a standard efficiency (85%) electric motor. Flue gas recirculation for NO_x control is 20% of total flue gas.

The following table compares the expected thermal efficiencies and GHG emissions from each equipment category during the baseline years with that which would be attained from implementation of BPS:

Summary of BPS and achieved GHG emission reductions:

BPS for: Boilers, Steam Generators and Process Heaters					
Equipment Category	**Baseline**		**Best Performance Standard**		**GHG Emission Reduction (%)**
	Thermal Efficiency (%)	GHG Emissions (lb-CO_2/MMBtu)	Thermal Efficiency	GHG Emissions (lb-CO_2/MMBtu)	
Boiler	80.6	148	**85.9**	137	**7.4%**
Steam Generator	84.0	142	**87.4**	135	**4.9%**
Process Heater	80.0	148	**82.3**	143	**3.4%**

The emission calculations for BPS in the preceding table assume that a Selective Catalytic Reduction (SCR) system has been installed for NO_x emission control and include the emissions associated with the production of ammonia required for the SCR operation. The calculations also include the impact of reduced electric power requirement for fans associated with BPS.

<u>Compliance Assurance</u>

The BPS for this category shall be enforced through design standards, equipment description, and permit conditions.

The following permit conditions will apply:

- *In order to minimize Green House Gas emissions and optimize equipment efficiency, all equipment shall be operated in accordance with manufacturer specifications and approved design specifications. [California Environmental Quality Act]*

- *The flue gas recirculation (FGR) rate shall not exceed 10%. [California Environmental Quality Act]*

- *Oxygen concentration in the flue gas shall not exceed 3 percent by volume. [California Environmental Quality Act]*

<u>Alternate Approved Technology</u>

Other approved technologically feasible GHG emission reduction measures which are not achieved-in-practice, but offer GHG emissions reductions equal to or greater than the identified BPS are:

- Install equipment utilizing a solar energy source in lieu of fossil fuel.
- Obtain equivalent GHG emission performance by recovery and permanent sequestration of CO_2 from the exhaust of the unit.
- Fire unit with biogenic fuel derived from renewable natural or waste sources (fuels derived from agricultural operations performed specifically for fuel production do not meet this criteria)

2. Non-Emergency Flares With Rated Heat Release > 5 MMBtu/hour (HHV)

Illustrative BPS:

Combustion shall be performed in an alternate device in lieu of a flare which produces useful energy which would have otherwise been required (utilized as fuel in an engine, boiler, turbine or delivered to a natural gas pipeline, etc.) where the proposed operation is non-emergency. Emergency flares shall utilize a flow-sensing ignition device rather than a continuous pilot and non-GHG purge gas.

<u>BPS Determination</u>

The proposed BPS for this category represents the most stringent Achieved-in-Practice technology currently recognized consisting of a requirement to utilize the heating value of the material to be combusted in a device (other than a flare) which produces useful energy rather than simply exhausting the energy to the atmosphere as does a flare. Production of useful energy implies that GHG emission reductions are achieved by offsetting other energy consumption which would have been required in any event. For emergency-only flares, which are not considered to be a major source and may be a requirement for protection of public health and safety, the use of a flare may be allowed but the flare is required to operate with a flow sensing ignition system and use only non-GHG gas for purge gas to minimize GHG emissions.

To demonstrate the impact of the proposed BPS, the equipment being operated during the 2002-2004 emission inventory baseline is assumed to be a flare rated at 50 MMBtu/hr, operating at an average utilization of 50% combusting a hydrocarbon stream and utilizing a continuous natural gas-fired pilot consuming 3 scfm of natural gas for pilot and purge operations. Such a flare has estimated GHG emissions of 12,900 tons CO_2E per year. Combusting the fuel in a typical natural gas-fired engine/generator operating with a heat rate of 12,160 Btu per kWh (HHV) produces 18,140 megawatt-hours of electric power per year. This offsets approximately 7,970 tons per year of GHG emissions from utility power plants based on a California electric utility emission rate of 879 lb-CO_2/MWh (EPA eGrid data for 2004). Net GHG emissions are then determined to be 12,900 – 7,970 = 4,930 tons per year or a reduction of 62 percent.

For an emergency-only flare, the requirement to use a flow sensing ignition system would eliminate the fuel consumption by the continuous pilot and eliminate 100% of all routine GHG emissions.

Summary of BPS and achieved GHG emission reductions:

BPS for: Non-Emergency Flares			
Baseline	**BPS**	**GHG**	**GHG Emission Reduction (%)**
Flare With Continuous Pilot	Utilize Alternate Device Producing Useful Energy (Gas-Fired Engine/Generator)	CO_2	**62%**

Compliance Assurance

The BPS for this category shall be enforced through design standards, equipment description, and permit conditions.

The following permit conditions will apply:

- *In order to minimize Green House Gas emissions and optimize equipment efficiency, all equipment shall be operated in accordance with manufacturer specifications and approved design specifications. [California Environmental Quality Act]*

Approved Alternate Technology

An approved technologically feasible GHG emission reduction measure which is not achieved-in-practice, but offers GHG emissions reductions equal to or greater than the identified BPS is:

- Obtain GHG emission performance equivalent to BPS by recovery and permanent sequestration of CO_2 from the exhaust of the unit.

3. Non-Emergency Onsite Electric Power Generation with Fossil Fuel Combustion > 5 MMBtu/hour or With Fossil Fuel-Fired Mechanical Driver > 50 bhp.

Illustrative BPS:

Electric power supply shall be provided solely by a PUC-licensed electric utility in lieu of a fossil fuel-fired unit except for facilities meeting any of the following criteria:

1. *Emergency standby power generation, or*
2. *Power generation from a cogeneration unit*

BPS Determination

The proposed BPS for this category represents the most stringent Achieved-in-Practice technology currently recognized consisting of a requirement to utilize electric power obtained from the public utility electric power grid rather than produce power for private use except for cases where standby emergency power is required. Generation of emergency standby power is not considered to be significant source and thus no specific BPS is required for this case. Cogeneration units

are covered by a separate BPS and are required by the BPS for that class of operation to generate electric power with an incremental GHG emissions rate which is lower than the emissions rate for electric utility generation in California.
To assess the potential impact of the proposed BPS, the equipment operated during the 2002-2004 baseline emission inventory is assumed to be a natural gas-fired IC engine powering a generator and operating at a typical heat rate of 13,000 Btu/kWh (HHV). Expected GHG emissions are 1.52 lb-CO_2/kWh. Converting this operation to utility-supplied electric power per the BPS would yield an alternative emission factor of 0.879 lb-CO_2/ kWh (per EPA eGrid emission data for California (2004)). Net emission reduction from the base case would therefore be 1.52 – 0.879 = 0.64 lb-CO_2/ kWh or 42 %.

Summary of BPS and achieved GHG emission reductions:

BPS for: Non-Emergency Onsite Electric Power Generation			
Baseline	**BPS**	**GHG**	**GHG Emission Reduction (%)**
Natural Gas Engine/Generator	Utility-Supplied Power	CO_2	**42%**

<u>Compliance Assurance</u>

Since compliance with the BPS is achieved by meeting the design standard (installation of an electric motor which does not require a District permit), no enforcement provisions are applicable or necessary.

<u>Approved Alternate Technology</u>

Three other approved technologically feasible GHG emission reduction measures which are not achieved-in-practice, but offer GHG emissions reductions equal to or greater than the identified BPS are:

- Utilize solar energy source in lieu of firing fossil fuels.
- Obtain GHG emission performance equivalent to BPS by recovery and permanent sequestration of CO_2 from the exhaust of the unit.
- Utilize biogenic fuel derived from renewable natural or waste sources in lieu of fossil fuel (biogenic fuels derived from agricultural operations performed specifically for fuel production do not meet this criteria)

4. Non-Emergency Mechanical Equipment Driver (requirement in lieu of reciprocating IC engines > 50 hp and combustion turbines > 3 MMBtu/hour excluding combustion turbines in cogeneration service)

Illustrative BPS:

A non-emergency mechanical equipment driver shall consist of an electric motor, in lieu of a fossil fuel-fired unit, with energy efficiency meeting the efficiency criteria for Premium Efficiency Electric Motors as specified in the National Electical Manufacturer's Association (NEMA) Standard MG-1 or, upon District approval of submitted documentation which corroborates a claim by the applicant that such electric motor is not feasible, applicant may install a motor with efficiency equal to the maximum available for the proposed class of motor.

<u>BPS Determination</u>

The proposed BPS for this category, applicable to both proposed stationary and transportable operations, represents the most stringent Achieved-in-Practice technology currently recognized consisting of a requirement to utilize a premium efficiency electric motor in lieu of a fossil fuel-fired device (IC engines, gas turbines, etc.) to power mechanical equipment such as pumps and compressors. This BPS achieves GHG emission reductions due to the average emission rate for power production at utility power plants being lower than that which can be achieved by a fossil fuel-fired equipment driver. The specification of premium efficiency for the electric motor per the stated NEMA standard may not be universally applicable for certain specialized motors which is recognized in the BPS by allowing a lower efficiency based on approved documentation attesting to the infeasibility of the premium efficiency standard.

An electric motor offers lower GHG emissions than any available fossil fuel-fired equipment driver. Assuming a premium 95 % efficient motor, energy use per brake horsepower is 0.7457 kWh/bhp-hr ÷ 95% = 0.785 kWh/bhp-hr. For California, GHG emissions for electricity use are 0.879 lb/kWh (per EPA eGrid emission data for California (2004)) which results in an electric motor GHG emission factor of 0.69 lb-CO_2/bhp-hr. For comparison, a standard efficiency motor at 85% has an emissions factor of 0.77 lb-CO_2/bhp-hr. As a base case to represent equipment operated during the 2002-2004 emission inventory baseline, a natural gas-fired IC engine with a heat rate of 9500 Btu/hp-hr (HHV) is assumed which has a CO_2 emission rate of 1.11 lb-CO_2/hp-hr (approximately 10% higher than currently available engines). Comparing the natural gas engine as a base case with a premium efficiency electric motor (BPS) based on the above values, a potential GHG emission reduction of 47% is indicated.

Summary of BPS and achieved GHG emission reductions:

BPS for: Non-Emergency Mechanical Equipment Driver			
Baseline	**BPS**	**GHG**	**GHG Emission Reduction (%)**
Natural Gas Engine	Premium Efficiency Electric Motor	CO_2	**47%**

<u>Compliance Assurance</u>

Since compliance with the BPS is achieved by meeting the design standard (installation of an electric motor which does not require a District permit), no enforcement provisions are applicable or necessary.

<u>Approved Alternate Technology</u>

Two other approved technologically feasible GHG emission reduction measures which are not achieved-in-practice, but offer GHG emissions reductions equal to or greater than the identified BPS are:

1. Power equipment using a renewable energy source such as solar or wind in lieu of fossil fuel.
2. Utilize biogenic fuel derived from renewable natural or waste sources in lieu of fossil fuel (fuels derived from agricultural operations performed specifically for fuel production do not meet this criteria).

5. Fossil Fuel-Fired Cogeneration (combustion turbines > 3 MMBtu/hr or other combustion devices > 5 MMBtu/hour)

Illustrative BPS:

Fossil fuel- fired cogeneration systems shall be designed to achieve an incremental GHG emission rate not exceeding 700 lb-CO_2 per MWh at the system's design operating point based on power output at the generator terminals, assuming the process thermal demand could alternatively be met by direct fuel firing with 90% thermal efficiency. Heat recovery design shall maximize thermal efficiency by installing adequate heat transfer surface to provide a maximum 20 ^oF approach between stack gas temperature and the process inlet temperature

<u>BPS Determination</u>

Well-designed gas turbine cogeneration systems are generally capable of achieving incremental GHG emission rates below 700 CO_2/MWh depending upon the specific system design and the extent to which the gas turbine operating profile matches the required process thermal load. This standard provides significantly lower emissions when compared to the capacity-rated average emission factor of 915 lb-CO_2/MWh for existing base-loaded combined cycle gas turbine power plants (CCGT) in California based on 2004/2005 CEMS data as stated in the Public Utilities Commission (PUC) Decision 07-01-039 (1/25/07), <u>Greenhouse Gas Emissions Performance Standard</u>. A cogeneration system operating per the BPS would thus supplant base loaded CCGT electricity in California, providing an emission reduction of 915 – 700 = 215 lb-CO_2/MWh or a reduction of 24 %. The BPS also significantly exceeds the performance standard of 1,100 lb- CO_2/MWh for new base load CCGT power generation as adopted by the PUC in the above-referenced Decision 07-01-039. Recognizing that a well designed cogeneration project can inherently produce power at a lower incremental GHG emission rate than the electric utility, selection of a BPS of 700 lb CO_2/MWh seeks to effectively promote efficient cogeneration projects by establishing a standard which generally be achieved by most commercially available gas turbines when applied to a well-designed project while establishing a significant margin below the current GHG emission rate of base loaded utility CCGTs. The heat recovery specification of this BPS requires a 20 ^{o}F approach between process inlet temperature and the stack gas temperature which ensures both a state-of-the-art efficiency in the heat recovery design and an efficient overall cogeneration system design.

Since this category of equipment generates electric power for the utility grid and would most likely supplant baseload CCGT power, equipment operated during the 2002-2004 emission inventory baseline is assumed to be the measured average for baseload CCGT power generation stated above:

Summary of BPS and achieved GHG emission reductions:

BPS For: Fossil Fuel-Fired Cogeneration			
Baseline	**BPS**	**GHG**	**GHG Emission Reduction (%)**
Baseload Electric Utility CCGT Power Plant	Fossil-Fueled Cogeneration System with GHG Emission Rate Not Exceeding 700 lb CO_2/MWh	CO_2	24%

<u>Compliance Assurance</u>

The BPS for this category shall be enforced through design standards, equipment description, and permit conditions.

The following permit conditions will apply:

- *In order to minimize Green House Gas emissions and optimize equipment efficiency, all equipment shall be operated in accordance with manufacturer specifications and approved design specifications. [California Environmental Quality Act]*

Approved Alternate Technology

An approved technologically feasible GHG emission reduction measure which is not achieved-in-practice, but offers GHG emissions reductions equal to or greater than the identified BPS is:

- Utilize biogenic fuel derived from renewable natural or waste sources in lieu of fossil fuel (biogenic fuels derived from agricultural operations performed specifically for fuel production do not meet this criteria)

6. Landfill Operations

Illustrative BPS:

Landfills shall comply with CARB Regulation to Reduce Methane Emissions From Municipal Solid Waste Landfills[8].

BPS Determination

The proposed BPS for this category represents the most stringent Achieved-in-Practice GHG emission control method and consists of the following element:

Landfills are a major source of methane emissions. Landfills shall comply with CARB Regulation *to Reduce Methane Emissions From Municipal Solid Waste Landfills.* As organic matter inside the landfill decomposes in the oxygen deficient subterranean environment, methane is released as a byproduct of the anaerobic decomposition. The methane migrates upwards to the surface of the landfill where it is emitted into the atmosphere through pores, cracks and fissures on the landfill surface. Methane may also migrate through underground channels and waterways and be emitted at other locations far from the landfill.

Currently, many landfills are required to install and operate a methane capture and control system. Such a system typically consists of wells sunk into the

[8] www.arb.ca.gov/regact/2009/landfills09/isor.pdf

landfill and connected to a vacuum pump to draw the Methane to a central location instead of allowing it to escape as fugitives from the landfill surface. Once collected, the gas may be flared of or combusted in an energy recovery device such as an IC engine. The methane is converted to CO_2, which is a much less potent GHG, during the combustion. Energy recovered may also displace the use of non-renewable fossil fuels such as diesel, thereby providing an added GHG reduction benefit.

The proposed *CARB Regulation to Reduce Methane Emissions From Municipal Solid Waste Landfills*, which is due to be adopted in early 2010, will enhance capture and control of CH4 from municipal waste landfills. The regulation is expected to reduce CH4 emissions by about 0.07 million metric tons[9], which represents a reduction of approximately 23.8% from current standards.

The regulations includes CH4 reduction strategies such as installation of collection and control systems for landfills that would otherwise be exempt by current regulations, design of collection and control systems to capture maximum amounts of CH4 produced, continuous operation of CH4 control equipment, Improved leak standards (200 ppmv) for CH4 collection and control system components as well as landfill surface emissions, 99% CH4 destruction efficiency for flares and methane-fire energy recovery devices, and other enhanced source testing, inspection, monitoring and operating standards.

This BPS is considered achieved in practice because it represents a strengthening and tightening of existing CH4 control methods, rather than an introduction of new or previously untested methods. As previously stated, many landfills are currently required to install CH4 capture and control systems, typically consisting of collection wells connected to a vacuum pump and a flare for combustion of the captured gas. Fugitive landfill surface CH4 emissions must also be monitored. Although not currently required, some landfills use the collected CH4 for electricity generation or heating.

This BPS would require that additional landfills that are currently exempt or not required to install capture and control systems be required to do so. In addition, the BPS will require that the capture systems be designed for maximum extraction of CH4 in order to minimize fugitive emissions that are often due to poor capture efficiency. The BPS will also require maximum efficiency, 99%, in the control of the captured CH4.

Thus, all of the elements that constitute the BPS are methods currently in use in one form or another. When such control methods are applied in a more rigorous

[9] www.arb.ca.gov/regact/2009/landfills09/isor.pdf, Page ES-2

and effective manner, over a larger number of sources, significant CH4 reductions can be realized.

Summary of BPS and achieved GHG emission reductions:

BPS for: Landfill Operations				
Category	**Baseline**	**BPS**	**GHG**	**GHG Emission Reduction (%)**
Landfills	The baseline scenario is that some landfills are currently required to have Methane capture and control systems, but the standards are not as stringent as proposed in the BPS	Landfills shall comply with CARB Regulation to Reduce Methane Emissions From Municipal Solid Waste Landfills	CH4	**23.8%**

Compliance Assurance

The BPS for this category shall be enforced by a combination of design standards, equipment description and permit conditions.

The following permit conditions will apply:

- *In order to minimize Green House Gas emissions and optimize equipment efficiency, all equipment shall be operated in accordance with manufacturer specifications and approved design specifications. [California Environmental Quality Act]*

- *Landfills shall comply with all emission limits, operation, inspection, source testing and monitoring requirements as approved under the CARB Regulation to Reduce Methane Emissions From Municipal Solid Waste Landfills. [California Environmental Quality Act]*

7. Wastewater Treatment Operations

Illustrative BPS:

Wastewater treatment facilities shall incorporate both of the following two control measures:

(1) Sludge: Sludge shall be treated anaerobically in digesters, with captured methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment; and

(2) Liquid Waste: At least 33% of electricity used for liquid waste aeration shall be derived from renewable energy sources, based on grid power the Renewables Portfolio Standard (RPS), and/or supplementation of grid with onsite generation using renewable energy sources such as, but not limited to, biogas, biomass, solar, and wind.

BPS Determination

The proposed BPS for this category represents only Achieved-in-Practice emission control methods, and consists of the following elements:

1. Sludge shall be treated anaerobically in digesters, with captured methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment: Anaerobic treatment of sludge is achieved in practice because it is commonly used by municipal wastewater plants. Some smaller plants, however, may use some form of aeration or aerobic treatment for sludge.

   The sludge is typically treated in a covered tank digester. The captured methane may be flared or, again depending on the size of the treatment plant, used to generate supplemental electricity onsite. Many treatment plants currently use IC engines for generation of electricity from methane, although some use fuel cells. This BPS will require anaerobic treatment of sludge, maximum capture of Methane, and the use of captured methane for energy recovery in a method that displaces current or required use of fossil fuels.

Such methods may include generation of onsite electricity using equipment, such as a fuel cell, that emits less GHG and criteria pollutants than grid power generation, the injection of purified biogas into natural gas pipeline, or compressing the gas and using it to power mobile equipment such as trucks.

2. Electricity generation using fossil fuels such as natural gas, oil and coal is a major contributor to global warming emissions, increased use of non-fossil fuels or renewable energy sources such as biogas, biomass, wind and solar will result in the reduction of GHG emissions.

   Water and wastewater services account for up to 4% of all electricity consumption nationally, and 6.9% of all electricity consumption in California10. A significant proportion of this energy consumption goes toward the treatment of wastewater. Further, approximately 50% of the electricity consumed by a typical wastewater treatment plant is used for the aeration of the wastewater11.

   The aeration process involves the bubbling of air into the water to provide oxygen for aerobic microbes that digest organic matter in the water. Electric pumps are used to force air into the water.

   Since 2002, power suppliers in California have been required to procure a certain percentage, known as the Renewables Portfolio Standard (RPS), of electricity from renewable sources. In 2002, Senate Bill 1078 set the RPS at 20% by 2017, meaning that by 2017 power suppliers were to procure at least 20% of their electricity from renewable sources. In 2003 the RPS was accelerated to 20% by 2010, and in 2008 the Governor issued an Executive Order setting a higher RPS standard at 33% by 2020.

   Thus, the use of an RPS is an achieved-in-practice method for the control of emissions associated with electricity consumption. The District therefore considers the application of the current RPS to be a BPS for wastewater aeration. The proposed BPS will require wastewater facilities to implement the 33% RPS, for electricity used in wastewater aeration, as a condition of approval. Since grid power is not expected to attain a 33% RPS until 2020, facilities seeking approval prior to 2020 will have to supplement grid power with onsite generation using renewable energy sources such as, but not limited to, biogas, biomass, wind and solar.

[10] http://www.energy.ca.gov/2004publications/CEC-500-2004-901/CEC-500-2004-901.PDF, page 2
[11] http://www.energy.ca.gov/process/pubs/encina.pdf, page 2, Aeration.

The baseline RPS, based on the AB32 scoping plan, is 12%[12]. Thus, the application of a 33% RPS will result in a reduction of 21% of GHG emissions from electricity used in wastewater aeration.

Approved Alternate Technology

An approved technologically feasible GHG emission reduction measure which is not achieved-in-practice, but offers GHG emissions reductions equal to or greater than the identified BPS is:

- Wastewater shall be treated anaerobically in digesters or covered ponds, with captured Methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment.

Currently, wastewater plants separate sewage into two main streams: biosolids/sludge and liquid sewage. The biosolids are generally treated anaerobically in digesters and the produced Methane gas is captured and used for onsite electricity or heat generation. The liquid sewage is treated aerobically in large aeration ponds or ditches in which air if forcefully bubbled. Aerating the liquid sewage is a very energy intensive process, considering that oxygen is not soluble in water. If treatment of liquid sewage were to be done anaerobically there would be large reductions in the energy required for wastewater treatment, and a corresponding reduction in GHG emissions associated with power generation. In addition, anaerobic treatment of liquid sewage would large quantities of Methane, which can be used as a renewable energy source to replace fossil fuel use.

Since liquid waste aeration is responsible for approximately 50% of electricity consumption at a typical wastewater treatment plant, the use of anaerobic treatment of the liquid waste can cut electricity use by 50%, which represents a corresponding 50% reduction in CO_2 emissions associated with liquid waste aeration.

Anaerobic treatment is the process in which anaerobic microbes (those that do not require oxygen for respiration) digest organic matter and produce Methane and water as byproducts. Anaerobic treatment is a passive process that does not require the use of much energy, except in some cases sometimes heat is required to accelerate the process, especially in very cold climates.

Anaerobic treatment is widely used in California for onsite wastewater treatment by facilities such as dairies, wineries, cheese plants, slaughterhouses and other industrial sources use anaerobic treatment. In many cases anaerobic treatment of the wastewater is coupled with a methane capture system and the use of the

[12] http://www.arb.ca.gov/cc/scopingplan/document/adopted_scoping_plan.pdf, Page 46.

captured methane for onsite electricity generation or heating. Several dairies have also demonstrated other renewable energy recovery methods such as injection of purified biogas into the natural gas pipeline, and use of compressed biogas as mobile equipment fuel. Such onsite treatment facilities generally handle a small quantity of wastewater with a high oxygen demand. The District also was able to identify one municipal wastewater treatment plant that uses anaerobic treatment for the liquid portion of the waste[13]. The treatment plant, located in the United Kingdom, is a small facility handling wastewater from a population of 5,000.

Based on this information, the District concluded that, although technologically feasible, anaerobic treatment of municipal wastewater, at a scale required to serve a typical city or municipality, is not achieve-in-practice.

The main difficulty with the use anaerobic treatment is the large quantity of wastewater handled at typical municipal treatments plants. Since anaerobic treatment is a much slower process requiring sequestration in ponds or tanks for at least several days, the volume and space that would be required for treatment at typical municipal plants would be prohibitive.

However, anaerobic treatment of wastewater is a field that is being actively researched. One of the main objectives of the on-going research is the reduction of the hydraulic retention time required for proper treatment time. For instance, in a recent study published in the International Journal of Environmental Science and Technology, researchers were able to demonstrate using a laboratory scale that anaerobic treatment of wastewater using a method known as Hybrid Upflow Anaerobic Sludge Blanket (HUASB) Reactor reduced the required hydraulic retention time to 3.3 hours[14].

It is therefore possible that in the near future this treatment method will become more and more practical for application to large municipal wastewater treatment facilities.

[14] Banu, J.R.; Kaliappan, S.; Yeom, I.T., (2007). Treatment of domestic wastewater using upflow anaerobic sludge blanket reactor. Int. J. Environ. Sci. Tech., 4 (3), 363-370.

Summary of BPS and achieved GHG emission reductions:

BPS for: Wastewater Treatment Operations				
Operation	**Baseline**	**BPS**	**GHG**	**GHG Emission Reduction (%)**
Sludge Treatment	Baseline period standard practice is the treatment of sludge anaerobic digesters, with energy recovery for some facilities and flaring for others	(1)Sludge shall be treated anaerobically in digesters, with captured methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment; and	CH4	**0% (not quantifiable due to variability in current use of captured CH4)**
Wastewater Treatment	Baseline renewables portfolio, per AB32 Scoping Plan, is 12%	(2) At least 33% of electricity used for wastewater aeration shall be derived from renewable energy sources, based on grid power Renewables Portfolio Standard (RPS), and/or supplementation of grid with onsite generation using renewable energy sources such as, but not limited to, biogas, biomass, solar, and wind	CO_2	**21%**
Wastewater Treatment Alternate	Aerobic treatment, requiring energy-intensive aeration	**ALTERNATE for (2):** Wastewater shall be treated anaerobically in digesters or covered ponds, with captured Methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment	CO_2	**50%**

Compliance Assurance

The BPS for this category shall be enforced through design standards and equipment description.

The following permit condition will apply:

- *In order to minimize Green House Gas emissions and optimize equipment efficiency, all equipment shall be operated in accordance with manufacturer specifications and approved design specifications. [California Environmental Quality Act]*

8. Oil and Gas Extraction, Storage, Transportation and Refining Operations

Illustrative BPS:

Fugitive Methane emissions shall be minimized by applying VOC Leak Standards, as contained in District Rules 4409 and 4455 to components handling methane.

BPS Determination

The proposed BPS for this category represents the most stringent Achieved-in-Practice emission control method and consists of the following element:

Fugitive Methane emissions shall be minimized by applying VOC Leak Standards, as contained in District Rules 4409 and 4455 to components handling methane: These District rules are intended to minimize fugitive VOC emissions from components used in oil and gas extraction, storage, transportation, and refining.

District Rule 4409 applies to components containing or contacting VOC streams at light crude oil production facilities, natural gas production facilities, and natural gas processing facilities. District Rule 4455 applies to components containing or contacting VOC at petroleum refineries, gas liquids processing facilities, and chemical plants.

The components affected include valves, fittings, threaded connections, pumps, compressors, pressure relief devices, pipes, polished rod stuffing boxes, flanges, process drains, sealing mechanisms, hatches, sight-glasses, meters or seal fluid systems in VOC service.

The rules set leak standards ranging from 200 ppmv to 10,000 ppmv, depending on the type of component, as well as inspection and monitoring standards for all components.

Since the primary purpose of these rules is to control VOC emissions, they do not apply to components at oil production facilities and gas production facilities exclusively handling gas/vapor or liquid with a VOC content of 10% by weight or less; or components at natural gas processing facilities exclusively handing gas/vapor or liquid with a VOC content less than one 1% by weight. The rules also do not apply to components handling commercial grade natural gas.

Thus, the application of these rules to components handling Methane, or those currently exempt because they handle a larger proportion of Methane than VOC, will result in a significant reduction in fugitive Methane emissions. Such an approach therefore can be considered BPS for this category. The method is achieved in practice because the rules are currently being applied to the majority of components, including those with a certain proportion of Methane in their streams.

The District's staff report for rules 4409 and 4455 found that the implementation of these rules with stricter leak standards and increased inspection and monitoring requirements will results in a 60.2% reduction in fugitive VOC emissions. The proposed BPS assumes that a similar reduction in fugitive Methane emissions will be realized by application of the same strict leak, inspection and monitoring standards.

The California Air Resources Board (ARB) is due to promulgate a regulation in 2010 for the control of fugitive Methane emissions from the oil and gas industry. ARB has indicated that their rule is very likely to follow a similar approach as District Rules 4409 and 4455, by establishing leak standards for various components and setting strict inspection and monitoring requirements.

Summary of BPS and achieved GHG emission reductions:

BPS for: Oil and Gas Extraction, Storage, Transportation and Refining Operations				
Category	**Baseline**	**BPS**	**GHG**	**GHG Emission Reduction (%)**
Oil and gas extraction, storage, transportation and refining	No leak standards or inspection and monitoring requirements for CH4 currently or during baseline period of 2002 - 2004	Fugitive Methane emissions shall be minimized by applying VOC Leak Standards, as contained in District Rules 4409 and 4455 to components handling methane	CH4	**60.2%**

Compliance Assurance

The BPS for this category shall be enforced by a combination of design standards, equipment description and permit conditions.

The following permit conditions will apply:

- *In order to minimize Green House Gas emissions and optimize equipment efficiency, all equipment shall be operated in accordance with manufacturer specifications and approved design specifications. [California Environmental Quality Act]*

- *Oil and Gas Extraction, Storage, Transportation and Refining operations shall apply the leak standards and the inspection and monitoring plans as approved under Rules 4409 and/or 4455 to Methane emissions. [California Environmental Quality Act]*

9. Farming Operations – Livestock Rearing

Illustrative BPS:

All operations shall utilize all three following control measures:

(1) All ruminant animal feed shall include at least 6% cottonseed, or, upon District approval, based on sufficient demonstration that use of cottonseed is not feasible, an equivalent substitute; and,

(2) Manure from animal housing areas for mature cows shall be removed and transferred into appropriate treatment facilities at least four times a day and at least once a day for all other animals; and

(3) Collected manure shall be treated anaerobically in digesters or covered lagoons, designed and operated per NRCS standards, with captured methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment.

<u>BPS Determination</u>

The proposed BPS for this category represents the most stringent Achieved-in-Practice emission control methods and consists of the following three elements:

1. All ruminant animal feed shall include at least 6% cottonseed, or, upon District approval, based on sufficient demonstration that use of cottonseed is not feasible, an equivalent substitute: Ruminant animals such as cows and goats produce Methane from the first stomach, known as the rumen, where fermentation of animal matter is carried out by microbes. The methane is emitted through the mouth when the animal burps.

   Diet management is one of the achieved-in-practice methods that can be used to reduce Methane emissions from the rumen. Since Methane is a byproduct of the fermentation of crude plant matter, a diet that incorporates nutrient concentrates and simple sugars and limits crude plant matter will result in less Methane emissions. However, there is no reliable scientific research or data quantifying the reductions of Methane from such diets or providing specific formulas in a manner that could facilitate enforcement or monitoring.

The District was however been able to find credible scientific studies that demonstrated that a significant amount of Methane reductions, ranging from 12% to 36%, can be achieved by incorporating dietary oils such as cottonseed into ruminant animals' diets. Beauchmin et al. (2007)15 reported Methane reductions of up to 36% by feeding 6% cottonseed, while Grainger et al. (2007)16 reported a 12% Methane reduction. The District will use the more conservative 12% reduction reported by Grainger at this time.

2. Manure from animal housing areas (mature cows) shall be removed and transferred into appropriate treatment facilities at least four times a day and at least once a day for all other animals: The primary purpose of frequent removal of manure from the animal housing areas is to reduce VOC emissions from the decomposition of fresh manure. However, based on a news alert issued by Science for Environment Policy, frequent removal of manure from the housing areas has also been found to reduce GHG emissions by up to 7.1%[17]**.** Due to other requirements such as BACT and BARCT, livestock operations that are subject to District permit requirements are usually required to clean animal housing areas at least two to four times a day. It is therefore likely that GHG emission reductions will be higher for such facilities, but in order to be conservative, the District will assume only a 7.1% reduction for all facilities.

3. Collected manure shall be treated anaerobically in digesters or covered lagoons, designed and operated per NRCS standards, with captured methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment: Anaerobic treatment is the process in which Methanogenic microbes decompose or digest organic compounds in manure, in the absence of Oxygen, and produce Methane, Carbon Dioxide and water as by products. Anaerobic decomposition of manure

[15] Beauchemin, K.A., Kreuzer, M., O'Mara, F., and McAllister, T.A. (2008). "Nutritional management for enteric methane abatement: a review.", Australian Journal of Experimental Agriculture, 48(1-2), pp. 21-27. DOI: 10.1071/EA07199.

[16] Grainger, C., Clarke, T., Beauchemin, K.A., McGinn, S.M., and Eckard, R.J. (2008). "Supplementation with whole cottonseed reduces methane emissions and can profitably increase milk production of dairy cows offered a forage and cereal grain diet.", Australian Journal of Experimental Agriculture, 48(1-2), pp. 73-76. DOI: 10.1071/EA07224.

[17] http://ec.europa.eu/environment/integration/research/newsalert/pdf/49na1.pdf

occurs naturally in many parts of livestock operations such as open corrals. When manure decomposes naturally, Methane is released into the atmosphere as fugitive emissions.

A critical strategy for the reduction of such fugitive Methane emissions is to collect as much of the manure as possible and subject it to anaerobic decomposition in a controlled device such as a digester or covered lagoon. The Methane emitted from such a treatment device is easily captured and used for energy recovery to displace the use of fossil fuels and to convert it to Carbon Dioxide, which has a much lower global warming potential.

In most typical livestock operations such as dairies, it is feasible to collect, on average, approximately 71% of the manure by designing the animal housing and feeding areas so that most of the manure is deposited on paved lanes that can be flushed or vacuumed. Methane produced from the collected manure can be captured with an estimated effectiveness of 95%.

The captured methane will be used for energy recovery in a manner that will displace the use of non-renewable fossil fuels and will also not significantly increase criteria pollutants such as NOx. The capture methane can be utilized, but not limited to, injection into the natural gas pipeline, or powering mobile equipment such as farm trucks. It is estimated that combustion of biomethane for energy recovery will convert up to 99% of the Methane into Carbon Dioxide. Taking the effect of the CO_2 produced from the combustion of CH4 into account, an overall reduction of 63.5% of fugitive CH4 emissions can be achieved by the use of properly designed and controlled anaerobic treatment as a BPS.

The expected reduction is calculated as follows:

Percentage of Methane reduced = [Percentage of manure collected into digester x percentage of methane captured from digester x percentage of methane converted to CO_2] – [methane equivalent of CO_2 produced, as a percentage of methane combusted]
= [71% x 95% x 99%] – [71% x 95% x 99%]/21
= 66.7% - 3.2%
= 63.5%.

The use of bio-methane to displace gasoline results in a 25.2% reduction in CO_2 emissions, as discussed below, assuming compressed bio-methane to be in all respects similar to compressed natural gas:

According to the California Climate Action Registry General Reporting Protocol (Carbon Dioxide Emission Factors for Transport Fuels, Page 94**),** gasoline emits 8.81 kg CO_2 per gallon, while compressed natural gas emits 5.31 Kg CO_2 per Therm.

1 Therm = 100,000 Btu
Energy content of 1 gallon of gasoline = 124,000 Btu

Adjusting the gasoline CO_2 emission factor to 100,000 Btu, (8.81/1.24) = 7.10 Kg CO_2 per Therm.

Reduction in CO_2 = 7.10 – 5.31 = 1.79
% reduction = 1.79/7.10 x 100 = 25.2%

The use of captured methane to displace diesel results in a 27.3% reduction in CO_2 emissions, as discussed below, assuming compressed bio-methane to be in all respects similar to compressed natural gas:

According to the California Climate Action Registry General Reporting Protocol (Carbon Dioxide Emission Factors for Transport Fuels, Page 94**),** diesel emits 10.15 kg CO_2 per gallon, while compressed natural gas emits 5.31 Kg CO_2 per Therm.

1 Therm = 100,000 Btu
Energy content of 1 gallon of diesel = 139,000 Btu

Adjusting the diesel CO_2 emission factor to 100,000 Btu, (10.15/1.39) = 7.30 Kg CO_2 per Therm.

Reduction in CO_2 = 7.30 – 5.31 = 1.99
% reduction = 1.99/7.30 x 100 = 27.3%

The baseline emissions for the livestock operations can be assumed to be the same as the 2002 – 2004 used by the AB32 Scoping Plan, since livestock operations have not changed much since that period. Although permit requirements for many livestock farms took effect in 2004, the particular BPS proposed, with the exception of frequent manure removal from livestock housing areas, have never been implemented as mandatory permit requirements. Instead, many other control measures aimed at reducing VOC and PM10 emissions have been applied with greater emphasis.

Summary of BPS and achieved GHG emission reductions:

BPS for: Farming Operations - Livestock Rearing				
Category	**Baseline**	**BPS**	**GHG**	**GHG Emission Reduction (%)**
Farming Operations - Livestock rearing	Farming operations were not subject to permit regulations until January 1, 2004, hence no enforceable emission reduction requirements were in place during 2 of the 3 baseline years of 2002 to 2004. There is currently no ruminant feed content requirement	(1)All ruminant animal feed shall include at least 6% cottonseed, or, upon District approval, based on sufficient demonstration that use of cottonseed is not feasible, an equivalent substitute; and	CH_4	**12.0%**
		(2) Manure from animal housing areas for mature cows shall be removed and transferred into appropriate treatment facilities at least four times a day and at least once a day for all other animals; and	CH_4	**7.1%**
	Even though removal of manure 4 times a day for mature cows is currently required as BACT, there is no corresponding anaerobic treatment requirement, hence no effect on CH_4	(3) Collected manure shall be treated anaerobically in digesters or covered lagoons, with captured methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment	CH_4	**63.5%**

Compliance Assurance

The BPS for this category shall be enforced by a combination of design standards, equipment description, and permit conditions.

The following conditions will apply:

- *In order to minimize Green House Gas emissions and optimize equipment efficiency, all equipment shall be operated in accordance with manufacturer specifications and approved design specifications. [California Environmental Quality Act]*

- *All ruminant animal feed shall include at least 6% cottonseed. [California Environmental Quality Act]*

- *Manure from animal housing areas shall be removed and transferred into appropriate treatment facilities at least four times a day for mature cows and at least once a day for all other animals. [California Environmental Quality Act]*

10. Farming Operations – Application of Manure to Cropland at Livestock Rearing Operations

Illustrative BPS:

Manure shall be incorporated into soil within 24 hours after application.

BPS Determination
The proposed BPS for this category represents the most stringent Achieved-in-Practice emission control method and consists of the following element:

Manure shall be incorporated into soil within 24 hours after application: The most significant GHG emitted from the application of manure to cropland is Nitrous Oxide (N2O), which has a Global Warming Potential of 310. This gas is emitted as a byproduct when microbes in the soil convert Nitrogen in manure into Nitrates (Nitrification) and also when the reverse process of denitrification, in which Nitrates are converted into Nitrogen, occurs.

One of the most important methods for the reduction of N2O emissions is the reduction of manure and fertilizer applied to cropland. This is because quantity of Nitrogen compounds in the soil, in the form of excess manure or fertilizer that is not taken up by crops, is a major driving factor in the production of N2O. However, there are no scientific studies or data that can be used to determine the proper manure or fertilizer application rates that will minimize excess Nitrogen in the soil. Moreover, due to complications associated with regulating farming operations, it is unlikely that any BPS mandating limits on the use of manure or fertilizer for crop fertilization will be feasible.

Another GHG emitted from the application of manure to cropland is Methane. Methane is naturally present in manure that is decomposing under anoxic conditions, such as manure stored in poorly aerated piles.

In a report entitled *"Recommendations to the San Joaquin valley Air Pollution Control Officer Regarding Best Available Control Technology for Dairies in the San Joaquin Valley*", the Dairy Permitting Advisory Group (DPAG) concluded that VOC emissions could be reduced by 29-58% by the prompt incorporation of manure into soil after application to land. Based on this information, this BPS assumes a similar benefit as far as the reduction of CH4 emissions is concerned. However due to the lack of data, the lower control efficiency of 29% will be used. The BPS assumes that incorporating into soil will allow at least a small percentage of CH4 to be assimilated into other complex organic compounds in the soil instead of being emitted directly into the atmosphere. In addition, certain soil microbes are also able to metabolize CH4 into CO_2, hence reducing total CH4 emissions when incorporation into soil is used.
Manure also produces Carbon Dioxide when it decomposes aerobically upon exposure to air as is the case during land application. Also, as previously discussed, soil incorporated CH4 may be further metabolized into CO_2 by soil microbes. However, there is no BPS that can effectively reduce CO_2 emissions from the application of manure to cropland.

The emissions for land application of manure can be assumed to be the same as emissions occurring during the 2002 – 2004 baseline years used by the AB32 Scoping Plan. Manure application operations have not changed much since that period. Although permit requirements for many farming operations took effect in 2004, the particular BPS proposed has generally not been implemented as mandatory permit requirement. Instead, many other control measures aimed at reducing PM10 emissions have been applied with greater emphasis.

Summary of BPS and achieved GHG emission reductions:

BPS for: Farming Operations – Application of Manure to Cropland				
Category	**Baseline**	**BPS**	**GHG**	**GHG Emission Reduction (%)**
Farming Operations - Land application of manure	Farming operations were not subject to permit regulations until January 1, 2004, hence no enforceable emission reduction requirements were in place during 2 of the 3 baseline years of 2002 to 2004. Incorporation of land applied manure is currently required as BACT, but there is no specific time period within which manure must be incorporated	Manure shall be incorporated into soil within 24 hours after application	CH_4	**29%**

<u>Compliance Assurance</u>

The BPS for this category shall be enforced by permit condition.

The following condition will apply:

- *Manure shall be incorporated into soil within 24 hours after application. [California Environmental Quality Act]*

5.4.3 Best Performance Standards for Development Projects

Introduction

As presented previously in Chapter 1, Figure 1: *California's Greenhouse Gas Emissions by Sector,* the Commercial and Residential sectors represents nine (9) percent of the State's greenhouse gas (GHG) emissions inventory. Greenhouse gas (GHG) emissions from development projects result from operational and transportation related activities. GHG emissions from operational activities are dominated by energy consumed for space and water heating, lighting, and operation of electrical appliances. GHG emissions from transportation activities are dominated by consumption of gasoline and diesel for movement of goods and people.

In characterizing GHG emissions from the Commercial and Residential sectors, the 1990 emissions set by the California Air Resources Board (ARB) are based on fuel use activities which comprise more than 80 percent of the overall 1990 statewide greenhouse gas emissions. The forecasted 2020 business-as-usual emissions developed by ARB considered GHG emissions contributions resulting from energy consumption only (e.g.: natural gas, distillate, wood, and diesel)[18]. Thus, reducing GHG emissions from these sectors has significant overlap with energy efficiency and conservation measures (E-1 and CR-1) addressed in ARB's *Climate Change Proposed Scoping Plan*-Electricity Generation sector that was adopted by ARB's Board in December 2008.

5.4.3.1 GHG Emissions and Reduction Measures

5.4.3.1.1 Energy Efficiency and Conservation

The Electricity Generation sector overlaps and intercepts many of the GHG sectors identified by ARB. Generating electricity consumes about half of all natural gas in the state, making electricity production the single largest consumer of natural gas. The Residential sector consumes another 22 percent of the state's total natural gas consumption; 88 percent of which is used for space and water heating[19]. Comprising 23 percent of the state's total GHG emissions, the Electricity Generation sector is

[18] *Staff report – California 1990 Greenhouse Gas Emissions Level and 2020 Emissions Limit.* California Air Resources Board, November 16, 2007
[19] *Integrated Energy Policy Report, 2007 Summary,* P.18. California Energy Commission.

California's second largest source of GHG emissions. The Transportation sector is number one, responsible for 38 percent of the State's GHG emissions.

Strategies for reducing GHG emissions from the Electricity Generation sector include reducing the amount of energy consumed and reducing GHG emissions resulting from electricity production. Of these two strategies, the California Energy Commissions (CEC) has determined that reducing GHG emissions depends largely on the success of California's energy efficiency and renewable energy programs[20]. The importance of increasing energy efficiency is mirrored by ARB's determination that increasing energy efficiency will be California's most effective tool for achieving GHG reductions in the Electricity Generation sector[21].

Existing progressive green building standards provide a starting point for performance standards. Existing green building rating systems like LEED (Leadership in Energy and Environmental Design), the California Green Building Code, and others, contain examples of measures that are likely to result in substantial GHG emission reductions from residential and commercial projects.

As presented below in Table 2, ARB has proposed 12 strategies for maximizing energy efficiency, four of which are based on further development of the State's building and appliance energy efficiency codes and standards.

[20] *Integrated Energy Policy Report, 2007 Summary,* P.6. California Energy Commission.
[21] *Climate Change Proposed Scoping Plan Appendices; Vol. I, Electricity and Natural Gas.* P.C-87. California Air Resources Board, October 2008

Table 2- Twelve Strategies for Maximizing Energy Efficiency[22]

• **Cross-cutting Strategy for Buildings**
o "Zero Net Energy" Buildings
• **Codes and Standards Strategies**
o More stringent building codes and appliance standards
o Broader standards for new types of appliances and for water efficiency
o Improved compliance and enforcement for existing standards
o Voluntary efficiency and green building targets beyond mandatory codes
• **Strategies for Existing Buildings**
o Voluntary and mandatory whole-building retrofits for existing buildings
o Innovated financing to overcome first-cost and split incentives for energy efficiency, on-site renewables, and high efficiency distributed generation
• **Existing and Improved Utility Program Strategies**
o More aggressive utility programs to achieve long-term savings
• **Other Needed Strategies**
o Water system and water use efficiency and conservation measures
o Local government programs that lead by example and tap local authority over planning, development, and code compliance
o Additional industrial and agricultural efficiency efforts
o Providing real time energy information to help customers conserve
o and optimize energy performance

5.4.3.1.2 Building and Appliance Standards

Under California Public Resources Code, the CEC is authorized to adopt and update Building Efficiency Standards and Appliance Efficiency Regulation. Building standards include both prescriptive and performance standards for new construction, and for alterations and additions to existing buildings. The standards include pre-defined performance levels for various building components and energy consumption. Examples of such standards are new Cool Roof requirements, mechanical ventilation requirements, compliance option

[22] *Climate Change Proposed Scoping Plan Appendices*; Vol. I, Electricity and Natural Gas. P.C-100. California Air Resources Board, October 2008

credits for distributed energy storage, and calculation of Time Dependent Valuation energy.

Because most of California's older buildings were built to lesser or non-existent building efficiency standards, improving the energy efficiency of existing residential and commercial buildings in California could produce substantial GHG benefits. In fact, improving the efficiency of California's existing building stocks is the single most important activity to reduced GHG emissions within the electricity and natural gas sectors[23]. New standards will become in effect in August 2009.

California's Appliance Efficiency Regulations include standards for both federally and non-federally regulated appliances. The standards apply to appliances sold or offered for sale in California, with a few exceptions. Appliance standards improve the operation and efficiency of refrigerators, freezers, air conditioners and other appliances. Normally, the CEC updates building standards on a three-year cycle. The most recent update occurred in 2008, and several updates are expected to occur between now and 2020[24]. As with building standards, the CEC establishes appliance standards at its discretion. The most recent update occurred in 2007, and several updates are expected to occur between now and 2020[25].

As presented in ARB's Scoping Plan, the California Public Utilities Commission working with the CEC, California's Invester owned utilities (IOUs) and numerous stakeholders, prepared the Long Term Energy Efficiency Strategic Plan. This long-term plan recommends strategies that can enable the utilities and other factors to achieve energy efficiency goals for the 2009-2020 period and beyond, contributing ignorantly to the State's AB 32 goals. Two targets adopted by the CPUC, and supported by the CEC, are as follows:

1. By 2020, all new residential buildings will be zero net energy; and
2. By 2030, all new commercial buildings will be zero net energy[26].

Zero net energy building, which is yet to be defined by energy agencies, would be those that are very energy efficient and generate

[23] *Climate Change Proposed Scoping Plan Appendices*; Vol. I, Electricity and Natural Gas. P.C-108. California Air Resources Board, October 2008

[24] *Climate Change Proposed Scoping Plan Appendices*; Vol. I, Electricity and Natural Gas. P.C-104. California Air Resources Board, October 2008

[25] *Climate Change Proposed Scoping Plan Appendices*; Vol. I, Electricity and Natural Gas. P.C-104. California Air Resources Board, October 2008

[26] *Climate Change Proposed Scoping Plan Appendices*; Vol. I, Electricity and Natural Gas. P.C-112. California Air Resources Board, October 2008

enough energy on-site to completely offset the energy consumed within the building over the course of a year.

5.4.3.1.3 Green Building Strategy

"Green buildings" are designed, built, operated, renovated, and maintained using an integrated approach that creates and ensures a healthy and comfortable environment while maximizing energy and resource efficiencies[27]. As concluded by ARB, the design, construction, demolition, renovation, maintenance and operation of buildings together account for considerable electricity, and natural gas demand. Water usage and waste generation further contributes to GHG emissions. Mining, harvesting, processing, and transportation of building materials used in construction, and products used in the operation of buildings, accounts for further GHG emissions. The choice of where buildings are sited and how they are integrated within communities also affects transportation patterns and infrastructure needs resulting in potentially significant GHG impacts. The *Climate Change Proposed Scoping Plan* (adopted by ARB Board in December 2008) includes a Green Building Strategy that when implemented will further reduce GHG emissions from both existing and new buildings.

5.4.3.1.4 Vehicle Use

GHG emission from vehicle use is the other factor contributing to GHG emissions from development projects and overlap with emission reductions targeted by ARB under the Transportation sector of the *Climate Change Proposed Scoping Plan*. As determined by ARB, the Transportation sector is responsible for 38 percent of the State's GHG emissions. ARB has established three overarching strategies for reducing GHG emissions from vehicle use: more efficient vehicles, lower-carbon fuels, and reduction in vehicle miles traveled (VMT)[28]. ARB has stated that these strategies will be achieved through regulations, market mechanisms, and land use policy. ARB's recommended actions to reduce GHG emissions from the Transportation sector are listed below in Table 3.

[27] *Climate Change Proposed Scoping Plan Appendices*; Vol. I, Electricity and Natural Gas. P.C-138. California Air Resources Board, October 2008

[28] *Climate Change Proposed Scoping Plan Appendices*; Vol. I, Transportation. P.C-55. California Air Resources Board, October 2008

Table 3: Actions for Reducing Transportation GHG Emissions[29]

• California Cap-and-Trade Program linked to the Western Climate Initiative

• Goods Movement Efficiency Measures
• Heavy-Duty Vehicle GHG Emission Reduction – Aerodynamic Efficiency
• Medium- and Heavy-Duty Vehicle Hybridization
• Regional Transportation-Related Greenhouse Gas Targets
• High Speed Rail

5.4.3.1.5 Regional Transportation-Related Greenhouse Gas Targets[30]

Transportation planning is done on a regional level in major urban areas, reflecting local land use patterns and decisions. Through regional planning efforts, such as the "Blueprint" planning model, regions can select future growth scenarios that lead to more environmentally and economically sustainable and energy efficient communities. Senate Bill 375 (SB 375) (Steinberg, Chapter 728, Statues of 2008) establishes mechanisms for the development of regional GHG reduction targets for passenger vehicle. Under SB 375, ARB is required to develop, in consultation with metropolitan planning organizations (MPOs) passenger vehicle GHG reduction targets for 2020 and 2035. The bill creates incentives for local governments and developers by providing relief from certain CEQA requirements for development projects that are consistent with regional plans that achieve the GHG reduction targets.

5.4.3.1.6 GHG Baseline & Business as Usual Emissions

ARB estimated the statewide 1990 greenhouse gas emissions level of 427 MMT CO_2E based on data from State and federal agencies, international organizations, and California industries. Upon approval by

[29] *Climate Change Proposed Scoping Plan Appendices*; Vol. I, Transportation. P.C-55. California Air Resources Board, October 2008
[30] *Climate Change Proposed Scoping Plan Appendices*; Vol. I, Transportation. P.C-75. California Air Resources Board, October 2008

ARB's Board in December 2007, the 1990 emissions level became the 2020 emissions limit, which represents an aggregated emissions limit for California. The gross statewide emissions in 1990 were 433 MMT CO_2E with forestry sinks offsetting approximately 7 MMT CO_2E, resulting in net emissions to the atmosphere of approximately 427 MMT CO_2E. The 1990 emissions level is a compilation or inventory of the amount and type of greenhouse gases emitted by different sources on an annual basis[31]. The resulting 2020 BAU estimates of 596 MMT CO_2E are compared to the 1990 level target for 2020 of 427 MMT CO_2E in yr 1990 to determine the total statewide GHG reductions needed which is 169 MMT CO_2E or approximately 30% reduction.

The California Air Resources Board (ARB) forecasting approach for BAU greenhouse gas emissions in 2020 uses emissions estimates from 2002 through 2004 to develop baseline GHG emissions from which to grow emissions into the future[32]. The 3-year average baseline emissions estimate of 2002-2004 includes emissions from older, less energy efficient structures and emissions from structures built to comply with building and appliance standards in effect during the baseline years. Based on the GHG emissions ARB determined, in order to achieve the GHG reduction targets established in AB 32 development projects after 2004 would need to reduce GHG emissions by about 10% from the 1990 emissions and for all sectors altogether by about 30% from BAU emissions as projected for 2020.

5.4.3.1.7 Achieved GHG Emission Reductions

Building and appliance standards are critical tools in reducing energy demand. During the baseline years of 2002-2004, all new construction was required to comply with building standards adopted in 2001. Building and Appliance standards have been revised since 2004. Each successive version of the building and appliance standards requires new technologies and tighter performance standards, thus, reducing GHG emissions from new development projects, as well as reducing emissions from renovation of older structures[33]. The building standards were updated in 2005 and new 2008 standards have been published that take effect in 2009. The 2009 standards contain numerous

[31] *Business-as-Usual Forecasting Method Summary,* P. 1. California Air Resources Board, July 30, 2008

[32] *California 1990 Greenhouse Gas Emissions Level and 2020 Emissions Limit;* P. 2. California Air Resources Board, November 16, 2007

[33] *Climate Change Proposed Scoping Plan Appendices; Vol. I, Electricity and Natural Gas.* P.C-104. California Air Resources Board, October 2008

requirements for improving energy efficiency in both residential and non-residential structures. The appliance standards were updated in 2003, 2005 and again in 2006, with further updates planned. Thus, it is reasonable to conclude that new development projects occurring after 2004 are already implementing measures that reduce GHG emissions below the 2002-2004 emissions.

As presented below in Tables 4 and 5, preliminary estimates by the District show that 2007 residential use of natural gas is about 20% less than the 2002-2004 baseline period. Reducing natural gas consumption should result in a concomitant reduction in GHG emissions. Thus, these data suggest that new residential developments may already be emitting less GHG emissions than the 2002-2004 baseline period. CEC also has data demonstrating that although the number of residential customers have increased, the average household use has been reduced as a result of the appliance and building energy efficiency standards[34].

Emission reduction targets established by ARB are based on average fuel consumption for the baseline year. Therefore, emission reductions occurring after the baseline year should be credited towards the achieving the required percent reduction. The District recognizes that this apparent reduction may be influenced by other factors other than building and appliance standards and that commercial development may not have experienced equivalent reductions. Before finalizing its determination, the District will conduct a more detailed analysis of development project energy consumption and associated emission reductions.

Table 4: 2002-2004 Per capita GHG Emissions from natural gas - Residential

	CA MTCO2[1]	SJV MTCO2	SJV average household[2]	MTCO2 per Dwelling Unit
Residential	26.87	2.821	1,161,751.00	0.0000024

5.4.4 Energy Efficiency and Land Use Planning

As previously discussed, GHG emissions from commercial and residential develop are dominated by building and appliance energy efficiencies and GHG emissions resulting from movement of goods and people. Thus, there is considerable overlap between Commercial and Residential sectors and the Electricity Generation and Transportation Sectors.

In developing its recommendations for approved GHG emission reduction measures for development projects, the District considered the extent to which development projects will be subject to GHG emission reduction requirements imposed by ARB and other state agencies with statutory authority for reducing GHG emissions from development projects. Additionally, the District considered GHG emission reductions that have already been achieved as a result of changes to the building and appliance standards adopted by the CEC after the 2002-2004 baseline period.

5.4.4.1 Energy Efficiency and Conservation GHG Emission Reduction Measures

As previously discussed, the CEC has statutory authority for establishing performance standards for building and appliance efficiencies. California's per capita electricity use has stayed flat for the past 30 years because of efficiency standards and utility efficiency programs[35].

The California Public Utilities Commission and the California Energy Commission provided their recommendations to ARB on strategies for reducing GHG emissions in the electricity and natural gas sectors[36]. Included in their evaluations for potential areas of GHG emissions

[35] *Integrated Energy Policy Report 2007 Summary*. California Energy Commission. 2007
[36] *Final Opinion and Recommendations on Greenhouse Gas regulatory Strategies.* CA Energy Commission & CA public Utilities Commissions, October 2008

reductions is the energy efficiency through codes and standards. The CEC has set the 2008 standards for building energy efficiency standards which are to be in effect as of January 1, 2010.

The CEC and the Climate Action Team Energy Subgroup have the necessary expertise and statutory authority for establishing performance standard for building and appliance standards. The CEC and Climate Change Action Team Energy Subgroup have already done outstanding research and brought forth recommendations to ARB. The measures or areas identified for the energy sector are already those that would bring the majority of the reductions and already reflect the best practices in energy efficiency.

The District concludes that for commercial and residential developments, compliance with building and appliance standards established by CEC reduces project specific GHG emissions and thus, constitutes a valid GHG emission reduction measure for energy efficiency and conservation.

5.4.4.2 Land Use Planning GHG Emission Reduction Measures

Reducing vehicular emissions from commercial and residential developments overlap emission reductions targeted by ARB under the Transportation sector of the *Climate Change Proposed Scoping Plan*. ARB has established three overarching strategies for reducing GHG emissions from vehicle use: more efficient vehicles, lower-carbon fuels, and reduction in vehicle miles traveled (VMT). Local governments have the ability to directly influence both siting and design of new residential and commercial developments in a way that reduces vehicle miles traveled (VMT). Reductions in VMT can be achieved through diversified land use patterns that provide people greater access to alternative forms of transportation, including transit, biking and walking. Reductions in VMT can be achieved through diversified land use patterns where people can live, work, and play without having to drive great distances. Land use planning that reduces VMT can also reduce the GHG emissions by reducing land consumption, energy use, water use, and waste.

Potential reductions in GHG emissions from land use planning are established through Senate Bill 375 (SB375). The bill focuses on housing and transportation planning decisions to reduce fossil fuel consumption and conserve farmlands and habitat. It allows an opportunity to provide incentives to locate housing developments closer to where people work and go to school, allowing them to reduce vehicle miles traveled every year. SB375 integrates AB 32's goal to reduce GHG emissions into transportation planning by requiring that a sustainable communities strategy be added to the regional transportation Plan. SB 375 also directs ARB to work with California's Metropolitan Planning Organizations to align their regional transportation, housing and land-use plans and prepare a "sustainable communities strategy" to reduce the amount of vehicle miles traveled in their respective regions and demonstrate the region's ability to attain its greenhouse gas reduction targets to be achieved from the automobile and light truck sectors for 2020 and 2035. When it is determined that the SCS cannot achieve the targets, the Metropolitan Planning Organization The must develop an Alternative Planning Strategy.

Per guidance provided by OPR, CEQA authorizes reliance on previously approved plans and mitigation programs that have adequately analyzed and mitigated GHG emissions to a less than significant level.

5.4.5 Illustrative GHG Emission Reduction Measures for Development Projects

Both GHG and criteria pollutant emissions from development projects are direct results of energy consumption and vehicle miles traveled. Land use decisions that would impact GHG emissions are the same land use decisions that would impact criteria pollutant emissions from development projects. The District, through implementation of District Rule 9510 (Indirect Source Review) has considerable experience with evaluating criteria pollutant emissions from development projects, and evaluating the mitigating effects of project design elements.

Any combination of approved GHG emissions reduction measures achieving a combined 29% of GHG emissions compared to the established Baseline GHG emissions factor per unit of activity is considered **Best Performance Standard** (BPS) for the respective type of development project. Projects achieving a 29% reduction in GHG emissions would be determined to have a less than significant individual and cumulative impact for GHG emissions. To be considered to have a less than significant individual and cumulative impact for GHG emissions, projects not achieving a 29% reduction would require quantification of GHG emissions and demonstration that GHG emissions have been reduced or mitigated by 29%, including GHG emission reductions achieved since the 2002-2004 baseline.

The following discussion illustrates possible GHG emission reduction measure, as presented in Appendix J, for development projects (residential, commercial and industrial) and provides the basis and/or rationale for each, as well as an assessment of potential GHG emissions reduction impact relative to a 2002-2004 emissions inventory baseline. It should be noted that these examples of BPS are for illustrative purposes only, and should not be used by any lead agency as District-approved or sanctioned standards. As discussed further in this staff report, the proposed process of establishing BPS provides opportunity for public input into the development of BPS.

To simplify the evaluation process, the District will develop a point system and tools for use by lead agencies to score the effectiveness of the achieved BPS. An important effort that will contribute to the establishment of GHG Emission Reduction Measures for development projects is the ongoing work by the California Air Pollution Control Officers Association (CAPCOA) to identify and quantify control efficiencies for development mitigation measures reducing GHG and criteria pollutant emissions. The District is an active participant in the CAPCOA effort.

The illustrative GHG Emission Reduction Measures table lists the mitigation measures that relate to bicycle/pedestrian use, transit, parking, commercial and residential development design, building design, and commuting (See Appendix J). Each measure has been assigned a land use type for which a point value in reduction may be claimed. The point values are used to quantify the approximate emission reduction factor associated with a particular mitigation measure. The land use types include residential (R), commercial (C), and mixed-used (M). Each point associated with a particular measure is equivalent to an equal percentage of emission reductions. For example, implementing mitigation measures in a project that adds up to 15 mitigation points means that the measures are anticipated to achieve a 15% reduction in project related GHG operational emissions. The demonstrated GHG emission reductions would be added to the GHG emission reductions achieved since the 2002-2004 baseline.

BICYCLE/PEDESTRIAN/TRANSIT MEASURES

1. Bike Parking Measure *- Commercial, Mixed-Use*

Measure Description
Non-residential projects provide plentiful short-term and long-term bicycle parking facilities to meet peak season maximum demand. Short term facilities are provided at a minimum ratio of one bike rack space per 20 vehicle spaces. Long-term facilities provide a minimum ratio of one long-term bicycle storage space per 20 employee parking spaces.

Reduction Methodology & Source[37]
As a rule of thumb, the Center for Clean Air Policy (CCAP) guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 1/4 of that for this measure alone. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is 0.625%.

[37] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

2. End of Trip Facilities Measure - *Commercial, Mixed-Use*

Measure Description

Non-residential projects provide "end-of-trip" facilities including showers, lockers, and changing space. Facilities shall be provided in the following ratio: four clothes lockers and one shower provided for every 80 employee parking spaces. For projects with 160 or more employee parking spaces, separate facilities are required for each gender.

Reduction Methodology & Source[38]

The Transportation Demand Management (TDM) Encyclopedia allows a 2-5% reduction for worksite showers ad lockers. The CCAP guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 1/4 of that for this measure alone. Source: TDM Encyclopedia May 11, 2006; CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 0.625%.

3. Bike Parking at Multi-Unit Residential Measure - *Residential*

Measure Description

Long-term bicycle parking is provided at apartment complexes or condominiums without garages. Project provides one long-term bicycle parking space for each unit without a garage. Long-term facilities shall consist of one of the following: a bicycle locker, a locked room with standard racks and access limited to bicyclists only, or a standard rack in a location that is staffed and/or monitored by video surveillance 24 hours per day.

Reduction Methodology & Source[39]

As a rule of thumb, the CCAP guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 25% of that for this measure

[39] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

alone. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 0.625%.

4. Proximity to Bike Path/Bike Lanes Measure - *Commercial, Mixed-Use, Residential*

Measure Description

Entire project is located within 1/2 mile of an existing Class I or Class II bike lane and project design includes a comparable network that connects the project uses to the existing offsite facility. Existing facilities are defined as those facilities that are physically constructed and ready for use prior to the first 20% of the projects occupancy permits being granted. Project design includes a designated bicycle route connecting all units, on-site bicycle parking facilities, offsite bicycle facilities, site entrances, and primary building entrances to existing Class I or Class II bike lane(s) within 1/2 mile. Bicycle route connects to all streets contiguous with project site. Bicycle route has minimum conflicts with automobile parking and circulation facilities. All streets internal to the project wider than 75 feet have class II bicycle lanes on both sides.

Reduction Methodology & Source[40]

As a rule of thumb, the CCAP guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 1/4 of that for this measure alone. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 0.625%.

[40] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

5. Pedestrian Network Measure - *Commercial, Mixed-Use, Residential*

Measure Description

The project provides a pedestrian access network that internally links all uses and connects to existing external streets and pedestrian facilities. Existing facilities are defined as those facilities that are physically constructed and ready for use prior to the first 20% of the projects occupancy permits being granted. The project provides a pedestrian access network that internally links all uses for connecting to planned external streets and pedestrian facilities (facilities must be included pedestrian master plan or equivalent).

Reduction Methodology & Source[41]

Because this measure also eliminates physical barriers between residential and non-residential uses that impede bicycle or pedestrian circulation, this measure is similar in nature to 6. As cited in the TIAX report, the CCAP guidebook attributes a 1% reduction in VMT. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is between 0.5% and 1.0%.

6. Pedestrian Barriers Minimized - *Commercial, Mixed-Use, Residential*

Measure Description

Site design and building placement minimize barriers to pedestrian access and interconnectivity. Physical barriers such as walls, berms, landscaping, and slopes between residential and non-residential uses that impede bicycle or pedestrian circulation are eliminated. Barriers to pedestrian access of neighboring facilities and sites are minimized. This measure is not meant to prevent the limited use of barriers to ensure public safety by prohibiting access to hazardous areas, etc..

Reduction Methodology & Source[42]

The reduction is based on the TIAX report, which indicates a 1% reduction, and the CCAP report, which attributes a 1% to 5% reduction. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

Achieved GHG Emission Reductions

[41] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

[42] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

With this measure the estimated achieved GHG emission reduction is 1.0%.

7. Bus Shelter for "existing" Transit Service Measure - *Commercial, Mixed-Use, Residential*

Measure Description

Bus or Streetcar service provides headways of one hour or less for stops within 1/4 mile; project provides safe and convenient bicycle/pedestrian access to transit stop(s) and provides essential transit stop improvements (i.e., shelters, route information, benches, and lighting).

Reduction Methodology & Source[43]

This reduction is based on the assumption that the measure applies to providing bus stop route information & benches. Emission reductions are based on conclusion obtained from the TIAX report and the CCAP guidebook. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 0.5%.

8. Bus Shelter for "planned" Transit Service - *Commercial, Mixed-Use, Residential*

Measure Description

Project provides transit stops with safe and convenient bicycle/pedestrian access. Project provides essential transit stop improvements (i.e., shelters, route information, benches, and lighting) in anticipation of future transit service. If measure *7 is selected, it excludes this measure.*

Reduction Methodology & Source[44]

This reduction is based on the assumption that the measure applies to providing bus stop route information & benches. Emission reductions are based on conclusion obtained from the TIAX report and the CCAP guidebook. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

Achieved GHG Emission Reductions

---

[43] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

[44] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

With this measure the estimated achieved GHG emission reduction is 0.25%.

9. Traffic Calming Measure - *Commercial, Mixed-Use, Residential*

Measure Description
Project design includes pedestrian/bicycle safety and traffic calming measures in excess of jurisdiction requirements. Roadways are designed to reduce motor vehicle speeds and encourage pedestrian and bicycle trips by featuring traffic calming measures. Traffic calming measures include: bike lanes, center islands, closures (cul-de-sacs), diverters, education, forced turn lanes, roundabouts, speed humps, etc.

Reduction Methodology & Source[45]
SMAQMD appears to have the best information available as reflected in their Guidance for Land Use Emission Reductions, which allocates reductions by the percent of intersections with traffic calming improvements as indicated in the table below. We were unable to locate more specific information. Source: Draft Update to SMAQMD Guidance for Land Use Emission Reductions.

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is between 0.25% and 1.0%. *(See Table in Appendix J)*

45 *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

PARKING MEASURES

10. Paid Parking - *Commercial, Mixed-Use, Residential*

10.1 Paid Parking: Urban Site within ¼ mile from transit stop-

Measure Description
Employee and/or customer paid parking system. Daily charge for parking must be equal to or greater than the cost of a local transit pass + 20%. Monthly charge for parking must be equal to or greater than the cost of a local monthly transit pass, plus 20%.

Reduction Methodology & Source[46]
Shoupe, 2005. Parking Cash Out. [$5/day reduces drive-alone share by 21% for commuters to downtown LA, with elasticity of -0.18 (e.g., if price increases 10%, then solo driving goes down by 1.8% more (Wilson 1991)] [Reported 1-10% reduction in trips to central city sites, and 2-4% in suburban sites (Urban Institute)]. The District has used a conservative number for this approach.

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is 5.0%.

10.2 Paid Parking: Urban Site greater than ¼ mile from transit stop-

Measure Description
Employee and/or customer paid parking system. Daily charge for parking must be equal to or greater than the cost of a local transit pass + 20%. Monthly charge for parking must be equal to or greater than the cost of a local monthly transit pass, plus 20%.

[46] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

Reduction Methodology & Source[47]
Shoupe, 2005. Parking Cash Out. [$5/day reduces drive-alone share by 21% for commuters to downtown LA, with elasticity of -0.18 (e.g., if price increases 10%, then solo driving goes down by 1.8% more (Wilson 1991)] [Reported 1-10% reduction in trips to central city sites, and 2-4% in suburban sites (Urban Institute)]. The District has used a conservative number for this approach.

Achieved GHG Emission Reductions
With this measure the estimated GHG achieved emission reduction is 1.5%.

10.3 Paid Parking: Suburban site within 1/4 mile of transit stop

Measure Description
Employee and/or customer paid parking system. Daily charge for parking must be equal to or greater than the cost of a local transit pass + 20%. Monthly charge for parking must be equal to or greater than the cost of a local monthly transit pass, plus 20%.

Reduction Methodology & Source[48]
Shoupe, 2005. Parking Cash Out. [$5/day reduces drive-alone share by 21% for commuters to downtown LA, with elasticity of -0.18 (e.g., if price increases 10%, then solo driving goes down by 1.8% more (Wilson 1991)] [Reported 1-10% reduction in trips to central city sites, and 2-4% in suburban sites (Urban Institute)]. The District has used a conservative number for this approach.

Achieved GHG Emission Reductions
With this measure the estimated GHG achieved emission reduction is 2.0%.

10.4 Paid Parking: Suburban site greater than 1/4 mile from transit stop

Measure Description
Employee and/or customer paid parking system. Daily charge for parking must be equal to or greater than the cost of a local transit pass + 20%. Monthly charge for parking must be equal to or greater than the cost of a local monthly transit pass, plus 20%.

[47] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.
[48] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

Reduction Methodology & Source[49]
Shoupe, 2005. Parking Cash Out. [$5/day reduces drive-alone share by 21% for commuters to downtown LA, with elasticity of -0.18 (e.g., if price increases 10%, then solo driving goes down by 1.8% more (Wilson 1991)] [Reported 1-10% reduction in trips to central city sites, and 2-4% in suburban sites (Urban Institute)]. The District has used a conservative number for this approach.

Achieved GHG Emission Reductions
With this measure the estimated GHG achieved emission reduction is 1.0%.

11. Parking Cash Out Measure - *Commercial, Mixed-Use*

Measure Description
Employer provides employees with a choice of forgoing subsidized parking for a cash payment equivalent to the cost of the parking space to the employer.

Reduction Methodology & Source[50]
Shoupe, 2005. Parking Cash Out. [2/3 as effective as charging for parking (8 case studies - chapter 4, 13% reduction in solo driver trips, -12% VMT per employee, and -11% in vehicle trips per commuter)]. The District has used a conservative number for this approach.

Achieved GHG Emission Reductions
With this measure the estimated GHG achieved emission reduction is 0.6%.

12. Minimum Parking - *Commercial, Mixed-Use, Residential*

Measure Description
Provide minimum amount of parking required. Special review of parking required. If zoning codes in the San Joaquin Valley area have provisions that allow a project to build less than the typically mandated amount of parking if the development features design elements that reduce the need for automobile use. This measure recognizes the air quality benefit that results when facilities minimize parking needs, and grants mitigation value to project that implement all available parking reductions. Once land uses are determined, the trip reduction

[49] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.
[50] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

factor associated with this measure can be determined by utilizing the Institute of Transportation Engineers (ITE) Parking generation publication[51]. The reduction in trips can be computed as shown below by the ratio of the difference of minimum parking required by code and ITE peak parking demand to ITE peak parking demand for the land uses multiplied by 50%. The maximum achievable trip reduction is 6%. For projects where retail space occupies 50% or more of the total built space, do not use December specific parking generation rates (from ITE). Percent Trip Reduction = 50*[(min parking required by code - ITE peak parking demand) / (ITE peak parking demand)].

Reduction Methodology & Source[52]
Nelson/Nygaard, 2005. pg. 16. (trip reduction = ((actual parking provision - ITE parking generation rate) / ITE parking generation rate) *0.5). (Note: this formula is not verbatim from that cited in the Nelson/Nygaard document, since the formula provided did not make sense for computing trip reductions. This is what EDAW believes was meant, and this method actually works.) The allowed reduction is the range mid-point.

Achieved GHG Emission Reductions
With this measure the estimated GHG achieved emission reduction is 3.0%.

13. Parking Reduction Beyond Code Measure - *Commercial, Mixed-Use, Residential*

Measure Description
Provide parking reduction less than code. Special review of parking required. Recommend a Shared Parking strategy. Trip reductions associated with parking reductions beyond code shall be computed in the same manner as described under measure 11, as the same methodology applies. The maximum achievable trip reduction is 12%. This measure can be readily implemented through a Shared Parking strategy, wherein parking is utilized jointly among different land uses, buildings, and facilities in an area that experience peak parking needs at different times of day and day of the week. For example, residential uses and/or restaurant/retail uses, which experience peak parking demand during the evening/night and on the weekends, arrange to share parking facilities with office and/or educational uses, which experience peak demand during business hours and during the week.

[51] The ITE Parking Generation Manual (3rd Edition) is available at: http://www.ite.org/tripgen/parking.asp . The ISBN number for this publication is 0-935403-79-5.
[52] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

Reduction Methodology & Source[53]

Nelson/Nygaard, 2005. pg. 16. (trip reduction = ((actual parking provision - ITE parking generation rate) / ITE parking generation rate) *0.5). (Note: this formula is not verbatim from that cited in the Nelson/Nygaard document, since the formula provided did not make sense for computing trip reductions. This is what EDAW believes was meant, and this method actually works.) The allowed reduction is the range mid-point. Trip reduction

Achieved GHG Emission Reductions

With this measure the estimated GHG achieved emission reduction is 6.0%.

14. Pedestrian Pathway through Parking Measure - *Commercial, Mixed-Use, Residential*

Measure Description

Provide a parking lot design that includes clearly marked and shaded pedestrian pathways between transit facilities and building entrances. Pathway must connect to all transit facilities internal or adjacent to project site. Site plan should demonstrate how the pathways are clearly marked, shaded, and are placed between transit facilities and building entrances.

Reduction Methodology & Source[54]

The CCAP guidebook attributes between 1% and 4% reduction from all pedestrian measures. There is no specific information related to providing shaded pedestrian pathways between transit facilities and building entrances. It could be said that providing covered carpool/vanpool spaces near the entrance to the buildings has the similar goal of increasing the comfort of the user while walking to the building entrance. The TIAX report assigns a 1% reduction to the covered carpool measure. Transit usage is most affected by the headway times and the proximity to the destination. Therefore, it would seem reasonable to assume .5% Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by Tax on behalf of SMAQMD.

Achieved GHG Emission Reductions

With this measure the estimated GHG achieved emission reduction is 0.5%.

---

[53] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

[54] Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007. Sacramento Metropolitan Air Quality Management District.

15. Off Street Parking Measure - *Commercial, Mixed-Use, Residential*

Measure Description

For 1.5% reduction, parking facilities shall not be sited adjacent to public roads contiguous with project site. Functioning pedestrian entrances to major site uses are located along street frontage. Parking facilities do not restrict pedestrian, bicycle, or transit access from adjoining uses. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, a description of where parking is located relative to the buildings on the site, site plans, maps, or other graphics, which demonstrate the placement of parking facilities behind on-site buildings relative to streets contiguous with the project site. Surrounding uses should be high density or mixed-use, there shall be other adjoining pedestrian and bicycle connections, such as wide sidewalks and bike lanes, and surrounding uses shall also implement measure 15.

For 1.0% reduction, (parking structures only) proponent must show that parking facilities that face street frontage feature ground floor retail along street frontage. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, a written description of the parking facility and the amount of retail space on the ground floor, site plans, maps, or other graphics demonstrating the placement of retail/commercial space along all street fronts contiguous with parking structure.

For 0.1% reduction, the project is not among high-density or mixed uses, is not connected to pedestrian or bicycle access ways, or is among uses that do not also hide parking. This point value is reflective of the importance that other pedestrian and density measures be in place in order for this measure to be effective.

Reduction Methodology & Source[55]

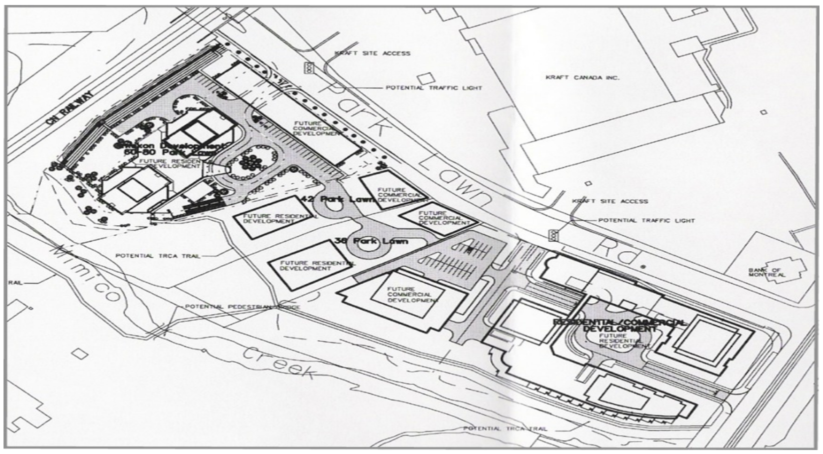
No empirical support for this specific measure; however, range of values is based on other pedestrian-oriented measures. The range recognizes the dependence of this measure on other measures. To be awarded 1.0 points, development must be in an area with density, wide sidewalks, and where other uses are also hiding parking. The efficacy of this measure is reduced to 0.1 if the development does not include other pedestrian and mixed-use measures. Parking structure with ground-floor retail is awarded 0.5.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is between 0.1% and 1.5%.

[55] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

SITE DESIGN MEASURES



16. Office/Mixed-Use Proximate to Transit Measure - *Commercial, Mixed-Use*

Measure Description

Mitigation value is based on project density and proximity to transit. Planned transit must be in MTP or RT Master Plan. To count as "existing transit" service must be fully operational prior to the first 20% of the projects occupancy permits being granted. Project must provide safe and convenient pedestrian and bicycle access to all transit stops within 1/4 mile. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, a written description of how the project complies with the measure, a map or graphic depicting the location of the project in relation to the transit stop. Graphic should demonstrate a 1/4 mile radius, arc, from transit and planned pathways and linkages to the transit stop. Proponent shall also provide graphics depicting the size and layout of the building as well as the calculations demonstrating the FAR (floor to area ratio).

Reduction Methodology & Source[56]
No empirical support for this measure, beyond that provided by SMAQMD in its draft guidance. According to Nelson/Nygaard, 2005, trip generation at the non-residential end is influenced by density to a much lesser degree, so this is fairly consistent with the transit reductions applied in measure 20. Assumes a 30 minute transit schedule.

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is between 0.2% and 1.5%.

17. Orientation toward "existing" transit, bikeway, or pedestrian corridor - *Commercial, Mixed- Use, Residential*

Measure Description
Project is oriented towards existing transit, bicycle, or pedestrian corridor. Setback distance is minimized. Setback distance between project and adjacent uses is reduced to the minimum allowed under jurisdiction code. Setback distance between different buildings on project site is reduced to the minimum allowed under jurisdiction code. Setbacks between project buildings and sidewalks is reduced to the minimum allowed under jurisdiction code. Buildings are oriented towards street frontage. Primary entrances to buildings are located along public street frontage. Project provides bicycle access to existing bicycle corridor. Project provides access to existing pedestrian corridor. (Cannot get points for both this measure and measure 17).

Reduction Methodology & Source[57]
The CCAP guidebook attributes a 0.5% reduction per 1% improvement in transit frequency. Based on a case study presented in the CCAP report, a 10% increase in transit rider ship would result in a 0.5% reduction. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by Tax on behalf of SMAQMD.

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is 0.50%.

[56] Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007. Sacramento Metropolitan Air Quality Management District.
[57] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

18. Orientation toward "planned" transit, bikeway, or pedestrian corridor - *Commercial, Mixed-Use*

Measure Description
Project is oriented towards planned transit, bicycle, or pedestrian corridor. Setback distance is minimized. Planned transit, bicycle or pedestrian corridor must be in the MTP, RT Master Plan, General Plan, or Community Plan. Setback distance between project and existing or planned adjacent uses is minimized or non-existent. Setback distance between different buildings on project site is minimized. Setbacks between project buildings and planned or existing sidewalks are minimized. Buildings are oriented towards existing or planned street frontage. Primary entrances to buildings are located along planned or existing public street frontage. Project provides bicycle access to any planned bicycle corridor(s). Project provides pedestrian access to any planned pedestrian corridor(s).

Reduction Methodology & Source[58]
The CCAP guidebook attributes a 0.5 % reduction per 1% improvement in transit frequency. Based on a case study presented in the CCAP report, a 10% increase in transit rider ship would result in a 0.5% reduction. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by Tax on behalf of SMAQMD.

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is 0.25%.

19. Residential Density Measure - *Residential*

Measure Description
Residential Density with "no transit", project provides high-density residential development. Mitigation value is based on project density with no transit. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area.

Residential Density with "planned" light rail transit, project provides high-density residential development. Mitigation value is based on project density and proximity to planned light rail transit. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area. Transit facilities must be within 1/4 mile of project border. Project

[58] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

provides safe and convenient bicycle/pedestrian access to all transit stop(s) within 1/4 mile of project border. Planned transit must be in a MTP or RT Master Plan.

Residential Density with "planned" bus rapid transit, project provides high-density residential development. Mitigation value is based on project density and proximity to planned bus rapid transit. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area. Transit facilities must be within 1/4 mile of project border. Project provides safe and convenient bicycle/pedestrian access to all transit stop(s) within 1/4 mile of project border. Planned transit must be in a MTP or RT Master Plan.

Residential Density with "existing" light rail transit, project provides high-density residential development. Mitigation value is based on project density and proximity to existing light rail transit. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area. Existing transit facilities must be within 1/4 mile of project border. Project provides safe and convenient bicycle/pedestrian access to all transit stop(s) within 1/4 mile of project border.

Residential Density with "existing' bus rapid transit, project provides high-density residential development. Mitigation value is based on project density and proximity to existing bus rapid transit. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area. Existing transit facilities must be within 1/4 mile of project border. Project provides safe and convenient bicycle/pedestrian access to all transit stop(s) within 1/4 mile of project border.

Reduction Methodology & Source[59]
Nelson/Nygaard, 2005. pg 11. (trip reduction = 0.6*(1-(19749*((4.814+households per residential acre)/ (4.814+7.14))^-.639)/25914) (Holtzclaw et al 2002). Asymptote of 60% reduction. **Relative to a 3 du/ac development.** Note that there is no direct empirical support for the added reductions for proximity to transit; the 60% asymptote in this equation is to correct for double-counting from transit services, mix-of-uses, and bicycle and pedestrian connections (which could contribute another 40% reduction).

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is: See Table in Appendix J.

[59] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

20. Street Grid Measure - *Commercial, Mixed-Use, Residential*

Measure Description
Multiple and direct street routing (grid style). The measure applies to projects with an internal connectivity factor (CF)>=0.80, and average of 1/4 mile or less between external connections along perimeter of project. [CF=# of intersections / (# of cul-de-sacs + intersections)].

Reduction Methodology & Source[60]
Reductions are based on CCAP estimates for similar measures. Source: CCAP Transportation Emission Guidebook.

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is 1.0%.

21. Neighborhood Electric Vehicle Access - *Commercial, Mixed-Use, Residential*

Measure Description
Make physical development consistent with requirements for neighborhood electric vehicles (NEV). Current studies show that for most trips, NEVs do not replace gas, fueled vehicles as the primary vehicle. For the purpose of providing incentives for developers to promote NEV use, assume the percent reductions noted below.

For 1.5% reduction, a neighborhood shall have internal NEV connections and connections to other existing NEV networks serving all other types of uses.

For 1.0% reduction, a neighborhood shall have internal and external connections to surrounding neighborhoods.

For 0.5% reduction, a neighborhood has internal connections only.

Reduction Methodology & Source[61]
No direct empirical support for this measure available. May not be relevant/applicable in the near term, until NEVs become more common/inexpensive. Current studies show that for most trips, NEVs do not

[60] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.
[61] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

replace gas-fueled vehicles as the primary vehicle. For the purposes of providing incentives for developers to promote NEV use, assume that a neighborhood with internal NEV connections only receives 0.5 points, with external connections to other surrounding uses, 1.0 point, with external connections to other NEV networks, 1.5 points.

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is between 0.5% and 1.5%.

22. Affordable Housing Component Measure - *Residential*

Measure Description
Residential development projects of 5 or more dwelling units provide a deed-restricted low-income housing component on-site (as defined in Ch 22.35 of Sacramento County Ordinance Code) [Developers who pay into In-Lieu Fee Programs are not considered eligible to receive credit for this measure]. Percent reductions shall be calculated according to the following formula: % reduction=% units deed-restricted below the market rate housing *0.04. The table in Appendix J illustrates sample percent reductions for the percentage of units that are deed restricted below the market housing rate. If the percentage is not listed on the table, the calculation must be done using the equation provided in the methodology.

Reduction Methodology & Source[62]
Nelson/Nygaard, 2005. pg. 15. (trip reduction = % units deed-restricted below market rate housing * 0.04).

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is between 0.6% and 4.0%.

[62] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

MIXED-USE MEASURES

23. Urban Mixed-Use Measure - *Mixed Use*

Measure Description

Development of projects predominantly characterized by properties on which various uses, such as office, commercial, institutional, and residential are combined in a single building or on a single site in an integrated development project with functional inter-relationships and a coherent physical design. Mitigation points for this measure depend on job to housing ratio.

Reduction Methodology & Source[63]

Nelson/Nygaard, 2005. pg. 12. (trip reduction = (1-(ABS(1.5*h-e)/(1.5*h+e))-0.25)/0.25*0.03) where h = study area housing units, e = study area employment (Criteron & Fehr & Peers, 2001). Asymptote of 9% reduction, and an ideal 1.5 jobs per household. Note, these point reductions were taken from Urbemis 2007 9.2.4[64] data according to sample jobs to housing ratio. Cannot get credit for both this measure and the following measures: Suburban Mixed-Use and Other Mixed-Use.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is between 3.0% and 9.0%.

24. Suburban Mixed-Use Measure - *Commercial, Mixed-Use, Residential*

Measure Description

Have at least three of the following on site and/or offsite within ¼ mile: Residential Development, Retail Development, Park, Open Space, or Office.

---

[63] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

[64] Urbemis 2007 Version 9.2.4. Rimpo and Associates.

Reduction Methodology & Source[65]

By definition, this type of land use implies that housing availability is greater than employment availability. On a project-by-project basis, use formula :Nelson/Nygaard, 2005. pg. 12. (trip reduction = (1-(ABS(1.5*h-e)/(1.5*h+e))-0.25)/0.25*0.03) where h = study area housing units, e = study area employment (Criteron & Fehr & Peers, 2001) to obtain higher than 3% reduction. Otherwise, assume 3% max reduction. Cannot get credit for this measure and the following measures: Other Mixed-Use and Urban Mixed-Use measures.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 3.0%.

25. Other Mixed-Use Measure - *Mixed-Use, Residential*

Measure Description

All residential units are within ¼ mile of parks, schools or other civic uses. Civic uses are government facilities that provide services directly to the public (post office, city hall, courthouse, community center, etc.).

Reduction Methodology & Source[66]

This measure has less to do with employment/housing balance. No empirical support for this measure, but logic from suburban mixed-use measure applies. Can't get credit for both this measure and the following measures: Urban Mixed-Use and Suburban Mixed-Use Measures.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 1.0%.

[65] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

[66] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

BUILDING COMPONENT MEASURES

26. Energy Star Roof Measure - *Commercial, Mixed-Use, Residential*

Measure Description

Install Energy Star labeled roof materials. Energy star qualified roof products reflect more of the sun's rays, decreasing the amount of heat transferred into a building.

Reduction Methodology & Source[67]

Reductions are based on the credits documented in the SMAQMD Guidance for Land Use Reductions and consistent with the point rating now set at 0.5 for qualified roof products. Baseline conditions assume indirect emission reduction through more even temperature control of environmental space. Approach is enforceable and may be monitored through site review and/or consultation with lead agency that roofing materials match those described in the SMAQMD Guidance for Land Use Reductions. The District has used a conservative number for this approach.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 0.5%.

27. Onsite Renewable Energy System Measure - *Commercial, Mixed-Use, Residential*

Measure Description

Projects that install renewable energy systems capable of generating 2.5%-12.5% of project's annual energy need shall receive1.0 mitigation points.

[67] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

Reduction Methodology & Source[68]

Reductions are based on the Energy & Atmosphere credits (EA Credit 2) documented in the Leadership in Energy & Environmental Design (LEED), Green Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that at least 12.5% of the buildings total energy use (as expressed as a fraction of annual energy cost) is supplied through the use of on-site renewable energy systems. Alternatively a project may use the Department of Energy (DOE) Commercial Buildings Energy Consumption Survey (CBECS) database to determine the estimated electricity use. Non-polluting and renewable energy potential includes solar, wind, geothermal, low-impact hydro, biomass and bio-gas strategies. When applying these strategies, projects may take advantage of net metering with the local utility. The measure is enforceable through LEED Letter certification and building design calculations demonstrating that at least 12.5% of total energy costs are supplied by the renewable energy system(s). The District has used a conservative number of 1.0 for projects that install renewable energy systems capable of generating 2.5%-12.5% of project's annual energy need.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 1.0%.

28. Exceed Title 24 Measure - *Commercial, Mixed-Use, Residential*

Measure Description

Project Exceeds Title 24 requirements by 20%.

Reduction Methodology & Source[69]

Reductions assume at least a 20% over Title 24 requirements, as calculated by the Sacramento Municipal Utility District (SMUD, 2006 Advantage Home Program Overview). The proposed point value for this operational mitigation measure is 1.0, consistent with the rating assigned to this measure by SMAQMD Land Use Mitigation Measures. Total compliance margin is based on energy savings relative to the total energy budget and cooling energy budget of the Title 24 Standard design home. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, specifications and any available manufacturer's documentation on the devices to be used. This measure's successful implementation may be verified by a site review following

[68] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

[69] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

construction to confirm that the project as built contains ozone destruction catalysts as described in the Air Quality Plan.

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is 1.0%.

29. Solar Orientation Measure - *Residential*

Measure Description
Orient 75 or more percent of homes and/or buildings to face either north or south (within 30 degrees of North or South). Building design includes roof overhangs that are sufficient to block the high summer sun, but not the lower winter sun, from penetrating south facing windows. Trees, other landscaping features and other buildings are sited in such a way as to maximize shade in the summer and maximize solar access to walls and windows in the winter.

Reduction Methodology & Source[70]
Reduction assumes that proper solar orientation can produce a total energy savings of 11% to 16.5% and reduce heating fuel consumption by up to 25% (Local Government Commission, 1998). Mitigation measure points are based on the credits documented in the SMAQMD Guidance for Land Use Reductions and consistent with the point rating now set at 0.5 for proper orientation. Reduction methodology will be based on quantification of the difference in solar radiance from development with designed orientations (75 or more percent of homes and/or buildings to face within 30 degrees either north or south) compared to evenly distributed orientations. Project compliance will be based on the percentage of orientation buildings designed with proper design features (overhangs, landscaping).

Achieved GHG Emission Reductions
With this measure the estimated achieved GHG emission reduction is 0.5%.

[70] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

30. Non Roof Surfaces Measure - *Commercial, Mixed-Use Residential*

Measure Description

Provide shade (within 5 years) and/or use light-colored/high-albedo materials (reflectance of at least 0.3) and/or open grid pavement for at least 30% of the site's non-roof impervious surfaces, including parking lots, walkways, plazas, etc.; OR place a minimum of 50% of parking spaces underground or covered by structured parking; OR use an open-grid pavement system (less than 50% impervious) for a minimum of 50% of the parking lot area. Unshaded parking lot areas, driveways, fire lanes, and other paved areas have a minimum albedo of .3 or greater.

Reduction Methodology & Source[71]

Reductions are based on the Sustainable Site credits (SS Credit 7.1) documented in the Leadership in Energy & Environmental Design (LEED), Green Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that the project provides any combination of the following strategies for 50% of the site landscape (including roads, sidewalks, courtyards and parking lots): Shade (within 5 years of occupancy); paving materials with a solar Reflectance Index (SRI) of at least 29; open grid pavement system.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 1.0%.

31. Green Roof Measure - *Commercial, Mixed-Use, Residential*

Measure Description

Install a vegetated roof that covers at least 50% of roof area. Project should demonstrate detailed graphics depicting the planned roof, detailed information on maintenance requirements for the roof, and the facilities plan for maintaining the roof post construction.

Reduction Methodology & Source[72]

Reductions are based on the Energy & Atmosphere credits (EA Credit 2) documented in the Leadership in Energy & Environmental Design (LEED), Green

[71] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

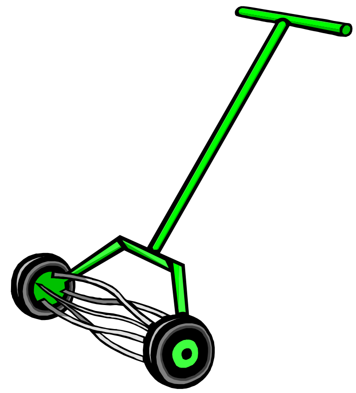
[72] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that a vegetated roof is installed on a least 50% of the roof area or that a combination high albedo and vegetated roof surface is installed that meets the following standard: (Area of SRI Roof/0.75)+(Area of vegetated roof/0.5) >= Total Roof Area.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 0.5%.

TDM & MISC. MEASURES



33. Electric Lawnmower Measure - *Residential*

Measure Description

Provide a complimentary electric lawnmower to each residential buyer.

Reduction Methodology & Source[73]

Reduction is based on a 0.5% reduction in total air shed VOC emissions, as attributable to the Lawn Mower Buy-Back program (Portland, Oregon, ten-year ozone maintenance plan). Mitigation measure points are based on the credits documented in the SMAQMD Guidance for Land Use Reductions and consistent with the point rating now set at 1.0 for electric lawnmowers. Approach is enforceable and may be monitored through site review and/or consultation with lead agency that roofing materials match those described in the SMAQMD Guidance for Land Use Reductions.

Achieved GHG Emission Reductions

With this measure the estimated achieved GHG emission reduction is 1.0%.

[73] *Recommended Guidance for Land Use Emission Reductions, Version 2.4, August 2007*. Sacramento Metropolitan Air Quality Management District.

ADDITIONAL PERFORMANCE STANDARDS REQUIRING FURTHER INVESTIGATION

In addition to those GHG emission reduction measures identified above, the District recognizes there are other potential mitigation measures that can be incorporated into the list but would need further evaluation. In relation, those identifiable measures have been incorporated in the Table in Appendix J.

In parallel, CAPCOA has developed a list of mitigation measures compiled from a number of sources (e.g., CAPCOA White Paper, AG's website, & several air agencies). CAPCOA evaluated the list to eliminate redundancy and rank according to importance or potential GHG control efficiencies. A consultant will be assisting CAPCOA in performing literature search to identify a methodology for quantifying GHG mitigation measure control efficiencies for CO_2, CH_4, and N_2O, and quantifying the control efficiencies. The District participates in this work and will continue to follow it closely as well as other similar types of effort.

SAMPLE ISR PROJECTS

From projects that have complied with Indirect Source Review (ISR), the District has randomly selected three projects to see how they compare to the GHG emission reduction measures proposed by the District to reduce greenhouse gas emissions.

- Sample project 1: Mixed-use development including: 209,650 square feet of commercial space, 278,200 square feet of office space, and 24 dwelling units. The total achieved CO_2 mitigation points achieved for this project was 20.4.

- Sample project 2: Residential development including: 205 single family residential dwelling units. The total achieved CO_2 mitigation points achieved for this project was 11.6.

- Sample project 3: Commercial development including: 59,909 square feet of commercial space. The total achieved CO_2 mitigation points achieved for this project was 14.7.

Based on these samples, the District believes that it will be difficult, but feasible, for development projects to achieve the 29% reduction. However, it would require further mitigation by project proponents than that which is typically being proposed for today's projects.

San Joaquin Valley Greenhouse Gas CEQA Guidance Issue Paper (December 10, 2008)

San Joaquin Valley
Air Pollution Control District

SAN JOAQUIN VALLEY GREENHOUSE GAS CEQA GUIDANCE ISSUE PAPER

December 10, 2008

TABLE OF CONTENTS

CHAPTER 1- INTRODUCTION

The California Legislature enacted CEQA in 1970. CEQA is intended to address a broad range of environmental issues, including water quality, noise, land use, natural resources, transportation, energy, human health, biological species, and air quality. CEQA requires that public agencies (i.e., local, county, regional, and state government) consider and disclose the environmental effects of their decisions to the public and governmental decision makers. Further, it mandates that agencies implement feasible mitigation measures or alternatives that would mitigate significant adverse effects on the environment. CEQA requires public agencies to identify potentially significant effects on the environment of projects they intend to carry out or approve, and to mitigate significant effects whenever it is feasible to do so.

Although AB 32 gives wide responsibility to ARB to regulate GHG emissions from all sources, including non-vehicular sources, it does not preempt or excuse permitting agencies from addressing GHGs under CEQA.

In August 2008 the District's Governing Board adopted the Climate Change Action Plan (CCA). The CCAP authorized the Air Pollution Control officer to develop guidance documents to assist land use agencies address greenhouse gas (GHG) emissions as part of the California Environmental Quality Act (CEQA) process, develop a greenhouse gas banking program, enhance the existing emissions inventory process to include greenhouse gas emissions, and administer voluntary greenhouse gas emission reduction agreements. These items would then be brought before the Governing Board for their consideration.

This white paper focuses solely on various issues concerning the development of District guidance for addressing project related greenhouse emissions during the CEQA process. This paper does not address the other items called for in the CCAP. Information on climate change and governmental activities in California to reduce GHG emissions are presented in the District's Climate Change Action Plan Staff Report.

The intent of this white paper is to provide a starting point for developing guidance for addressing GHG emissions during the CEQA process. There are many potentially valid concepts, each with its own benefits and disadvantages that will be evaluated by the GHG CEQA Guidance Technical Workgroup.

The goals of the GHG CEQA guidance are to provide a mechanism:

- to identify the scope of GHG emissions related to specific projects,
- quantify those GHG emissions,
- identify GHG emissions mitigation measures, and
- to assess the significance of project related GHG emissions.

CHAPTER 2 SCOPE OF PROJECT GHG EMSSIONS

Per CEQA Guidelines Section 15378, "Project" means the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment, and that is any of the following:

(1) An activity directly undertaken by any public agency including but not limited to public works construction and related activities clearing or grading of land, improvements to existing public structures, enactment and amendment of zoning ordinances, and the adoption and amendment of local General Plans or elements thereof pursuant to Government Code Sections 65100-65700.
(2) An activity undertaken by a person which is supported in whole or in part through public agency contracts, grants, subsidies, loans, or other forms of assistance from one or more public agencies.
(3) An activity involving the issuance to a person of a lease, permit, license, certificate, or other entitlement for use by one or more public agencies

For the purpose of this GHG CEQA guidance, a key issue to be resolved is what emissions should be attributed to a project?

Project related GHG emissions could consist of:

- Direct project GHG operational emissions:
    - Combustion emissions,
    - Methane generation, etc

- Ancillary project GHG operational emissions:
    - Power consumption to operate project equipment
    - Power consumption to operate peripheral equipment

- Indirect project GHG emissions:
    - Operational mobile sources emissions
        - Delivery vehicles - raw material
        - Shipping vehicles - finished goods
    - Project life cycle emissions
        - Emissions generated during the entire life cycle of the project: ranging from mining of raw materials, processing those materials into steel, manufacturing of equipment, to shipment and installation of equipment at the project site, etc.

CHAPTER 3 QUANTIFICATION OF PROJECT GHG EMSSIONS

Protocols for quantifying GHG emissions:

- Translating project activities into GHG emissions
- Emission factors associated with each activity

For example, determining GHG emission from electricity consumption associated with the operation of the project equipment would require consideration of the following:

- Energy consumption (e.g. kwh used)
- Source of electricity (e.g. fossil fuel combustion, hydroelectric, solar, etc)
- Energy production characterization (fossil fuel: coal, natural gas, oil, etc)
- Energy production source %
- Emission factors
- Etc

For example, determining GHG emission from mobile sources (raw materials delivery trucks) associated with the project would require consideration of the following:

- Size of truck
- Truck engine tier
- Truck engine horse power
- Vehicle Miles Traveled (VMT)
- % of VMT attributed to the specific project operation
- Fuel type
- Emission factors
- Etc

For example, determining GHG emission from mobile sources (worker commute) associated with the project would require consideration of the following:

- Number of workers
- Number of vehicles
- Type of vehicles
- Carpooling parameters
- Vehicle Miles Traveled (VMT)
- % of VMT attributed to the specific operation
- Fuel type
- Emission factors
- Etc

CHAPTER 4 GHG EMISSIONS MITIGATIONS

CEQA Guideline, section 15370, defines mitigations as:

- Avoiding the impact all together by not taking a certain action or parts of an action,
- Minimizing impacts by limiting the degree or magnitude of the actions and its implementation,
- Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment,
- Reducing or eliminating the impact over time by preservation and maintenance operation during he life of the action, or
- Compensating for the impact by replacing or providing substitute resources or environments.

Identifying GHG emission mitigations would require consideration of the following:

- Reference point:
    - Business As Usual (BAU),
    - AB32 mandates,
    - Etc
- Surplus aspect of proposed mitigation compared to any current or future GHG emission reduction requirements:
    - Identify current and future GHG emission reduction requirements
- Longevity of the GHG emission mitigations:
    - Life of the GHG emissions reduction projects (e.g. planting trees versus trees decomposition, etc)
    - GHG emission reduction future requirements
- Quantification GHG emission mitigations:
    - Type and nature of GHG emissions reduction project
    - Scope of GHG emissions reduction project (See identification and quantification of project GHG emission sections)
- Voluntary Emission Reduction Agreement
- GHG emission reduction banking system used to mitigate future GHG emissions increases
- Verification and enforceability of the proposed GHG emission mitigations:
    - Local GHG emissions reduction projects
    - GHG emissions reduction projects occurring somewhere else on Earth

CHAPTER 5 SIGNIFICANCE OF PROJECT RELATED GHG EMISSIONS

CEQA requires public agencies to identify potentially significant effects on the environment of projects they intend to carry out or approve, and to mitigate significant effects whenever it is feasible to do so. Per CEQA Guidance, section 15382, "Significant effect on the environment" means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance.

This determination of significance must be based on the substantial evidence in light of all the information before the agency. At this time there are no generally accepted thresholds of significance for determining the impact of GHG emissions from an individual project on global climatic change.

Under state law, it is the purview of each lead agency to determine what, if any, significance thresholds will be established to guide its review of projects under CEQA. Traditionally, the District has provided local lead agencies technical guidance for assessing a project's potential impact on air quality, including establishment of significance thresholds for criteria pollutants.

Existing and proposed approaches to addressing the significance of GHG emissions during the CEQA process will be discussed and evaluated.

Possible approaches for addressing GHG during the CEQA process:

- Single GHG significance threshold
- Multiple GHG significance thresholds
- Specific project type determination
- Program level CEQA determination
- Facility level CEQA determination
- Performance based threshold
- Tiered classification of projects' impacts
- Combination of any of the above
- Others, to be determined

CEQA GHG Guidance
Project Scope Subcommittee

Characterization of Greenhouse Gas Emissions

February 10, 2009

The District has actively sought input from the ad hoc committee and the following document is still under development. The District is still receiving comments from the committee, which will be considered before finalizing this document.

Ad Hoc Committee Members:

Daniel Barber, J.P Cativiela, Dennis J. Champion, Casey Creamer, Tin Cheung, Dawn S. Chianese, Kevin Clutter, Jerry Frost, Wendy Garcia, Sarah Jackson, Julia Lester, Arnaud Marjollet, Mark Montelongo, Elena Nuno, Dennis Roberts, Patia Siong, Dennis Tristao, Tom Umenhofer, and Nicole Vermilion.

See appendix A

CEQA GHG Guidance Project Scope, February 10, 2009

Introduction

During the Greenhouse Gas (GHG) CEQA Guidance Technical Workgroup meeting an ad hoc committee was formed to evaluate GHG emissions resulting from one industrial and one non-industrial project. Key objectives were to identify and quantify potential direct sources of GHG emissions, to the extend feasible, identify and quantify potential indirect GHG emissions, and to report back to the Technical Workgroup, providing guidance/recommendations regarding the scope of GHG emissions to be considered during the CEQA environmental review process.

Several discussions were coordinated on these key objectives over four conference calls that were held on December 17 and 23, 2008 and on January 6 and 9, 2009. This document summarizes the subcommittee's discussions.

The industrial project selected by the committee consists of adding a 14.6 MMBtu/hr natural gas fired powdered milk spray dryer operation increasing throughput of an existing milk processing facility by 1,200 tons of milk per day. The mixed-use development project consists of 201,000 sq ft commercial, 278,000 sq ft of office space, plus 24 residential units, all situated on 40 acres. Both projects are actual projects submitted to the District. When possible, GHG emissions were calculated using project specific information, otherwise, assumptions were made using best available information.

Emission sources were categorized as either Direct, Indirect, or lifecyle. Direct emissions result from a physical change in the environment which is caused by and which is immediately related to the project. Examples of direct emissions are operational emissions (emissions from activities occurring on-site), mobile source emissions (vehicular emissions resulting from delivery of operational materials to the facility, shipment of finished goods, and vehicular emissions resulting from employee, customer, or residential traffic), and emissions from on-site construction activities. Direct emission sources are traditionally considered during the CEQA review process. Indirect emissions result from a physical change in the environment which is not immediately related to the project, but is caused by the project. Examples of indirect emissions include emissions resulting from the generation of electricity to meet project related energy demands. Lifecycle emissions result from a physical change in the environment which is not immediately related to the project, but is caused by a given product or service caused or necessitated by the existence of a project. Examples of lifecycle emissions include emissions from mining, timber harvesting, processing raw materials into intermediate, i.e. converting iron ore into steel, and fabrication of raw materials into finished goods used by a project. Details of emissions sources are presented in attached Table-1 and Table-2.

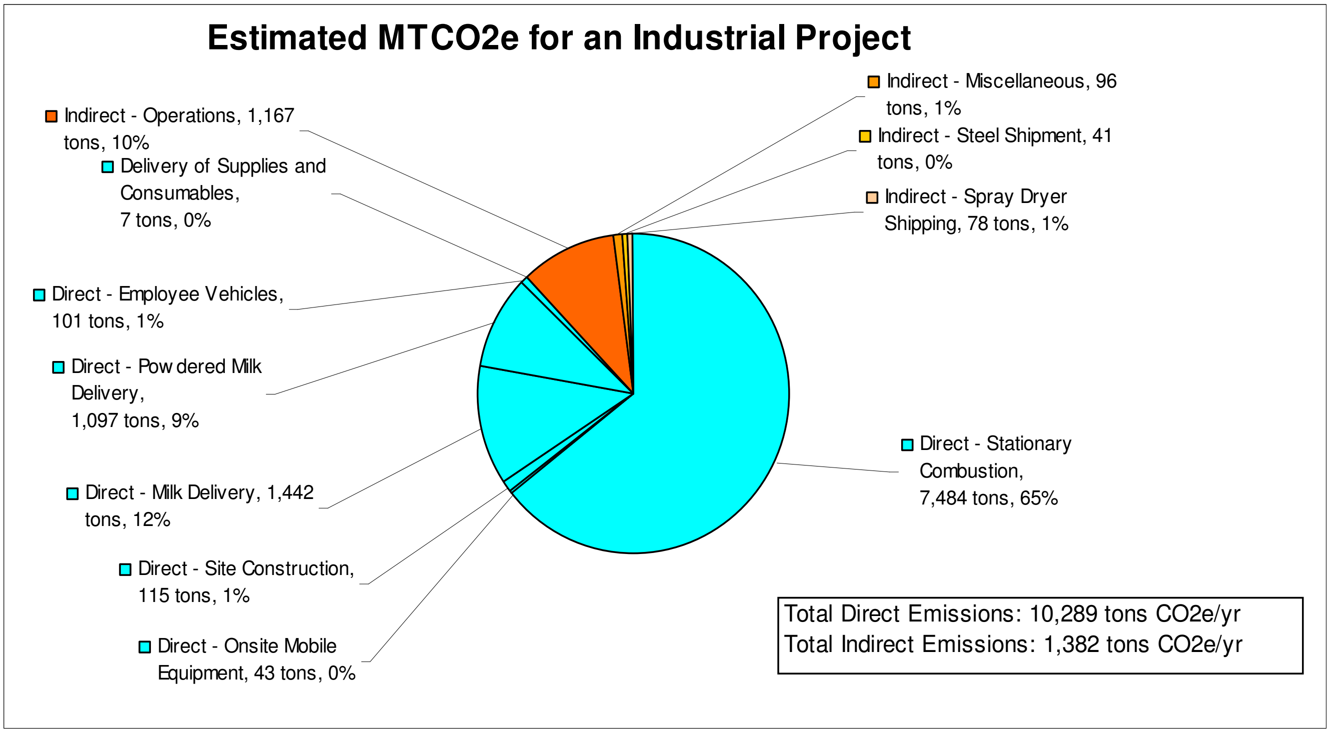
CEQA GHG Guidance Project Scope, February 10, 2009

Industrial Project Emissions – Determinations

The following statistics, also shown in Figure 1, pertain to the industrial project described above:

- Stationary source emissions account for about 70% of direct emissions
- Mobile source emissions account for about 26% of direct emissions
- Construction emissions account for about 1% of direct emissions
- Electrical power consumption account for about 95% of indirect emissions
- Shipment of steel and boiler account for about 5% of indirect emissions
- Total indirect emissions account for about 12% of combined total direct and indirect emissions

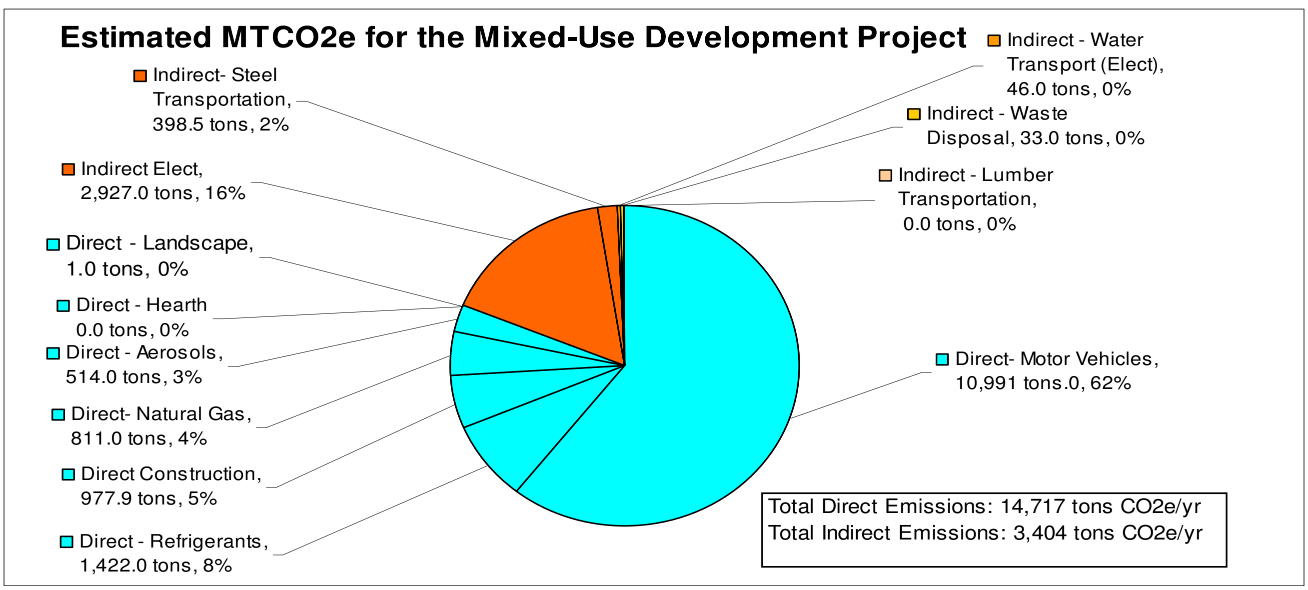
Figure 1: Estimated GHG Emissions for an Industrial Project



Mixed-Use Project Emissions – Determinations
The following statistics, also shown in Figure 2, pertain to the mixed-use project described above:

- Mobile source emissions account for about 75% of direct emissions
- Refrigerant loss account for about 10% of direct emissions
- Construction emissions account for about 7% of direct emissions
- Natural gas consumption account for about 6% of direct emissions
- Aerosol emissions account for about 4% of direct emissions
- Electrical power consumption account for about 97% of quantifiable indirect emissions
- Total indirect emissions account for about 19% of combined total direct and indirect emissions
- It was not feasible to estimate indirect emissions associated with transportation of raw materials and finished goods

Figure 2: Estimated GHG Emissions for an Mixed- Use Development Project



The assumptions used in the analysis of these two projects can be found in Appendix B and Appendix C.

CEQA GHG Guidance Project Scope, February 10, 2009

Indirect Emissions from Electrical Power Consumption - Determinations
The following points represent the committee's majority opinion on this topic:

- For both industrial and non-industrial projects it is feasible to estimate potential electrical consumption and the associated indirect GHG emissions
- Decreasing electrical power consumption would reduce GHG emissions and concomitantly have a positive impact on global climatic change
- Estimating emissions from electrical power consumption is speculative because the actual source of generation (wind, fossil fuel, nuclear, hydroelectric, etc) and location of generation (within or outside California) is unknown
- Traditionally, indirect emissions associated with production of electrical power are not attributed to a development or industrial project
- Emissions resulting from electrical power generation have already been attributed to the power production facility and the power production facility has already been required to mitigate the impacts of its emissions
- Power generating facilities are subject to AB32 emission reduction targets and thus, will be required to mitigate their GHG emissions
- Including indirect emissions associated with electrical power consumption likely double counts GHG emissions associated with electrical power generation. Thus, overstating a project's environmental impacts

Indirect Emissions from Raw Materials and Finished Goods (Lifecycle Emissions) - Determinations
The following points represent the committee's majority opinion on this topic:

- Within limits, it was feasible to estimate potential emissions associated with transportation of raw materials and delivery of finished goods for industrial projects.
- It was not feasible to estimate indirect emissions associated with transportation of raw materials and finished goods for non-industrial projects.
- Estimation of potential emissions associated with transportation of raw materials and delivery of finished goods is highly speculative.
- Knowing emissions resulting from manufacturing and transportation of finished goods could influence decisions on sourcing products and consumer consumption.
- Reducing emissions associated with manufacture and transportation of finished goods would have a positive impact on global climatic change.
- Emissions associated with transportation of raw materials and delivery of finished goods is a minor percentage of direct project emissions.

Greenhouse Gas Reporting Protocols

As a starting point, the committee reviewed two greenhouse gas reporting protocols: (1) the General Reporting Protocol (the Protocol) developed by the California Climate Action Registry, and (2) the Greenhouse Gas Protocol (GHG Protocol) developed by the World Business Council for Sustainable Development and the World Resources Institute.

The Protocol is used primarily by California Registry members in calculating and reporting emissions through the California Action Registry Reporting Online Tool. It provides guidance for businesses, government agencies, and non-profit organizations to participate in the California Climate Action Registry, a voluntary greenhouse gas registry. The Protocol is used to report emissions within California or with the United States.

The GHG Protocol also provides guidance for businesses and other organizations. It consists of two modules: the Corporate Accounting and Reporting Standards and the Project Accounting Protocol Guidelines. The first one contains methodologies for business and others to inventory and report all of the GHG emissions they produce. The latter one is geared toward calculating reductions in GHG emissions from specific GHG-reduction projects. The GHG Protocol states that the GHG assessment boundary is to include all the GHG effect regardless of where they occur and who has control over the sources and sinks associated with them.

The Protocol identifies the operational boundaries through direct emissions and indirect emissions. The GHG Protocol also identifies the emissions as direct or indirect but uses several types of scope of accounting and reporting for indirect emissions.

Methodologies for calculating GHG emission are relevant to calculating project specific GHG emission and were used here. More details on the reporting requirements can be found at http://www.climateregistry.org/tools/protocols/general-reporting-protocol.html for the Protocol, and at http://www.wri.org/project/ghg-protocol for the GHG Protocol.

Discussion:
Pursuant to the California Environmental Quality Act (CEQA) Guidelines Section 15064(d), “in evaluating the significance of the environmental effect of a project, the Lead Agency shall consider direct physical changes in the environment which may be caused by the project and reasonably foreseeable indirect physical changes in the environment which may be caused the by project.” The CEQA Guidelines clearly

states that a physical change that is speculative or unlikely to occur is not reasonably foreseeable (CEQA Guidelines Section 15064[d][3]).

While use of raw materials for construction and operation is an indirect consequence of a project, the emissions and potential environmental impacts associated with the production and transportation of raw materials is unknown and estimation of said emissions is highly speculative. The quantification of emissions associated with raw material usage is likely to be double-counted when developing emission inventories for industrial sources. The source of the raw materials and/or manufacturing processes associated with raw material usage may occur outside the state and is not included in the emissions inventory for the state and therefore should not be included in the emissions inventory for the project for the purposes of CEQA.

Substantial research would be required to minimize the speculative nature of trying to characterize indirect emissions for each project. Project proponents would have to determine the origin of the materials used during the construction and/or operation of the project. Additional research would be necessary to gather emission rates for the international vehicles (ship, aircraft, trains, trucks, etc.), global energy production, global industrial processes, and other GHG emitting processes. Even if this information is compiled, the resulting estimates represent an insignificant percentage, as compared to direct project emission.

While indirect emissions from electrical power consumption can be estimated, the estimate is speculative because actual emissions are determined by the source of power used to generate the electricity (wind, fossil fuel, nuclear, hydroelectric, etc), which is largely unknown for the power being consumed by a specific project. Furthermore, the source of power generation is unknown and may occur outside the boundaries of the air basin or the borders of California. Estimates of indirect emissions from electrical power consumption would be speculative and estimates may not be accurate.

Furthermore, traditionally, indirect emissions associated with production of electrical power are not attributed to a development or industrial project. Emissions of criteria pollutants resulting from electrical power generation have already been attributed to the power production facility and the power production facility has already been required to mitigate the impacts of its criteria pollutants emissions. The same logic applies to GHG emissions. Power generating facilities are subject to AB32 emission reduction targets and thus, will be required to mitigate their GHG emissions. Including indirect emissions associated with electrical power consumption would likely double count GHG emissions associated with electrical power generation and overstate a project's environmental impacts.

Indirect emissions associated with waste disposal can be estimated. However, as with indirect emissions associated with electrical power generation, criteria pollutants emissions resulting from waste disposal have already been attributed to the waste disposal facility. Indeed, the waste disposal facility has already been required to mitigate its operational environmental impacts. As with power generating facilities, waste disposal facilities are subject to AB32 emission reduction targets and thus, will be required to mitigate their GHG emissions. Including indirect emissions associated with waste disposal would likely double count GHG emissions and overstate a project's environmental impacts.

CEQA GHG Guidance Project Scope, February 10, 2009

The project consists of:

40 acres	
201,000 sqft	commercial
278,000 sqft	office
24 units	residential

NOTES:

(1) The sources and emissions are based on project specific data already available.

(2) Emissions for waste disposal were obtained using EPA's Waste Reduction Model (WARM).
http://epa.gov/climatechange/wycd/waste/calculators/Warm_home.html

(3) Data for residential and businesse waste disposal rate was obtained from the California Integrated Waste Management Board
http://www.ciwmb.ca.gov/Profiles/

(4) URBEMIS 2007 was used to estimate emissions from construction.

Appendix B

Basis for Greenhouse Gas Estimate for Powdered Milk Spray Dryer Operation

Direct Emissions – Stationary Source

- Maximum Firing Capacity for spray dryer is 14.6 MMBtu/hr natural gas
- Facility will operate 8760 hr/yr
- Burner Utilization is 100%
- Emission factors (with Global Warming Potential) for natural gas combustion are from CCAR, V.3, April, 2008:

	kg/MMBtu	lb/MMBtu	GWP	lb- CO_2E/scf
CO_2:	53.06	116.7	1	116.7
Methane:	0.0059	0.013	21	0.27
N2O	0.0001	0.00022	310	0.068

- Emissions for milk evaporation (from delivered milk to 50% concentrate fed to the dryer) are attributed to the existing milk evaporation system (3 boilers) and not included with the dryer.
- 50 hp forklift used to handle bagged product. Operates 8 hours per day with 50% utilization of horsepower and 30% thermal efficiency.
- Emission factors (with Global Warming Potential) for LPG-powered vehicles are from CCAR, V.3, April, 2008 for California:

	g/mile	lb/mile	GWP	lb- CO_2E/gal
CO_2:	-	-	1	12.7*
Methane:	0.04	$8.81x10^{-5}$	21	0.00037**
N2O	0.04	$8.81x10^{-5}$	310	0.00547**

* CO_2 is based on 5.79 kg/gal for diesel (per CCAR) and an annual fuel consumption of 6,751 gal LPG
** Methane and N2O are based on hypothetical fuel economy of 5 mpg

Direct Emissions - Construction

- Construction emissions include direct emissions from construction sources at the plant site plus emissions associated with shipping of the spray dryer
- Construction site CO_2 emissions were estimated using URBEMIS and assume a 2 acre site with 10,400 square feet of combined industrial building and office space.
- Methane and N2O emissions for construction were approximated by factoring from the CO_2 emissions based on the heavy truck emission factors presented above.

CEQA GHG Guidance Project Scope, February 10, 2009

Direct Emissions - Offsite Vehicle Travel

- Maximum Milk Solids processing is 84.6 tpd dry product
- Powdered milk product trucks carry 25 tons per round trip and travel 478 miles per round trip at 6 mpg.
- Delivered raw milk quantity is estimated based on 7 wt% milk solids in raw milk.
- Milk delivery trucks travel 44 miles round trip at 6 mpg and carry 6000 gal per round trip.
- Emission factors (with Global Warming Potential) for Heavy Trucks are from CCAR, V.3, April, 2008 for California:

	g/mile	lb/mile	GWP	lb- CO_2E/mi
CO_2:	-	3.72*	1	3.72
Methane:	0.0051	1.12×10^{-5}	21	0.00024
N2O	0.0048	1.06×10^{-5}	310	0.00328

* CO_2 is based on 10.15 kg/gal for diesel (per CCAR) and a fuel efficiency of 6 mpg

- Average employee travel is 35 mi round trip with average fuel economy of 18 mpg
- Plant staff:

Administrative Staff:	10 per shift, 5 shifts per week (shared with evaporator)
Operations Supervisor:	1 per shift, 3 shifts per day (shared with evaporator)
Dryer Operators:	2 per shift, 3 shifts per day
Maintenance	5 per shift, 5 shifts per week (shared with evaporator)
Security	1 per shift, 3 shifts per day (shared with evaporator)

- Emission factors (with Global Warming Potential) for Passenger Cars are from CCAR, V.3, April, 2008 for California:

	g/mile	lb/mile	GWP	lb- CO_2E/mi
CO_2:	-	1.08*	1	1.08
Methane:	0.026	5.73×10^{-5}	21	0.0012
N2O	0.032	7.05×10^{-5}	310	0.0219

* CO_2 is based on 8.81 kg/gal for diesel (per CCAR) and a fuel efficiency of 18 mpg

Mobile Source Emissions Associated with Shipment of Plant Operating Supplies and Consumables:

- Total installed cost for the dryer system was $20,000,000 (assumed)

- Annual expense for plant consumables and operating supplies is 2% of TIC = $400,000/year(2 x typical per Peters and Timmerhaus, Plant Design and Economics for Chemical Engineers, 2nd ed, McGraw-Hill, 1958.)
- Shipping cost for plant consumables and operating supplies is 5% of value or 0.05 x 200,000 = $20,000/year (assumed)
- Shipping rate is $5.40/mi (a shipping expenditure of $5.40 generates one vehicle mile for a heavy diesel truck – rough estimate based on published UPS shipping rates)

Indirect Emissions - Electric Power

- Operating electrical loads consist of:
  Main Blower Motor @ 250 hp (per applicant)
  Rotary atomizer for dryer @ 75 kw power input (basis GEA Niro literature)
  Pumps for handling milk are 10 bhp (assumed)
  Product conveying and bagging requires 15 bhp (assumed)
- Electric Motor Efficiency is 90%
- Emission factors (with Global Warming Potential) for electricity usage are from CCAR, V.3, April, 2008 for California:

	lb/MWh	GWP	lb- CO_2E/MWh
CO_2:	878.71	1	878.71
Methane:	0.0067	21	0.15
N2O	0.0037	310	1.1

- Miscellaneous electrical loads:
  Instrumentation and anciliary loads = 2 kw
  Dryer is housed in a 100' x 100' expanded manufacturing area (indoors) which requires 24 hour lighting at 2.2 W/ft2
  400 ft2 incremental office space associated with the milk drying operation requiring 2.5 W/ft2
  Plant outdoor lighting assumed to be existing.

Indirect Emissions - Miscellaneous

- Specific power consumption for ocean shipping (main engine output) is 0.04735 kwh per ton-milebased on data for the “Emma Maersk” (freight capacity of 61,213 tons requiring 80,000 kw to maintain a speed of 24 knots).
- Ship fuel consumption is 203 g/kwh (residual fuel oil) per: Cooper, David, “Representative Emission Factors for use in Quantification of Emissions from Ship Movements Between Port in the European Community”, Swedish Environmental Research Institute, 2002.
- Ship transit CO_2 emission factor is 677 g- CO_2 /kw per ARB's “Emission Inventory for Ship Main Engines and Boilers”

CEQA GHG Guidance Project Scope, February 10, 2009

- Ship methane and N2O emission factors are based on CCAR factors for combustion of residual fuel oil at a stationary source and on the calculated fuel consumption.
- Due to length of shipment, emissions due to anchorage and hoteling were assumed to be negligible.
- The dryer is assumed to be procured and shipped from China (Hong Kong to Los Angeles - one-way shipping distance of 7,300 miles) and only cargo ship emissions are considered.
- Dryer is assumed to weigh 300 tons.
- Steel (300 tons) is assumed to be shipped from India to China (Mumbai to Hong Kong – one way shipping distance of 3,837 miles)

CEQA GHG Guidance Project Scope, February 10, 2009

Appendix C

Basis for Greenhouse Gas Estimate for a Mixed-Use Development Project

Direct Emissions

Motor Vehicles

- The vehicle percentages are based on default values in URBEMIS 2002.
- The build-out for this project is year 2010.
- The vehicle miles traveled is estimated at 61,000 with 12,200 trips.
- The emission factors for the running emissions are based on the U.S. Environmental Protection Agency and Climate Leaders Greenhouse Gas Inventory Protocol – Core Module Guidance, for direct emissions from mobile combustion sources.
- The emission factors for the starting emissions are based on the U.S. Environmental Protection Agency EPA420-P-04-016 (Update of Methane and Nitrous Oxide Emission Factors for On-highway Vehicles).

Refrigerant

- It is assumed that there are 24 domestic refrigeration units, about 490 units of Residential/office/commercial A/C ranging in capacity.
- An annual leak rate in percent of capacity is included.

Construction

- URBEMIS 2007 was used to obtain emissions from construction.
- The analysis evaluates the project consisting of 40 acres, 201,000 square feet of commercial land use, 278,000 square feet of office land use, and 24 multi-dwelling residential units in Fresno County.
- The construction timeline was one year.

Natural Gas

- A natural gas usage factor based on default value in URBEMIS 2002 for methane and nitrous oxide was assigned to the type of land (e.g.: office, retail/shopping, residential, etc.) and its associated square footage or units.

Aerosols

- MOBILE6 and URBEMIS 2007 were used to estimate the carbon emissions for this arena.

Landscape

- URBEMIS 2007 was used to obtain landscape emissions.

Hearth

- No hearth emissions were included as there were no wood-burning fireplaces in the development per City of Fresno code, however if hearths were allowed URBEMIS 2007 would have been used to provide the hearth emissions.

Indirect Emissions

Electricity

- The emission factor was obtained from the General Reporting Protocol – Reporting Entity-wide Greenhouse Gas Emissions, Version 2.2, March 2007 by the California Climate Action Registry.
- The residential electricity usage rate was assumed to be 5626.50 kwh/unit/yr based on South Coast Air Quality Management 1993 CEQA Handbook, Table 9-11-A.
- The electricity use was based on Table E-1 from the California Energy Commission - California Commercial End-Use Survey March 2006.
- The analysis evaluates the project consisting of 201,000 square feet of commercial land use, 278,000 square feet of office land use, and 24 multi-dwelling residential units.
- The total electricity use is about 8,000 MWh/year.

Steel Transportation

- Specific power consumption for ocean shipping (main engine output) is 0.04735 kwh per ton-milebased on data for the “Emma Maersk” (freight capacity of 61,213 tons requiring 80,000 kw to maintain a speed of 24 knots).
- Ship fuel consumption is 203 g/kwh (residual fuel oil) per: Cooper, David, “Representative Emission Factors for use in Quantification of Emissions from Ship Movements Between Port in the European Community”, Swedish Environmental Research Institute, 2002.
- Ship transit CO_2 emission factor is 677 g- CO_2 /kw per ARB’s “Emission Inventory for Ship Main Engines and Boilers”
- Ship methane and N2O emission factors are based on CCAR factors for combustion of residual fuel oil at a stationary source and on the calculated fuel consumption.
- Due to length of shipment, emissions due to anchorage and hoteling were assumed to be negligible.
- The steel is assumed to be shipped from India to Los Angeles – (one-way shipping distance of 10,500 miles) and only cargo ship emissions are considered.
-

Water Transport (Electricity use in typical urban water systems)

- Emission factor was obtained from the General Reporting Protocol – Reporting Entity-wide Greenhouse Gas Emissions, Version 2.2, March 2007 by the California Climate Action Registry.

CEQA GHG Guidance Project Scope, February 10, 2009

- Emission factor was also from the California's Energy-Water Relationship Final Staff Report, November 2005 by the California Energy Commission.
- It is assumed that there's about 80,000 gallons per day of water and about 115,000 kWh in energy usage.

Waste Disposal

- Waste disposal data was obtained from the California Integrated Waste Management Board – 1999 estimated materials disposed by residential sector and 1999 estimated business waste amounts for Fresno County.
- It is estimated that 137 tons of waste would be generated.
- Data was entered into US EPA's Waste Reduction Model to obtain greenhouse gas emissions.

Lumber Transportation

- It is assumed that lumber is shipped to Fresno from Springfield, Oregon. The one-way travel distance is 669 miles.
- It is estimated that 16,000 board feet of lumber is needed for a house of 2,000 square feet.
- The number of train hauling cars is 75 cars in which 24 would be used to transport lumber. The hauling capacity is about 100 tons per cars which would equate to about 12,000 board feet of lumber.
- The conversion emission factor for diesel is 0.0287 kg CO_2 /mile based on the calculation tool provided by the GHG Protocol – Mobile Guide, Version 1.3, March 2005.

CEQA GHG Guidance Project Scope, February 10, 2009

Appendix D

Summary of Written Comments

Written comments pertaining to proposed recommendations for establishing the scope of a project's greenhouse gas impacts are summarized below.

1. Sarah Jackson (Earth Justice)

One of CEQA's main functions is to provide public agencies and the general public "with detailed information about the effects of a proposed project on the environment." *San Franciscans for Reasonable Growth v. City & County of San Francisco*, 151 Cal. App. 3d 61, 72 (1984). Full analysis of all direct and indirect emissions caused by a project, using a lead agency's "best efforts to find out and disclose all that it possibly can," CEQA Guidelines section 15144, will provide maximum opportunities for mitigation and will allow for more environmentally sound decision-making. Furthermore, CEQA requires that indirect or secondary effects "which are caused by the project and are later in time or farther removed in distance, but are still reasonably foreseeable," CEQA Guidelines section 15358(a), be analyzed. Both the ARB and South Coast have determined that lifecycle analyses of GHGs are appropriate and South Coast recently proposed that lifecycle analyses be prepared for all projects undergoing CEQA analysis in order to "produce a more defensible approach." *See* South Coast Interim GHG Significance Threshold Staff Proposal at 3-7, October 2008. Categorical exclusions of emissions from analysis is contrary to CEQA's purpose and would minimize the true environmental impact of the project.

2. Gordon Nipp (Kern-Kaweah Chapter of Sierra)

- Emissions from project electricity consumption can be estimated by following the Climate Action Registry protocol. The basic methodology uses updated US EPA-developed EGRID emission factors for calculating indirect emissions from electricity use. For California, this factor is 878.71 pounds of CO_2 per MWh of usage, a figure that is lower than for many other regions because it includes renewables production. While anyone can call any such figure "speculative", this protocol is in current usage and is well established. Electricity consumption estimations should not be considered speculative.
- Including indirect emissions associated with a project's electricity consumptions as part of the project's environmental impact and requiring mitigation for this impact would not lead to double counting of these emissions. If, for example, a project were required as mitigation to generate a portion of its electricity with solar PV, the electricity generated by the project's PV would not have to be generated by a power plant. The power plant would not be required to mitigate

CEQA GHG Guidance Project Scope, February 10, 2009

impacts of electricity generated by project PV, electricity that the power plant doesn't have to generate.

- Indirect GHG emissions from electrical power generation should be included during CEQA review.

3. Wendy Garcia (Constellation Wines)

1) Regarding power consumption: I believe the project scope recommendations would be stronger by removing statements such as:

"Estimating emissions from electrical power consumption is speculative because the actual source of generation (wind, fossil fuel, nuclear, hydroelectric, etc) and location of generation (within or outside California) is unknown."

These emissions can be estimated. Power providers such as PG&E, SCE and others contract with, and purchase power from, specific electical generators. It is not speculative.

2) The de minimus level for reporting of GHG emissions is 3 to 5 percent, depending upon the reporting program. In the scope recommendation document indirect emissions are greater than 5% of total GHG emissions, so they are significant, but for the other reasons cited, indirect emissions should be left out of the scope for quantifying GHGs for CEQA purposes.

Final Draft Staff Report

Appendix F:
CEQA GHG Guidance Level of Significance Subcommittee (March 5, 2009)

CEQA GHG Guidance
Level of Significance Subcommittee

May 5, 2009

The District has actively sought input from the ad hoc committee and the following document is still under development. The District is still receiving comments from the committee, which will be considered before finalizing this document.

Ad Hoc Committee Members
Bettina Arrigoni, Daniel Barber, John Beckman, David Campbell, Donna Carpenter, Dennis J. Champion, Tin Cheung, Dawn S. Chianese, Casey Creamer, Caroline Farrell, Jerry Frost, Wendy Garcia, Issac A. George, Spencer Hammond, Erin Burg Hupp, Sarah Jackson, Bob Keenan, Julia Lester, John Ludwick, Arnaud Marjollet, Michael B. McCormick, Mark Montelongo, Gordon Nipp, Elena Nuno, Tonya Short, Patia Siong, David Smith, Lee Smith, Dennis Tristao, Tom Umenhofer, Lisa Van De Water, and Nicole Vermilion.

See Appendix A

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee
May 5, 2009

Introduction

During the Greenhouse Gas (GHG) CEQA Guidance Technical Workgroup meeting an ad hoc committee was formed to provide guidance/recommendations to be applied when determining the significance project specific GHG emissions during the CEQA environmental review process.

Key tasks for the subcommittee include:

- Review of current CEQA requirements/guidelines for determining significance, including lead agency authority and responsibilities for determining significance
- Review actions by the following agencies that are to be developing GHG significance thresholds: Office of Planning and Research (OPR), California Energy Commission (CEC), Caltrans, Air Resources Board (ARB), South Coast Air Quality Management District (SCAQMD), Council of Governments (COG), and California Air Pollution Control Officers Association (CAPCOA)
- Discuss committee views on establishing GHG significance thresholds. In support of the discussion, the subcommittee identified the following key questions to be addressed:

1. Zero Threshold:
   - What are the pros and cons of implementing a zero significance threshold?
   - What are the pros and cons of implementing a zero versus a non-zero significance threshold?
2. If a non-zero threshold would be recommended, should the metric for determining significance consist of a numerical threshold, a qualitative assessment, or are both approaches valid?
3. If there is a dual path (qualitative and quantitative), is it necessary to demonstrate equivalency, if so, how?
4. If a numeric value is established, is the value specific to a project type, or does the same value apply to all project types?
5. What metrics should be considered in establishing a quantitative threshold?
6. What metrics should be considered in establishing a qualitative significance threshold?

Several discussions were coordinated on these key objectives over four conference calls that were held on January 15, 23, 28, February 2, 6, and 10, 2009. Written comments received by the District are presented in Appendix K. The following summarizes the committee's progress.

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee
May 5, 2009

Review of Lead Agency Authority and Responsibilities

To establish a common understanding, the subcommittee reviewed current CEQA requirements/guidelines for determining significance, including lead agency authority and responsibilities for determining significance. Subsequently, the subcommittee reviewed OPR's draft amended CEQA Guidelines for addressing GHG impacts during the CEQA process. The committee concludes that most of OPR's draft provisions are logical extensions of the CEQA and the provisions do not functionally change lead agency authority and responsibility under CEQA. The following are the main factors of OPR's proposed amendments to CEQA Guidelines addressing GHG impacts, (See *Appendix B* for more detail):

1) Exceedance of thresholds;
2) Emissions calculated and compared to a threshold, qualitative, or performance-based standards [for editorial additions, see reference 15064.4 (b) (4)];
3) Other agency thresholds can be used to set levels;
4) Increase or decrease in energy use/efficiency (not clear whether local or regional); and
5) Projects impact on attainment to AB 32 goals.

Review of Other Agencies Approaches to Determine GHG Significance

The group reviewed approaches proposed or adopted by the following agencies:

- Office of Planning and Research (OPR), (*Appendix B*)
- California Energy Commission (CEC), (*Appendix C*)
- Caltrans,
- Air Resources Board (ARB), (*Appendix D*)
- South Coast Air Quality Management District (SCAQMD),
- Council of Governments (COG), and
- California Air Pollution Control Officers Association (CAPCOA) (*Appendix E*)

Views on Determining GHG Significance

To provide for stakeholder input the District encouraged subcommittee members to discuss their views on various approaches for determining significance of project related GHG. To facilitate the discussion, the subcommittee is working through the key questions identified above. The following discussion summarized the subcommittee's progress.

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee
May 5, 2009

Zero Threshold

1. *Zero Threshold:*
   - *What are the pros and cons of implementing a zero significance threshold?*
   - *What are the pros and cons of implementing a zero versus a non-zero significance threshold?*

There are two fundamental approaches; establish a zero threshold, meaning that any project that emits GHG emissions has a significant impact, or establish a non-zero threshold, meaning that projects below a threshold would be determined to have a less than significant impact. There was considerable discussion and strong opinions on this issue.

The underlying concept of a zero threshold is that there is no level below which project specific GHG emissions would be considered to have a less than significant impact. Those recommending adoption of a zero threshold cite the following reasons:

- Would accelerate attainment of AB32 emission reduction targets
- Mitigating to zero would ensure that a project would not have a significant individual and cumulative impact
- Very easy to understand if a project would be considered significant
- Projects with GHG emissions would require preparation of an environmental impact report (EIR), thus requiring lead agencies to require all feasible mitigation measures
- No scientific basis to conclude that any level, other than zero, would not have a significant impact on global climatic change

The underlying concept of a non-zero threshold is that there is a level below which it is reasonable to conclude that project specific GHG emissions would have a less than significant impact. Those in favor of adopting a non-zero threshold cite the following reasons:

- Adopting a zero threshold would result in all projects with GHG emissions being determined to have a significant impact, thus requiring preparation of an EIR for every project with GHG emissions
- CEQA does not require mitigating project related impacts to less than significant and since it is not technically or economically feasible to mitigate to zero, most likely, projects would be approved by adopting overriding considerations
- To mitigate project related GHG emissions to less than significant would require mitigation of 100 percent of all GHG emissions

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee
May 5, 2009

- Not technically feasible to mitigate <u>all</u> projects with GHG emissions to zero, without stopping growth within the District and perhaps, California
- No scientific basis to conclude that a specific project would have a measurable impact on global climatic change

Non-Zero Threshold

2. *If a non-zero threshold would be recommended, should the metric for determining significance consist of a numerical threshold, a qualitative assessment, or are both approaches valid?*

There was considerable discussion surrounding these two questions with little resolution at this time. The major theme is that there is no scientific information available at this time to support a numeric value. The subcommittee acknowledges that ARB and South Coast AQMD both have proposed establishing thresholds based on percentages of the emission inventory for industrial sources. The subcommittee also acknowledges that OPR in drafting amendments to CEQA Guidelines provide for significance determinations based on either quantitative or qualitative assessments. The subcommittee further acknowledges that guidance being developed by ARB and South Coast includes provisions for both qualitative and quantitative determinations. The majority opinion is that if a non-zero approach is adopted, there should be flexibility to use both quantitative and qualitative approaches.

Qualitative Versus Quantitative Significance Determination

3. *If there is a dual path (qualitative and quantitative), is it necessary to demonstrate equivalency, if so, how?*
4. *If a numeric value is established, is the value specific to a project type, or does the same value apply to all project types?*

The District diagrammed four possible approaches illustrating how quantitative and qualitative standards could be used for assessing project related GHG impacts, (*Appendix* F – J). One approach is to evaluate significance based on whether or not a project is consistent with a quantitative standard <u>OR</u> is below some qualitative standard. Another approach presented is to evaluate significance based on whether a project is consistent with a qualitative standard <u>AND</u> is below some quantitative standard. The third and fourth approaches would evaluate significance based on a tiered or “Waterfall” approach, which could be a combination of quantitative and qualitative standards. It was recognized that regardless of the approach used, projects determined to be exempt under CEQA would be considered to have a less than significant impact.

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee
May 5, 2009

The pros and cons of each approach were explored and the following common themes emerged:

- Other than if a single numerical value were to be applied across all projects, qualitative and quantitative significance standards should be developed for each type of emission source (sectors). Identified sectors included development projects, transportation projects, energy production, and industrial projects.
- It will take time to develop qualitative standards and there is reasonable probability that the standards will be controversial and subject to litigation. In the interim, lead agencies and project proponents still have to assess project impacts on a case by case basis.
- There is a lack of information to establish numerical thresholds based on scientific information.
- Qualitative assessments should be, based in part, on compliance with established GHG emission reductions targets such as those established in AB32 or SB375, or approved performance standards.
- Because a project is not subject to CEQA does not necessarily means that it is not subject to AB32.
- A qualitative approach could be fashioned similar to the Indirect Source Review (ISR) approach.

Metrics to Consider in Establishing a Quantitative or Qualitative Threshold

5. *What metrics should be considered in establishing a quantitative threshold?*
6. *What metrics should be considered in establishing a qualitative significance threshold?*

In addition to the above concepts, the subcommittee discussed establishing a quantitative threshold for residential developments in which project related GHG emissions would be compared to a per capita threshold, or other unit to be determined, i.e. square foot, etc. This concept could be consistent with implementation of SB375.

The subcommittee gave significant time to discussing the availability of validated scientific information that could be used to establish project specific quantitative thresholds. Certain committee members share the opinion that there is compelling information demonstrating that any increase in GHG emissions has a significant impact on global climatic change. However, other committee members share the opinion that the existing scientific information is insufficient to support establishing project specific significance thresholds.

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee
May 5, 2009

Appendix B

Agency Review & Activities:

Office of Planning and Research

This memorandum summarizes the relevant OPR CEQA guideline revisions that may impact the District's quest to define significant GHG impacts. Of most importance is the new Guideline section 15064.4 that describes significant GHG impacts, section 15126.4 concerning mitigating GHG impacts and the minor changes to Appendix G the initial study form.

In summary (these are set out in more detail below), the following are the main factors that the OPR draft uses to measure significance:

1) Exceedance of thresholds;
2) Emissions calculated and compared to a threshold, qualitative, or performance-based standards [for editorial additions, see reference 15064.4 (b) (4)];
3) Other agency thresholds can be used to set levels;
4) Increase or decrease in energy use/efficiency (not clear whether local or regional); and
5) Projects impact on attainment to AB 32 goals.

The OPR document consists of some introductory comments and draft revisions to the guidelines that relate to Greenhouse gases. This Summary just discusses the more significant sections.

1. The document indicates in the introduction that OPR intends to rely on CARB to recommend a method for setting significance thresholds.
2. The draft guidelines add a new section 15064.4 titled "Determining the Significance of GHG Emissions", and it includes a suggestion of situations that might be considered significant. A project may be significant to the extent that it:
    a. Helps or hinders the attainment of GHG emission goals;
    b. The extent to an increase or decrease in consumption of fuels or other energy resources (especially fossil fuels);
    c. May result in increased efficiency with respect to GHG emissions;
    d. Exceeds a threshold of significance;
    e. This section also includes a provision that the Lead agency must make its own "good faith" effort to actually calculate the level of GHG emissions "including emissions associated with energy

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee
May 5, 2009

consumption"; using a model or methodology; and relies on qualitative or other performance based standards for estimating the significance of greenhouse gas emissions.

Other relevant sections:

1. 15064.7(c) which offers little guidance in setting thresholds of significance, but notes that lead agencies may consider thresholds set by other agencies;
2. 15093(d) which discusses overriding consideration indicates that local projects can be approved with significant effects if there are region-wide or statewide benefits;
3. 15126.4(c) which adds "Mitigation Measures Related to Greenhouse Gases" including energy consumption mitigation measures;
4. 15150(b)(1)(B) which encourages reliance on other EIRs that discuss greenhouse gases;
5. 15152(i) which encourages tiering from other EIRs;
6. 15130(b)(1)(B) which allows agency to use summary of projections in cumulative impacts discussion based on EIRs for other local and regional plans; and
7. 15130(f) whose cumulative impacts may be significant.
8. Adds to Appendix – which identifies potential significant effects and whether an EIR is required, contains sections regarding GHG impacts on forestry, emphasizes Vehicle Miles Traveled (VMT) and de-emphasizes Level of Service (LOS) in the Transportation/Traffic section, and adds general greenhouse gas impacts that would trigger the potential to be significant as follows:

   GREENHOUSE GAS EMISSIONS
   Would the project:
   1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment, based on any applicable threshold of significance?
   2. Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?

   CONCLUSION
   Most of these provisions are logical extensions of the CEQA process. The difficulty will be determining emissions and setting numerical thresholds which are not resolved herein.

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee

Appendix C

Agency Review & Activities:

California Energy Commission

The California Energy Commission (CEC) is the lead agency for power plant siting under California law, and has licensing authority for all thermal power plants with capacity of 50 MW or more that are proposed for construction within the state. The CEC's licensing process, which includes extensive environmental impact review, has been certified as the functional equivalent of the CEQA environmental impact review (EIR) process. Traditionally, the CEC EIR has used a "no cumulative impact" argument in response to GHG emissions. CEC staff feel confident in this assessment in light of the fact that new, cleaner power plants will displace energy needed from marginal, older, "dirtier" power plants, causing a net decrease in the system-wide GHG emissions. So, as long as there are "dirty" plants and plants that run less efficiently than new plants, the displacement argument holds.

However, in response to ARB's Scoping Plan and anticipated implementation of AB 32, CEC staff and the CEC are taking a closer look at how they deal with GHG in their EIR findings. The Siting Committee held two workshops[74] in October and November in and accepted subsequent written comment, to discuss conceptual interim approaches for evaluating GHG emissions from new power plants. Potential threshold approaches were discussed amongst committee members, staff, industry representatives and environmental representatives including:

Zero threshold - mitigation for all projects;
System threshold - mitigation for some projects;
System/local-reliability-areas (LRA) threshold - mitigation based on LRA; and
"Best available control technology" - mitigation by technology.

Most of the discussion bounced between the zero-threshold (environmental representatives) and the system-threshold (industry representatives). Several of the industry representatives stated that they are already mitigating by applying best available control technology whenever possible. By the end of the discussion, the Siting Committee directed staff to conduct (actually, a consultant will conduct) a Generic System Analysis to understand the implications of changes to the energy system upon the addition of a new power plant. This analysis is due back to staff in February or March for internal review. It is

[74] The transcript and other documents from this workshop are available at http://www.energy.ca.gov/ghg_powerplants/documents/

possible that this general analysis may be used programmatically for future EIR analyses for new power plants, but at this point it is unclear.

Agency Review & Activities:

ARB Preliminary Guidelines Significance Standards

Framework of ARB's Preliminary Proposal for GHG Significance Levels

The Preliminary Proposal proposes guidelines for residential, commercial and industrial projects. A residential or commercial project is categorized as a project that is either: 1) statutorily or categorically exempt; 2) less than significant because it complies with either a previously approved CEQA-compliant programmatic document or a combination of quantitative and performance standards; or 3) significant and requiring preparation of an EIR. An industrial project may also be either 1) categorically or statutorily exempt, or; 2) meet a combination of quantitative and performance standard thresholds to achieve a less than significant CEQA status.

Please see attached flow charts from ARB's preliminary proposal.

Agency Review & Activities:

CAPCOA Recommendations

Industrial Sources

CAPCOA supports a bifurcated approach to CEQA review and mitigation for industrial emission sources, as follows:

1. Require all new industrial sources of GHG emissions to meet specific GHG performance standards established for each equipment type or source category of emissions. Additionally, any new industrial source exceeding 25,000 tons of CO_2E per year after meeting the specified performance standards would be deemed to have a potentially significant adverse impact on the environment and would be analyzed and mitigated as required under CEQA.

OR

2. A jurisdiction could establish a CEQA significance threshold for industrial sources designed to capture and mitigate 90% of industrial source emissions. All new industrial sources exceeding the established threshold would be considered significant and subject to CEQA review and mitigation. Industrial sources with GHG emissions below the threshold would not be subject to performance standards and would not require mitigation or CEQA review for GHG impacts.

CAPCOA believes each option would be functionally equivalent in the level of GHG emission reductions achieved from new industrial source projects. The bifurcated approach allows lead agencies the flexibility to choose the type of CEQA threshold best suited to their local review process for industrial projects proposed within their jurisdiction.

Residential and Commercial Projects:

CAPCOA has not yet reached consensus on a recommended approach regarding CEQA thresholds for residential and commercial projects.

Summary of Written Comments Received

Written comments pertaining to significance levels are summarized below.

1. Gordon Nipp (Kern-Kaweah Chapter of Sierra)

I attach the papers by James Hansen that I see as authoritative. While they won't give the Air District specific guidance on what number to set as a significance threshold under CEQA, they speak to the seriousness of the problem. Of course, under CEQA, the more serious the problem, the lower the threshold. Global warming is perhaps the most serious problem our species has ever faced - hence the call for a zero threshold.

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee
May 5, 2009

2. Thomas A. Umenhofer (Western States Petroleum Association)

It is critical that any CEQA GHG Threshold of Significance be a reasonable, balanced, and equitable approach which harmonizes the requirements of CEQA, AB 32, and SB 375. SJVAPCD staff has identified a representative range of options. At this time, Western States Petroleum Association (WSPA) encourages a "cascade approach with off-ramps". It is understood that current CEQA GHG Threshold of Significance efforts are considered Phase 1 (Technical Workgroup Stakeholder Input) of a multi-phased Climate Change Action Plan (CCAP) process. As the process proceeds into Phase 2 (Development of CEQA Guidance), WSPA believes that the following key points discussed during Phase 1, be carried forward:

- Quantitative (numeric) thresholds for purpose of defining a significant impact of CEQA GHGs pursuant to climate change (a global concern) currently have no scientific basis. In the absence of a legitimate scientific basis, the establishment of quantitative thresholds of significance is problematic and without justification.

- Compliance by individual projects with the provisions of AB 32 (and SB 375), including participation in a cap and trade program, will result in a reduction in state GHG emissions. Accordingly, the net state GHG reductions by definition would result in a net environmental benefit and, therefore, projects which comply with the provisions of AB 32 (and SB 375) should not require additional analysis under CEQA.

- Performance standards do have basis in practice.

- It is anticipated that significant future research and development (R&D) will be necessary in the area of energy efficiency and GHG reduction opportunities pursuant to AB 32. Thresholds of Significance should incorporate flexibility to allow for credit for applying successful new technologies. Without providing a mechanism for crediting future beneficial programs, there will be no incentive for early initiation of key R&D activities.

3. Robert Boston (Berry Petroleum Company)

Berry encourages the enclosed cascade approach very similar to attachments H and J of the District's Climate Change Action Plan (CCAP) and believes the following ideas should be discussed in the development of CEQA guidance process.

Currently available technology does not meet AB-32 required reductions. To meet AB-32, the state must make significant investment in new energy efficiency and GHG reduction research and development (R&D). Significance thresholds need to

Climate Change Action Plan
GHG CEQA Technical Workgroup--Level of Significance Subcommittee
May 5, 2009

credit R&D projects for successful new technologies. New technology cannot replace existing operations until R&D proves the technology. Without crediting new technology for the future impacts, approving R&D projects will require greater expense to mitigate temporary increases, even though the projects will eventually lead to significant reductions. Therefore, unless District significance threshold policy removes the disincentives to GHG reductions and energy efficiency R&D projects, the lead agency will not assure projects conform to all public plans and policy, as required by the Governor's Office of Public Research guidance.

Additionally, individual project that can meet AB-32 required reduction will result in a reduction in sector GHG emissions. Therefore, individual projects in compliance with AB-32 required reduction should not require additional analysis under CEQA.

Qualitative thresholds in the form of performance standards are available in most or all sectors and can be supported from a technical standpoint. Therefore, individual projects in compliance with the qualitative thresholds should not require additional analysis under CEQA.

Currently there is no legitimate scientific basis showing what quantitative thresholds of CEQA GHGs have a significant impact on climate change. Therefore, quantitative thresholds could be used to determine significance when legitimate science is made, but should be considered a minor criterion for determining significance of project.

Climate Change Action Plan
GHG CEQA Technical Workgroup—Mitigation Measures
March 4, 2009

Introduction

Per CEQA Guidelines, when project related impacts exceed a significance threshold the lead agency is required to impose all feasible mitigation measures. Environmental impacts from GHG emissions are global in nature and unlike environmental impacts from criteria pollutants may be mitigated through non-traditional measures. During the Greenhouse Gas (GHG) California Environmental Quality Act (CEQA) Guidance Technical Workgroup meeting an ad hoc committee was formed to provide guidance/recommendations regarding mitigation of project specific GHG emissions during the CEQA environmental review process. To facilitate discussion, the District asked subcommittee members to share their views for addressing the following questions:

Key discussion topics considered by the ad hoc committee include:

7. Should GHG mitigation be geographically limited to measures that occur within the District, within the State of California, or the United States?
8. How would a lead agency evaluate mitigation measures consisting of GHG emission reduction credits purchased from a firm selling carbon credits?
9. How would a lead agency evaluate mitigation measures consisting of GHG emission reduction activities achieved by their company outside the project area?
10. How would a lead agency determine that GHG emissions have been mitigated to less than significant if the significance threshold consists solely of a performance standard?
11. How would a lead agency determine that GHG emissions have been mitigated to less than significant if the significance threshold consists of both a performance standard and a numerical value?

Conference calls were held on February 20 and 25, 2009. The following summarizes the committee's progress.

7. *Should GHG mitigation be geographically limited to measures that occur within the District, within the State of California, or the United States?*

The committee recognizes that mitigation measures which reduce GHG emissions can also have collateral benefits on local air quality, i.e. implementation of solar panels can reduce emissions of criteria pollutants, by reducing fossil fuel consumption. The committee suggests that lead agencies preferentially implement local GHG mitigation measures. However, global climatic change results from the individual and cumulative impacts of project related GHG emissions and any reduction in GHG emissions would serve to mitigate project related global climatic change. The committee acknowledges the need for project proponents to have flexibility to seek the most cost effective measures for reducing project related GHG impacts. The committee does not support geographical limitations on GHG mitigation measures.

Climate Change Action Plan
GHG CEQA Technical Workgroup—Mitigation Measures
March 4, 2009

8. *How would a lead agency evaluate mitigation measures consisting of GHG emission reduction credits purchased from a firm selling carbon credits?*

Carbon credits enable individuals and businesses to mitigate GHG emissions by offsetting, reducing or displacing the GHG emissions in another place, typically where it is more economical to do so. Carbon credits typically include renewable energy, energy efficiency and reforestation projects. Carbon credits can currently be purchased from several businesses, and more are likely to develop to match the demand for carbon credits. A key consideration of the use of carbon credits as mitigation is enforceability. Per CEQA Guidelines §15126.4(a)(2) mitigation measures must be fully enforceable through permit conditions, agreements, or other legally binding instrument. The California Climate Action Registry and The Climate Registry have established lists of organizations to serve as verification bodies, providing GHG verification services. The American National Standards Institute (ANSI) is administering a GHG validation/verification body accreditation entity program under ISO 14065. The committee suggests that lead agencies limit use of carbon credits to credits which have been verified by an accredited organization, or to those accredited by the California Resources Board, or otherwise approved by the District.

9. *How would a lead agency evaluate mitigation measures consisting of GHG emission reduction activities achieved by their company outside the project area?*

The committee acknowledges that larger companies may have facilities outside the project area and can implement corporate-wide GHG reduction measures that could be used to offset project specific emissions. However, the committee acknowledges that it would not be feasible for a lead agency to verify emission reductions that occur outside their jurisdiction. The committee acknowledges that the responsibility for demonstrating adequacy of GHG emission reductions resides with the project proponent. The committee suggests that lead agencies limit mitigation to measures which have been verified by an accredited organization, or to those accredited by the California Resources Board, or otherwise approved by the District. The committee is optimistic that local verification will be more cost effective, thus, encouraging project proponents to initiate local GHG emission reductions.

10. *How would a lead agency determine that GHG emissions have been mitigated to less than significant if the significance threshold consists solely of a performance standard?*

The committee acknowledges that performance standards for development projects may not be as precise as performance standards established for stationary sources subject to air district permit requirements. For development projects, the committee suggests quantification of the emission reductions that would be achieved by a specific element within the performance standard and require mitigation that would

Climate Change Action Plan
GHG CEQA Technical Workgroup—Mitigation Measures
March 4, 2009

achieve an equivalent reduction. For example, if the performance standard was to exceed Title 24 energy requirements by 30 percent and the project proponent exceeded Title 24 by 20 percent, they would be accountable for mitigating the amount of GHG emissions attributable to the 10 percent shortfall.

For stationary source projects subject to performance standards established by the District, ARB, or other applicable government agency, the committee considered compliance with a performance standard mandatory. This concept is consistent with current permitting activities that would require compliance with Best Available Control Technology (BACT).

11. *How would a lead agency determine that GHG emissions have been mitigated to less than significant if the significance threshold consists of both a performance standard and a numerical value?*

Resolution of this question is dependent upon whether the project proponent has the option of complying with either standard, or whether the project proponent must comply with both standards. If the project proponent has the option of complying with either standard and does not meet either standard, then it is plausible that the lead agency has the discretionary authority to require mitigation to the standard of their choice. Determining if the project had been mitigated to less than significant would follow the approach discussed above for development and stationary source projects.

If the project proponent has to comply with both standards, then determining if the project had been mitigated to less than significant would require demonstration that mitigation was equivalent to both standards, using approaches discussed above.

AB 32

1. **Comment:** Expresses no confidence in the 29% reduction laid out in AB32. Strongly feels the 29% was a political compromise to get the legislation passed. Comments included that there is no scientific basis behind the percentage. (CRPE)

   Response: AB32 does not specify a percentage reduction. It requires ARB to adopt a statewide GHG emissions limit to be achieved by 2020. The 29% number was identified in ARB's Scoping Plan (stated as "approximately 30%"). The 29% GHG emissions reduction is based on the emissions difference from the projected 2020 GHG Business-as-usual emissions to the 1990 GHG emissions level as presented in ARB's Scoping Plan. Data collected by ARB in supporting the establishment of the 1990 and 2020 emissions are provided as appendixes to the Scoping Plan and can also be found on ARB's website at http://www.arb.ca.gov/cc/scopingplan/document/scopingplandocument.htm.

2. **Comment:** AB32 states: "Ensure that activities undertaken to comply with regulation not disproportionally impact low income communities. Must consider the potential for direct/indirect and cumulative emission impacts, including localized impacts in communities that are already adversely impacted by air pollution." Strongly advises the District to take a closer look into disadvantaged communities. (EJCCS)

   Response: District's implementation on GHG will be consistent with District's Environmental Justice policy.

<u>Timeline</u>

3. **Comment:** Based on the District's implementation timeline, how will the District comply with OPR's guidance and ARB's guidance as they're made available? (CRPE)

   Response: The District will adjust its guidance, if necessary, to be consistent with rules or regulations that may be adopted.

4. **Comment:** What are other air districts in the state doing? Since the SJVAPCD can't wait for ARB to draft guidance on GHG in CEQA.(EJCCS)

   Response: The staff report presents a summary of what other air districts and agencies are doing to address GHG in regards to CEQA.

<u>Best Performance Standards</u>

5. **Comment:** How will "best performance standards" meet the targets laid out in the Staff Report? (CRPE)

   Response: Chapters 4 and 5 of the current staff report include a discussion about quantification of GHG emission reductions for each Best Performance Standard.

6. **Comment:** What criteria will go into developing best performance standards? Each type of criteria needs to be supported by substantial evidence. (CRPE)

   Response: Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards,

7. **Comment:** If "best performance standards" are adopted, will the District allow local land use agencies to adopt or modify their own lists as well? Because there may be things that a big city can do, and a small city can't. But again, projects need to be given credit. (COF)

Response: CEQA Guidelines clearly give lead agencies the discretion to adopt their own thresholds of significance. The District proposed guidance is offered to assist lead agencies in establishing their own thresholds of significance.

8. **Comment:** Will there be more details on what "best performance standards" are? And how are they developed? (EJ)

   Response: Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards

9. **Comment:** Will there be industry input on developing the best performance standards? (CCG)

   Response: Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards, including the process for public input.

10. **Comment:** There are concerns over the approach that projects meeting Best Performance Standards don't need to quantify GHG emissions. Nothing has been seen to support "not" having to quantify GHG emissions. (LSAA)

    Response: As presented in Chapter 4, GHG emission reductions have been quantified for each Best Performance Standard. Project specific GHG emissions would require quantification if the project does not meet Best Performance Standards, or if an Environmental Impact Report is required for the project.

11. **Comment:** As the District comes up with best performance standards, will the SJVAPCD analyze their estimated quantitative mitigative effects and seek to achieve 29% mitigation from all projects? (SMAQMD)

    Response: Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards, including quantification of GHG emission reductions associated with each proposed Best Performance Standards.

12. **Comment:** Projects that will produce GHG beyond 2020 will need stricter mitigations so that they comply with AB 32 goals for future years. I presume that "Best Performance Standards" would lower GHG impacts at least as much as does conforming to AB 32. (AU)

    Response: Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards, including revision as necessary to be consistent with rules or regulations that may be adopted in the future.

13. **Comment:** BIACC agrees with the District that any CEQA GHG threshold proposal must preserve a lead agency's discretion to consider the context of a particular project when evaluating how best to assess and, if appropriate, mitigate a project's GHG emissions. The staff report also properly recognizes that the baseline for evaluation of a project's GHG impacts is the existing environmental setting. The staff report also properly recognizes that a project's compliance with applicable local, regional or statewide GHG reduction plans is critical to evaluating the project's impacts. As the Office of Planning and Research recognizes in their proposed language for CEQA regulations for GHG, a lead agency's evaluation of a project's impacts on climate change should pay particular attention to a project's contribution towards overall reduction of the state's or region's carbon footprint. (BIACC)

    Response: Support for the District's proposal is noted.

14. **Comment:** We agree that several options exist for establishing qualitative thresholds; however we also note that several of the options listed in the Staff Report are not mutually exclusive. Specifically, evaluating GHG emissions reductions on a per capita per unit basis should be done using a percent reduction compared to business as usual approach. (BIACC)

    Response: Comment noted.

15. **Comment:** We know that the statewide goal of reducing greenhouse gas emissions levels to 1990 levels is "specified in law" through AB32, and constitutes an adopted mitigation plan or program under this Guideline. SB 375 Sustainable Communities Strategies and other applicable local and regional GHG reduction plans will also qualify. (BIACC)

    Response: Comment noted.

16. **Comment:** We generally agree with the approach illustrated in Table 2, under which a project can demonstrate that its' GHG emissions are less than significant if it reduces project emissions 29% below business as usual ("BAU"). (BIACC)

    Response: Support for the District's proposal is noted.

17. **Comment:** We strongly disagree with the conclusion in the narrative staff report, which states that all projects permitted by the District will be required to implement a specific set of best performance standards, regardless of whether a project can separately demonstrate that it complies with an existing GHG reduction plan or that it has reduced GHG emissions reductions goal, which is not supported by existing CEQA statute or case law. Instead, projects that cannot reduce their GHG emissions 29% reduction below BAU should be

given the option to implement best performance standards or demonstrate equivalent reductions. But a single project should not be required to do both for its GHG emissions to be considered less than significant. (BIACC)

Response: The District concurs and has modified the proposed guidance to recognize compliance with an approved GHG emission reduction plan that is supported by a certified CEQA environmental review document. Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards, including demonstration of equivalency.

18. **Comment:** We strongly question the District's authority to require projects, at this time, to achieve GHG emissions reductions beyond a fair share of those contained in AB 32. (BIACC)

    Response: The proposed guidance is consistent with authority granted to lead agencies under CEQA to reduce project related environmental impacts to less than significant by implementation of all feasible mitigation measures,

19. **Comment:** BIACC supports the development of best performance standards as one option for demonstrating less than significant GHG emissions. Furthermore, we believe the District can serve a critical role by acting as a resource or clearinghouse for feasible mitigation measures that project proponents can consider when developing their projects and possible GHG mitigation strategies. (BIACC)

    Response: Support for the District's proposal is noted.

20. **Comment:** BIAD endorses the concept of Best Performance Standards as one method for determining the significance of a project. We agree with the analysis performed by the District in deciding upon BPS as an acceptable methodology and look forward to continuing our work with the District to establish BPS with flexibility and specificity. We also look forward to the District reducing the regulatory burden of this program by streamlining the process as discussed in the workshop on May 5th. We believe it is critical for this streamlining process to take contemporaneously with the adoption of the threshold for level of significance. (BIAD)

    Response: Support for the District's proposal is noted.

21. **Comment:** We appreciate the District's recognition of SB 375 and the Sustainable Community Strategy Plans (SCPS) to be adopted by local agencies. We strongly believe that compliance with SB 375 and a locally adopted SCSP should also stand alone as a determination of significance for GHG under CEQA. (BIAD)

Response: Comment noted.

22. **Comment:** The District on the matter of quantitative reductions for determining level of significance chose to abstain from embracing the analysis used in the initial adoption of AB32. The California Global Warming Solutions Act of 2006 was established with quantitative goals for the state to achieve in 2020 and 2050. The quantitative goals of AB32 were not chosen randomly or arbitrarily but rather based in part on the Kyoto Protocols and extensive scientific studies on global warming. (BIAD)

    Response: The District believes that the proposed guidance and recommendations are consistent with AB32.

23. **Comment:** BIAD supports the quantitative analysis found in AB32 setting the quantitative reduction of GHG at 29% below Business As Usual (BAU) as the proper target to achieve the goals and objectives of AB32. This numeric threshold should, independently and apart from compliances with BPS established by the District or SCSP established by local agencies satisfy the level of significance threshold for GHG under CEQA. (BIAD)

    Response: As presented in the staff report, the District is unaware of scientific data supporting a numerical significance threshold.

24. **Comment:** By allowing a project applicant to choose between three equally valid methods of determining level of significance: 1) compliance with a local, regional or statewide plan to reduce GHG emissions such as a SCSP; 2) reducing project GHG emissions 29% below BAU; or 3) compliance with District adopted BPS, the District will be maintaining a flexible and workable regulatory system in furtherance of the objectives of AB32. BIAD would support regulations allowing a project to be deemed less than significant upon determination they have complied with any one of these three methods. (BIAD)

    Response: The District has modified the proposed guidance to recognize compliance with an approved GHG emission reduction plan that is supported by a certified CEQA environmental review document.

25. **Comment:** The current draft suggests a Best Performance Standard (BPS) approach, but does not specify what is a best performance standard. (CCGGA)

    Response: Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards, including a definition of Best Performance Standards.

26. **Comment:** The District needs to take into account that emissions for all new projects have already been accounted for in ARB 2020 "business as usual" inventory and the Scoping Plan is a feasible mitigation approach. (CCGGA)

    Response: District's proposed process does take into account the emission reductions that have been achieved since the 2002-04 emissions baseline.

27. **Comment:** The District needs to be aware that new facilities and new projects will be subject to a considerable amount of double counting due to overlapping regulations. This will put new facilities at a disadvantage compared with an existing facility. A new facility will have to comply with the Best Performance Standard and then also reduce emissions according to the Cap-and-Trade program. Existing facilities will only have to comply with the Cap-and-Trade. This is yet another reason why ARB Scoping Plan needs to be considered feasible mitigation. (CCGGA)

    Response: The District recognizes that there is the potential for overlap, however, OPR in its proposed amendments to CEQA Guidelines has clarified that compliance with AB32 alone is not sufficient to support a determination of significance.

28. **Comment:** New project's need to have the ability to use offsets in lieu of meeting the yet undefined Best Performance Standard is an important economic factor. We appreciate that the District has added this flexibility into the Climate Change Action Plan and strongly believe that it needs to be preserved. Industries need flexibility and the ability to purchase offsets achieves gives new projects that flexibility. (CCGGA)

    Response: Support for the District's proposal is noted.

29. **Comment:** It was said the District would consider local agencies plan to be a best practice standard, would advice "caution" on that. As all general plans in the Valley have been done, none has had a finding that this is "absolute" best arrangement in land uses/transportation for reducing GHG. Maybe as agencies are asked to amend the land use design and circulation element improvements can be better than what's been adopted, a land use plan shouldn't be considered to be sufficient. (COF)

    Response: The proposed guidance to land use agencies is consistent with amendments to CEQA Guidelines proposed by OPR.

30. **Comment:** Performance standards won't reduce GHG emissions. Each performance standard needs to be measureable. (EJCCS)

Response: Chapters 4 and 5 of the current staff report include a discussion about quantification of GHG emission reductions for each Best Performance Standard.

31. **Comment:** It is important that the District's CEQA guidance does not render moot AB 32's market based systems that could overcome the significant economic feasibility issues of certain dairy manure management projects that could not only reduce GHG emissions but could provide an important source of renewable energy. It is crucially important that the "best performance standards" for dairy operations be established so that the ability of a dairy to voluntarily implement additional projects that could further reduce GHG emissions through a market based cap and trade system is not compromised. (CARES)

    Response: The proposed guidance does not require dairy operators to implement Best Performance Standards. It provides a means for streamlining the significance review process. Project proponents not implementing Best Performance Standards are required to quantify project related GHG emissions and demonstrate that they have reduced or mitigated project related GHG emissions by 29%.

32. **Comment:** If the District establishes "best performance standards," that are in effect requirements to apply mitigation measures, the District essentially requiring a project to implement specified mitigation measures or to otherwise mitigate BAU emission by 29% in order to avoid a significance finding. This would be inconsistent with the intent that the District has emphasized during the working group process. It is also inconsistent with CEQA since a project's impacts must first be determined to be significant before feasibly mitigation may be required. (CARES)

    Response: The proposed guidance does not require implementation of Best Performance Standards. It provides a means for streamlining the significance review process. Project proponents demonstrating that they have reduced or mitigated project related GHG emissions by 29% can conclude that project related impacts are not individually or cumulatively significant. As presented in the staff report, the District believes that a significance determination based on use of performance based standards is consistent with amendments to the CEQA Guidelines proposed by OPR.

33. **Comment:** The District is encouraged to specify Best Performance Standards and quantify the percentage GHG reduction associated with each standard. Such quantification should be supported by substantial evidence. (SC)

    Response: Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards, including quantification of GHG emission reductions for each Best Performance Standard.

Business-As-Usual Emissions

34. **Comment:** The District's plan needs to reveal specific details on "business as usual." (SC)

    Response: Chapter 3 of the current staff report includes a discussion about Business-as-Usual (BAU) that clarifies BAU, as determined by ARB, represents a level of emissions from an emissions category and does not represent operational activities or processes.

35. **Comment:** How does "business as usual" relate to new projects? (EJ)

    Response: Chapter 3 of the current staff report includes a discussion about Business-as-Usual (BAU) that clarifies BAU, as determined by ARB, represents a level of emissions from an emissions category and does not represent operational activities or processes.

36. **Comment:** The District needs to spell out what "business as usual" really is. If not, it will lead to abusive practices among consultants. (SC)

    Response: Chapter 3 of the current staff report includes a discussion about Business-as-Usual (BAU) that clarifies BAU, as determined by ARB, represents a level of emissions from an emissions category and does not represent operational activities or processes.

Greenhouse Gas Reductions

37. **Comment:** Can thoughts be shared on criteria vs. GHG reduction? How to avoid being technology specific? How to avoid double counting? How is the District going to maintain fuel neutrality? (SCGC)

    Response: Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards, including quantification of GHG emission reductions associated with each proposed Best Performance Standards. The proposed guidance is consistent with the District's traditional role of regulating sources of criteria pollutants to protect public health.

38. **Comment:** How will the District approach a project's total emissions? Then assume a 29% reduction, and in relation be able to show the actual project emission reductions. (EJ)

Response: As presented in Chapter 4, project specific GHG emissions would require quantification if the project does not meet Best Performance Standards, or if an Environmental Impact Report is required for the project. The proposed guidance is consistent with CEQA Guidelines proposed by OPR.

39. **Comment:** Anything the District does for providing guidance with GHG in CEQA, needs to be consistent with existing CEQA law. (CRPE)

    Response: The proposed guidance is consistent with CEQA Guidelines proposed by OPR.

40. **Comment:** It is encouraged that the District evaluates real quantifiable emissions and not life cycle emissions that are not quantifiable. (COF)

    Response: OPR has provided clarification that lifecycle quantification is not required. District's policy is consistent with that recommendation.

41. **Comment:** CEQA provides a tool called "Certified Regulatory Program," it allows people to enter a program and be certified to achieving a certain level of reductions. This takes the burden off lead agencies and applicants. (COF)

    Response: The District has modified the proposed guidance to recognize compliance with an approved GHG emission reduction plan that is supported by a certified CEQA environmental review document.

40. **Comment**: Dairy families throughout the San Joaquin Valley will be undertaking significant voluntary efforts to reduce their greenhouse gas emissions in a market based cap and trade system. It is crucially important that the SJVAPCD's guidance does not inadvertently destroy the "voluntariness" of those efforts, and thus the economic feasibility of implementing those projects. (CARES)

    Response: The proposed guidance does not require implementation of Best Performance Standards. It provides a means for streamlining the significance review process. Project proponents demonstrating that they have reduced or mitigated project related GHG emissions by 29% can conclude that project related impacts are not individually and cumulatively significant. As presented in the staff report, the District believes that a significance determination based on use of performance based standards is consistent with amendments to the CEQA Guidelines proposed by OPR.

41. **Comment:** Draft Staff Report contains no argument that the precise 29% value is the cutoff point between feasibility and infeasibility. The 29% cutoff point seems arbitrary. How does the District justify a 29% cutoff point if mitigation beyond that value is feasible? The final plan should include

substantial evidence supporting a specific cutoff point. The District should require reductions of GHG emissions beyond the 29% below BAU requirement in the Climate Change Action Plan. (SC)

Response: As presented in the staff report, existing science is inadequate to support a significance determination based on a precise evaluation of project related GHG emissions. The 29% emission reduction is not arbitrary, but it consistent with the emission reduction target established by ARB in its AB 32 scoping plan, which is consistent with its legislative mandate pursuit to State adoption of AB32.

Miscellaneous

42. **Comment:** Streamlining needs more specifics. In relation, streamlining measures can lead to projects getting tied into litigation. (SC)

    Response: Chapters 4 and 5 of the staff report have been expanded to include additional implementation details. It is the District's intent to develop guidance and tools to streamline the implementation of the process.

43. **Comment:** More time will be needed to review the information as it's made available before the next workshop. (EJ)

    Response: The request is consistent with the District's intent. The goal is to post all documents two weeks prior to the next workshop scheduled for June 30, 2009.

44. **Comments:** Will meeting minutes and participants be made available? (RFMC)

    Response: Available District documents can be found on the Districts website at http://www.valleyair.org/Programs/CCAP/CCAP_idx.htm.

45. **Comments:** What is the definition of a project- New? Existing? Constructing? (RFMC)

    Response: For the proposed guidance, the term "project" has the same meaning as defined in CEQA Guidelines. .

46. **Comments:** Will any new fee be associated with this new GHG in CEQA implementation? (RFMC)

    Response: The proposed guidance is intended to assist the District, lead agencies, and the public in addressing CEQA requirements and it does not propose new fees.

47. **Comments:** For final draft, is a socio-economic analysis going to be performed that will address potential "leakage." (RFMC)

    Response: By law, District staff is required to perform a socioeconomic impact analysis prior to adoption, amendment, or repeal of a rule that has significant air quality benefits or that will strengthen emission limitations. The proposed guidance serves only as recommendations and is not a District rule. Therefore, a socio-economic analysis is not required.

48. **Comment**: The District should consider a tier for industrial projects consistent with the tier for transportation and development projects that allows a project that is consistent with requirements of an approved state, regional or local regulations or plan that includes a GHG analysis. The District should not rule out the possibility that a project's GHG emissions may have an insignificant impact on the environment in the absence of the use of "best performance standards" or 29% emission reductions below BAU. (CARES)

    Response: The District concurs and has modified the proposed guidance to recognize compliance with an approved GHG emission reduction plan that is supported by a certified CEQA environmental review document. Chapters 4 and 5 of the current staff report include a discussion about methodology for developing Best Performance Standards, including demonstration of equivalency.

49. **Comment:** The Draft Staff Report is deficient in that it does not present scientifically based evidence that a project deemed "Less Than Significant" under the regimen presented in Table 2 or Table 3 would not still have a significant effect on global climate change. (SC)

    Response: As presented in the staff report, the existing science is inadequate to support a determination that project specific GHG emissions, regardless of the amount, would or would not have a significant impact on global climatic change. As presented in the current staff report the District has evaluated the various options for determining the significance of project related impacts.

50. **Comment:** Many facets of the Climate Change Action Plan, including the notions of BPS and BAU, are so vague as to invite litigation. Final CCAP should contain specific and precise details. (SC)

    Response: The staff report has been revised to provide additional information regarding BPS and BAU.

Final Draft Staff Report

Appendix I:
Best Performance Standards Stationary Source Projects

Best Performance Standards (BPS) for: GHG Emissions From Stationary Sources		
Emission Unit or Operation	**BPS**	**Approved Alternate Technology**
Fossil Fuel-Fired Boilers, Steam Generators & Process Heaters With Firing Capacity > 5 MMBtu/hour (HHV)	All units shall utilize gaseous fuel only and be appropriately sized and/or have adequate load following capability to avoid the venting of steam to the atmosphere except during emergency situations or during specifically identified and limited maintenance or startup/shutdown operations. In addition, each unit shall meet at least one of the two following criteria: 1. The unit shall be designed for a minimum thermal efficiency of 95 % and shall utilize variable frequency drive electric motor on combustion air/FGR fans or, 2. The unit shall be designed for maximum thermal efficiency by incorporating all of the following design features: a) install adequate heat transfer surface to provide a maximum design approach of 20 oF between the stack gas temperature and the process inlet temperature, b) limit the use of flue gas recirculation (FGR) for NOx control to no more than 10 % , c) minimize excess air in combustion by maintaining a maximum O2 concentration of 3 volume percent in stack gas and d) use variable frequency drive electric motor on combustion air/FGR fans	1. Install equipment utilizing solar energy source in lieu of fossil fuel 2. Obtain GHG emission performance equivalent to BPS by recovery and permanent sequestration of CO_2 from the exhaust of the unit 3. Utilize biogenic fuel derived from natural or waste sources in lieu of fossil fuel (biogenic fuels derived from agricultural operations performed specifically for fuel production do not meet this criteria)
Non-Emergency Flares with rated heat release > 5 MMBtu/hour (HHV)	Combustion shall be performed in an alternate device in lieu of a flare which produces useful energy which would have otherwise been required (utilized as fuel in an engine, boiler, turbine or delivered to a natural gas pipeline, etc.) where the proposed operation is non-emergency. Emergency flares shall utilize a flow-sensing ignition device rather than a continuous pilot and non-GHG purge gas	Obtain GHG emission performance equivalent to BPS by recovery and permanent sequestration of CO_2 from the exhaust of the unit

Emission Unit or Operation	BPS	Approved Alternate Technology
Non-Emergency Onsite Electric Power Generation with Fossil Fuel Combustion > 5 MMBtu/hour Or With Fossil Fuel-Fired Mechanical Driver > 50 bhp	Electric power supply shall be provided solely by a PUC-licensed electric utility in lieu of a fossil fuel-fired unit except for facilities meeting any of the following criteria: 1. Emergency standby power generation, or 2. Power generation from a cogeneration unit	1. Utilize solar energy source in lieu of firing fossil fuels 2. Obtain GHG emission performance equivalent to BPS by recovery and permanent sequestration of CO_2 from the exhaust of the unit 3. Utilize biogenic fuel derived from natural or waste sources in lieu of fossil fuel (biogenic fuels derived from agricultural operations performed specifically for fuel production do not meet this criteria)
Non-Emergency Mechanical Equipment Driver (requirement in lieu of reciprocating IC engines > 50 hp and combustion turbines > 3 MMBtu/hour excluding combustion turbines in cogeneration service)	A non-emergency mechanical equipment driver shall consist of an electric motor, in lieu of a fossil fuel-fired unit, with energy efficiency meeting the efficiency criteria for Premium Efficiency Electric Motors as specified in the National Electrical Manufacturer's Association (NEMA) Standard MG-1 or, upon District approval of submitted documentation which corroborates a claim by the applicant that such electric motor is not feasible, applicant may install a motor with efficiency equal to the maximum available for the proposed class of motor.	1. Power equipment using a renewable energy source such as solar or wind in lieu of fossil fuel 2. Utilize biogenic fuel derived from natural or waste sources in lieu of fossil fuel (biogenic fuels derived from agricultural operations performed specifically for fuel production do not meet this criteria)

Emission Unit or Operation	BPS	Approved Alternate Technology
Fossil Fuel-Fired Cogeneration (combustion turbines > 3 MMBtu/hr or other combustion devices > 5 MMBtu/hour)	Fossil fuel fired cogeneration systems shall be designed to achieve an incremental GHG emission rate not exceeding 700 lb- CO_2 per MWh at the system's design operating point based on power output at the generator terminals, assuming the process thermal demand could alternatively be met by direct fuel firing with 90% thermal efficiency. Heat recovery design shall maximize thermal efficiency by installing adequate heat transfer surface to provide a maximum 20 ^{o}F approach between stack gas temperature and the process inlet temperature	Utilize biogenic fuel derived from renewable natural or waste sources in lieu of fossil fuel (biogenic fuels derived from agricultural operations performed specifically for fuel production do not meet this criteria)
Landfill Operations	Landfills shall comply with CARB Regulation to Reduce Methane Emissions From Municipal Solid Waste Landfills. (www.arb.ca.gov/regact/2009/landfills09/isor.pdf)	None identified
Wastewater Treatment	Wastewater treatment facilities shall incorporate both of the following two control measures: 1. Sludge: Sludge shall be treated anaerobically in digesters, with captured methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment; and 2. Liquid Waste: At least 33% of electricity used for liquid waste aeration shall be derived from renewable energy sources, based on grid power Renewables Portfolio Standard (RPS), and/or supplementation of grid with onsite generation using renewable energy sources such as, but not limited to, biogas, biomass, solar, and wind.	1. Sludge: None identified 2. Liquid Waste: Liquid waste shall be treated anaerobically in digesters or covered ponds, with captured Methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment.

Emission Unit or Operation	BPS	Approved Alternate Technology
Oil And Gas Extraction, Storage, Transportation And Refining Operations	Fugitive Methane emissions shall be minimized by applying VOC Leak Standards, as contained in District Rules 4409 and 4455 to components handling methane	None identified
Direct-Fired Combustion Heat Transfer Equipment (Dryers, Kilns, etc)	Best Performance Standards for this category of equipment will be developed by the District in the future	
Farming Operations –Livestock rearing	All operations shall utilize all three following control measures: 1. All ruminant animal feed shall include at least 6% cottonseed, or, upon District approval, based on sufficient demonstration that use of cottonseed is not feasible, an equivalent substitute; and 2. Manure from animal housing areas for mature cows shall be removed and transferred into appropriate treatment facilities at least four times a day and at least once a day for all other animals; and 3. Collected manure shall be treated anaerobically in digesters or covered lagoons, with captured methane used for energy recovery in a method that displaces current or required fossil fuel use, such as, but not limited to, injection into natural gas pipeline, or powering mobile equipment	None identified.
Farming Operations – Land application of manure	Manure shall be incorporated into soil within 24 hours after application	None identified.

Final Draft Staff Report

Appendix J:
GHG Emission Reduction Measures - Development Projects

GHG Emission Reduction Measures						
MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated*** CO_2 ***Equivalent Point Reductions***	***Measure Description***
<u>Bicycle/Pedestrian/Transit Measures</u>						
1	**Bike parking**	C	M	~	0.625	Non-residential projects provide plentiful short-term and long-term bicycle parking facilities to meet peak season maximum demand. Short term facilities are provided at a minimum ratio of one bike rack space per 20 vehicle spaces. Long-term facilities provide a minimum ratio of one long-term bicycle storage space per 20 **employee** parking spaces.
2	**End of trip facilities**	C	M	~	0.625	Non-residential projects provide "end-of-trip" facilities including showers, lockers, and changing space. Facilities shall be provided in the following ratio: four clothes lockers and one shower provided for every 80 employee parking spaces. For projects with 160 or more employee parking spaces, separate facilities are required for each gender.
3	**Bike parking at multi-unit residential**	~	~	R	0.625	Long-term bicycle parking is provided at apartment complexes or condominiums without garages. Project provides one long-term bicycle parking space for each unit without a garage. Long-term facilities shall consist of one of the following: a bicycle locker, a locked room with standard racks and access limited to bicyclists only, or a standard rack in a location that is staffed and/or monitored by video surveillance 24 hours per day.
4	**Proximity to bike path/bike lanes**	C	M	R	0.625	Entire project is located within 1/2 mile of an existing Class I or Class II bike lane and project design includes a comparable network that connects the project uses to the existing offsite facility. Existing facilities are defined as those facilities that are physically constructed and ready for use prior to the first 20% of the projects occupancy permits being granted. Project design includes a designated bicycle route connecting all units, on-site bicycle parking facilities, offsite bicycle facilities, site entrances, and primary building entrances to existing Class I or Class II bike lane(s) within 1/2 mile. Bicycle route connects to all streets contiguous with project site. Bicycle route has minimum conflicts with automobile parking and circulation facilities. All streets internal to the project wider than 75 feet have class II bicycle lanes on both sides.
5	**Pedestrian network**	C	M	R	1	The project provides a pedestrian access network that internally links all uses and connects to **existing** external streets and pedestrian facilities. Existing facilities are defined as those facilities that are physically constructed and ready for use prior to the first 20% of the projects occupancy permits being granted.

MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated*** CO_2 ***Equivalent Point Reductions***	***Measure Description***
5a	**Pedestrian Network**	C	M	R	0.5	The project provides a pedestrian access network that internally links all uses for connecting to **planned** external streets and pedestrian facilities (facilities must be included pedestrian master plan or equivalent).
6	**Pedestrian barriers minimized**	C	M	R	1	Site design and building placement minimize barriers to pedestrian access and interconnectivity. Physical barriers such as walls, berms, landscaping, and slopes between residential and non-residential uses that impede bicycle or pedestrian circulation are eliminated. Barriers to pedestrian access of neighboring facilities and sites are minimized. This measure is not meant to prevent the limited use of barriers to ensure public safety by prohibiting access to hazardous areas, etc…
7	**Bus shelter for existing transit service**	C	M	R	0.5	Bus or Streetcar service provides headways of one hour or less for stops within 1/4 mile; project provides safe and convenient bicycle/pedestrian access to transit stop(s) and provides essential transit stop improvements (i.e., shelters, route information, benches, and lighting).
8	**Bus shelter for planned transit service**	C	M	R	0.25	Project provides transit stops with safe and convenient bicycle/pedestrian access. Project provides essential transit stop improvements (i.e., shelters, route information, benches, and lighting) in anticipation of future transit service. If measure 7 is selected, it excludes this measure.

MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated*** CO_2 ***Equivalent Point Reductions***	***Measure Description***
9	**Traffic calming**	C	M	R	see table in Measure Description	Project design includes pedestrian/bicycle safety and traffic calming measures in excess of jurisdiction requirements. Roadways are designed to reduce motor vehicle speeds and encourage pedestrian and bicycle trips by featuring traffic calming measures. Traffic calming measures include: bike lanes, center islands, closures (cul-de-sacs), diverters, education, forced turn lanes, roundabouts, speed humps, etc… Percent of Streets with Improvements

		Percent of Streets with Improvements			
		25%	50%	75%	100%

MEASURE #	Measure Name	Commercial	Mixed-Use	Residential	Estimated CO_2 Equivalent Point Reductions	Measure Description
Parking Measures						
10	**Paid parking**	C	M	R	see below	Employee and/or customer paid parking system
10a	**Paid Parking - Urban site within 1/4 mile from transit stop**	C	M	R	5	Employee and/or customer paid parking system. Daily charge for parking must be equal to or greater than the cost of a local transit pass + 20%. Monthly charge for parking must be equal to or greater than the cost of a local monthly transit pass, plus 20%.
10b	**Paid Parking- Urban site greater than 1/4 mile from transit stop**	C	M	R	1.50	Employee and/or customer paid parking system. Daily charge for parking must be equal to or greater than the cost of a local transit pass + 20%. Monthly charge for parking must be equal to or greater than the cost of a local monthly transit pass, plus 20%.
10c	**Paid Parking- Suburban site within 1/4 mile of transit stop**	C	M	R	2	Employee and/or customer paid parking system. Daily charge for parking must be equal to or greater than the cost of a local transit pass + 20%. Monthly charge for parking must be equal to or greater than the cost of a local monthly transit pass, plus 20%.
10d	**Paid Parking- Suburban site greater than 1/4 mile from transit stop**	C	M	R	1	Employee and/or customer paid parking system. Daily charge for parking must be equal to or greater than the cost of a local transit pass + 20%. Monthly charge for parking must be equal to or greater than the cost of a local monthly transit pass, plus 20%.
10e	**Parking cash out**	C	M		0.6	Employer provides employees with a choice of forgoing subsidized parking for a cash payment equivalent to the cost of the parking space to the employer.

MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated*** CO_2 ***Equivalent Point Reductions***	***Measure Description***
11	**Minimum parking**	C	M	R	3	Provide minimum amount of parking required. Special review of parking required. If zoning codes in the San Joaquin Valley area have provisions that allow a project to build less than the typically mandated amount of parking if the development features design elements that reduce the need for automobile use. This measure recognizes the air quality benefit that results when facilities minimize parking needs, and grants mitigation value to project that implement all available parking reductions. Once land uses are determined, the trip reduction factor associated with this measure can be determined by utilizing the Institute of Transportation Engineers (ITE) Parking generation publication. The reduction in trips can be computed as shown below by the ratio of the difference of minimum parking required by code and ITE peak parking demand to ITE peak parking demand for the land uses multiplied by 50%. The maximum achievable trip reduction is 6%. For projects where retail space occupies 50% or more of the total built space, do not use December specific parking generation rates (from ITE). Percent Trip Reduction = 50*[(min parking required by code - ITE peak parking demand) / (ITE peak parking demand)].
12	**Parking reduction beyond code**	C	M	R	6	Provide parking reduction less than code. Special review of parking required. Recommend a Shared Parking strategy. Trip reductions associated with parking reductions beyond code shall be computed in the same manner as described under measure 11, as the same methodology applies. The maximum achievable trip reduction is 12%. This measure can be readily implemented through a Shared Parking strategy, wherein parking is utilized jointly among different land uses, buildings, and facilities in an area that experience peak parking needs at different times of day and day of the week. For example, residential uses and/or restaurant/retail uses, which experience peak parking demand during the evening/night and on the weekends, arrange to share parking facilities with office and/or educational uses, which experience peak demand during business hours and during the week.
13	**Pedestrian pathway through parking**	C	M	R	0.5	Provide a parking lot design that includes clearly marked and shaded pedestrian pathways between transit facilities and building entrances. Pathway must connect to all transit facilities internal or adjacent to project site. Site plan should demonstrate how the pathways are clearly marked, shaded, and are placed between transit facilities and building entrances.

MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated*** CO_2 ***Equivalent Point Reductions***	***Measure Description***
14	**Off street parking**	C	M	R	see below	Parking facilities are not adjacent to street frontage
14a	**Off street parking**	C	M	R	1.5	For 1.5% reduction, parking facilities shall not be sited adjacent to public roads contiguous with project site. Functioning pedestrian entrances to major site uses are located along street frontage. Parking facilities do not restrict pedestrian, bicycle, or transit access from adjoining uses. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, a description of where parking is located relative to the buildings on the site, site plans, maps, or other graphics, which demonstrate the placement of parking facilities behind on-site buildings relative to streets contiguous with the project site. Surrounding uses should be high density or mixed-use, there shall be other adjoining pedestrian and bicycle connections, such as wide sidewalks and bike lanes, and surrounding uses shall also implement measure 15.
14b	**Off street parking**	C	M	R	1	For 1.0% reduction, (parking structures only) proponent must show that parking facilities that face street frontage feature ground floor retail along street frontage. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, a written description of the parking facility and the amount of retail space on the ground floor, site plans, maps, or other graphics demonstrating the placement of retail/commercial space along all street fronts contiguous with parking structure.
14c	**Off street parking**	C	M	R	0.1	For 0.1% reduction, the project is not among high-density or mixed uses, is not connected to pedestrian or bicycle access ways, or is among uses that do not also hide parking. This point value is reflective of the importance that other pedestrian and density measures be in place in order for this measure to be effective.

MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated*** CO_2 ***Equivalent Point Reductions***	***Measure Description***
<u>Site Design Measures</u>						
15	**Office/Mixed-Use proximate to transit**	C	M	~	see below	Mitigation value is based on project density and proximity to transit. Planned transit must be in MTP or RT Master Plan. To count as "existing transit" service must be fully operational prior to the first 20% of the projects occupancy permits being granted. Project must provide safe and convenient pedestrian and bicycle access to all transit stops within 1/4 mile. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, a written description of how the project complies with the measure, a map or graphic depicting the location of the project in relation to the transit stop. Graphic should demonstrate a 1/4 mile radius, arc, from transit and planned pathways and linkages to the transit stop. Proponent shall also provide graphics depicting the size and layout of the building as well as the calculations demonstrating the FAR (floor to area ratio).
15a	**Office/Mixed-Use proximate to <u>Planned Light Rail Transit</u>**	C	M	~	0.4	0.75-1.5 FAR (Floor to Area Ratio)
		C	M	~	0.5	1.5-2.25 FAR (Floor to Area Ratio)
		C	M	~	0.75	2.25 or greater FAR (Floor to Area Ratio)
15b	**Office/Mixed-Use proximate to <u>Planned Bus Rapid Transit</u>**	C	M	~	0.2	0.75-1.5 FAR (Floor to Area Ratio)
		C	M	~	0.25	1.5-2.25 FAR (Floor to Area Ratio)
		C	M	~	0.3	2.25 or greater FAR (Floor to Area Ratio)

MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated*** CO_2 ***Equivalent Point Reductions***	***Measure Description***
15c	**Office/Mixed-Use proximate to Existing Light Rail Transit**	C	M	~	0.75	0.75-1.5 FAR (Floor to Area Ratio)
		C	M	~	1	1.5-2.25 FAR (Floor to Area Ratio)
		C	M	~	1.5	2.25 or greater FAR (Floor to Area Ratio)
15d	**Office/Mixed-Use proximate to Existing Bus Rapid Transit**	C	M	~	0.4	0.75-1.5 FAR (Floor to Area Ratio)
		C	M	~	0.5	1.5-2.25 FAR (Floor to Area Ratio)
		C	M	~	0.75	2.25 or greater FAR (Floor to Area Ratio)
16	**Orientation toward existing transit, bikeway, or pedestrian corridor**	C	M	R	0.5	Project is oriented towards existing transit, bicycle, or pedestrian corridor. Setback distance is minimized. Setback distance between project and adjacent uses is reduced to the minimum allowed under jurisdiction code. Setback distance between different buildings on project site is reduced to the minimum allowed under jurisdiction code. Setbacks between project buildings and sidewalks is reduced to the minimum allowed under jurisdiction code. Buildings are oriented towards street frontage. Primary entrances to buildings are located along public street frontage. Project provides bicycle access to existing bicycle corridor. Project provides access to existing pedestrian corridor. (Cannot get points for both this measure and measure 17)

MEASURE #	Measure Name	Commercial	Mixed-Use	Residential	Estimated CO_2 Equivalent Point Reductions	Measure Description
17	**Orientation toward planned transit, bikeway, or pedestrian corridor**	C	M	~	0.25	Project is oriented towards planned transit, bicycle, or pedestrian corridor. Setback distance is minimized. Planned transit, bicycle or pedestrian corridor must be in the MTP, RT Master Plan, General Plan, or Community Plan. Setback distance between project and existing or planned adjacent uses is minimized or non-existent. Setback distance between different buildings on project site is minimized. Setbacks between project buildings and planned or existing sidewalks are minimized. Buildings are oriented towards existing or planned street frontage. Primary entrances to buildings are located along planned or existing public street frontage. Project provides bicycle access to any planned bicycle corridor(s). Project provides pedestrian access to any planned pedestrian corridor(s).
18	**Residential Density With No Transit**	~	~	R	see below	Project provides high-density residential development. Mitgation value is based on project density with **no transit**. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area.
-	**3-6 Du/acre**	~	~	R	0	Project provides high-density residential development. Mitgation value is based on project density with **no transit**. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area.
-	**7-10 Du/acre**	~	~	R	1	Project provides high-density residential development. Mitgation value is based on project density with **no transit**. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area.

-	**31-40 Du/acre**	~	~	R	7	Project provides high-density residential development. Mitgation value is based on project density and proximity to **existing bus rapid** transit. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area. Existing transit facilities must be within 1/4 mile of project border. Project provides safe and convenient bicycle/pedestrian access to all transit stop(s) within 1/4 mile of project border.
-	**41-50 Du/acre**	~	~	R	9	Project provides high-density residential development. Mitgation value is based on project density and proximity to **existing bus rapid** transit. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area. Existing transit facilities must be within 1/4 mile of project border. Project provides safe and convenient bicycle/pedestrian access to all transit stop(s) within 1/4 mile of project border.
-	**50+ Du/acre**	~	~	R	11	Project provides high-density residential development. Mitgation value is based on project density and proximity to **existing bus rapid** transit. Density is calculated by determining the number of units per acre ("du/acre") within the residential portion of the project's net lot area. Existing transit facilities must be within 1/4 mile of project border. Project provides safe and convenient bicycle/pedestrian access to all transit stop(s) within 1/4 mile of project border.

MEASURE #	Measure Name	Commercial	Mixed-Use	Residential	Estimated CO_2 Equivalent Point Reductions	Measure Description
19	Street grid	C	M	R	1	Multiple and direct street routing (grid style). The measure applies to projects with an internal connectivity factor (CF)>=0.80, and average of 1/4 mile or less between external connections along perimeter of project. [CF=# of intersections / (# of cul-de-sacs + intersections)]
20	Neighborhood Electric Vehicle access	C	M	R	see below	Make physical development consistent with requirements for neighborhood electric vehicles (NEV). Current studies show that for most trips, NEVs do not replace gas,fueled vehicles as the primary vehicle. For the purpose of providing incentives for developers to promote NEV use, assume the percent reductions noted below.
20a	Neighborhood Electric Vehicle access	C	M	R	1.5	For 1.5% reduction, a neighborhood shall have internal NEV connections and connections to other existing NEV networks serving all other types of uses.
20b	Neighborhood Electric Vehicle access	C	M	R	1	For 1.0% reduction, a neighborhood shall have internal and external connections to surrounding neighborhoods.
20c	Neighborhood Electric Vehicle access	C	M	R	0.5	For 0.5% reduction, a neighborhood has internal connections only.
21	Affordable Housing Component	~	~	R	see below	Residential development projects of 5 or more dwelling units provide a deed-restricted low-income housing component on-site (as defined in Ch 22.35 of Sacramento County Ordinance Code) [Developers who pay into In-Lieu Fee Programs are not considered eligible to receive credit for this measure]. Percent reductions shall be calculated according to the following formula: % reduction=% units deed-restricted below the market rate housing *0.04
21a	Affordable Housing Component	~	~	R	0.6	Reductions apply if 15% of units are deed-restricted below the market housing rate.

MEASURE #	*Measure Name*	*Commercial*	*Mixed-Use*	*Residential*	*Estimated CO_2 Equivalent Point Reductions*	*Measure Description*
21b	**Affordable Housing Component**	~	~	R	0.8	Reductions apply if 20% of units are deed-restricted below the market housing rate.
21c	**Affordable Housing Component**	~	~	R	1.2	Reductions apply if 30% of units are deed-restricted below the market housing rate.
21d	**Affordable Housing Component**	~	~	R	1.6	Reductions apply if 40% of units are deed-restricted below the market housing rate.
21e	**Affordable Housing Component**	~	~	R	2	Reductions apply if 50% of units are deed-restricted below the market housing rate.
21f	**Affordable Housing Component**	~	~	R	2.4	Reductions apply if 60% of units are deed-restricted below the market housing rate.
21g	**Affordable Housing Component**	~	~	R	2.8	Reductions apply if 70% of units are deed-restricted below the market housing rate.
21h	**Affordable Housing Component**	~	~	R	3.2	Reductions apply if 80% of units are deed-restricted below the market housing rate.

MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated CO_2 Equivalent Point Reductions***	***Measure Description***
21i	**Affordable Housing Component**	~	~	R	3.6	Reductions apply if 90% of units are deed-restricted below the market housing rate.
21j	**Affordable Housing Component**	~	~	R	4	Reductions apply if 100% of units are deed-restricted below the market housing rate.
Mixed-Use Measures						
22	**Urban Mixed-Use Measure**	~	M	~	see below	Development of projects predominantly characterized by properties on which various uses, such as office, commercial, institutional, and residential are combined in a single building or on a single site in an integrated development project with functional inter-relationships and a coherent physical design. Mitigation points for this measure depend on job to housing ratio.
22a	**Urban Mixed-Use Measure**	~	M	~	3	Reductions apply if the ratio (jobs:houses) is ≥ .5 < 1.0
22b	**Urban Mixed-Use Measure**	~	M	~	6.6	Reductions apply if the ratio (jobs:houses) is ≥ 1 < 1.5
22c	**Urban Mixed-Use Measure**	~	M	~	9	Reductions apply if the ratio (jobs:houses) is ≥ 1.5 < 2.0
22d	**Urban Mixed-Use Measure**	~	M	~	7.29	Reductions apply if the ratio (jobs:houses) is ≥ 2.0 < 2.5

MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated CO_2 Equivalent Point Reductions***	***Measure Description***
22e	**Urban Mixed-Use Measure**	~	M	~	6	Reductions apply if the ratio (jobs:houses) is ≥ 2.5 < 3.0
22f	**Urban Mixed-Use Measure**	~	M	~	5	Reductions apply if the ratio (jobs:houses) is ≥ 3.0< 3.5
22g	**Urban Mixed-Use Measure**	~	M	~	4.2	Reductions apply if the ratio (jobs:houses) is ≥3.5 ≤ 4.0
23	**Suburban mixed-use**	C	M	R	3	Have at least three of the following on site and/or offsite within ¼ mile: Residential Development, Retail Development, Park, Open Space, or Office.
24	**Other mixed-use**	~	M	R	1	All residential units are within ¼ mile of parks, schools or other civic uses.
Building Component Measures						
25	**Energy Star roof**	C	M	R	0.5	Install Energy Star labeled roof materials. Energy star qualified roof products reflect more of the sun's rays, decreasing the amount of heat transferred into a building.
26	**Onsite renewable energy system**	C	M	R	1	Project provides onsite renewable energy system(s).
27	**Exceed title 24**	C	M	R	1	Project Exceeds title 24 requirements by 20%

MEASURE #	***Measure Name***	***Commercial***	***Mixed-Use***	***Residential***	***Estimated CO_2 Equivalent Point Reductions***	***Measure Description***
28	**Solar orientation**	~	~	R	0.5	Orient 75 or more percent of homes and/or buildings to face either north or south (within 30 degrees of North or South). Building design includes roof overhangs that are sufficient to block the high summer sun, but not the lower winter sun, from penetrating south facing windows. Trees, other landscaping features and other buildings are sited in such a way as to maximize shade in the summer and maximize solar access to walls and windows in the winter.
29	**Non-Roof Surfaces**	C	M	R	1	Provide shade (within 5 years) and/or use light-colored/high-albedo materials (reflectance of at least 0.3) and/or open grid pavement for at least 30% of the site's non-roof impervious surfaces, including parking lots, walkways, plazas, etc.; OR place a minimum of 50% of parking spaces underground or covered by structured parking; OR use an open-grid pavement system (less than 50% impervious) for a minimum of 50% of the parking lot area. Unshaded parking lot areas, driveways, fire lanes, and other paved areas have a minimum albedo of .3 or greater
30	**Green Roof**	C	M	R	0.5	Install a vegetated roof that covers at least 50% of roof area. Project should demonstrate detailed graphics depicting the planned roof, detailed information on maintenance requirements for the roof, and the facilities plan for maintaining the roof post construction.
TDM and Misc. Measures						
31	**Electric lawnmower**	~	~	R	1	Provide a complimentary electric lawnmower to each residential buyer

Additional GHG Emission Reduction Measures Requiring Additional Investigation			
1	**Bike Lane Street Design**		Incorporate bicycle lanes and routes into street systems, new subdivisions, and large developments.
2	**Bike & pedestrian design**		Include pedestrian and bicycle-only streets and plazas within developments. Create travel routes that ensure that destinations may be reached conveniently by public transportation, bicycling or walking.
3	**School siting**		Site schools to increase the potential for students to walk and bike to school.
4	**Transit street design**		The project will provide for on-site road and off-site bus turnouts, passenger benches, and shelters as demand and service routes warrant subject to review and approval by local transportation planning agencies.
5	**Site design measures**		Site design to minimize th need for external trips by including services/facilities for day care, banking/ATM, restaurants, vehicle refueling, and shopping.
6	**Other mixed-use**		All residential units are within 1/4 mile of parks, schools or other civic uses.
7	**Mixed-Use**		Include mixed-use, infill, and higher density in development projects to support the reduction of vehicle trips, promote alternatives to individual vehicle travel, and promote efficient delivery of services and goods.
8	**Open Space**		Preserve and create open space and parks. Preserve existing trees, and plant replacement trees at a set ratio.
9	**Natural Gas Stove**		Project features only natural gas or electric stoves in residences.
10	**Solar Design**		Incorporate appropriate passive solar design and solar heaters.
11	**Vehicle Idling**		Limit idling time for commercial vehicles, including delivery and construction vehicles.
12	**Ride Sharing Programs**		Create car sharing programs. Accommodations for such programs include providing parking spaces for the car share vehicles at convenient locations accessible by public transportation.
13	**Shuttle Service**		Provide shuttle service to public transit.

14	**School Bus Services**		Work with the school district to restore or expand school bus services.
15	**Shuttle Bus Services**		Operation of a shuttle bus to shopping, health care, public services sites and other nearby trip attactors to reduce automobile use.
16	**Energy efficient appliances**		Install energy efficient heating and cooling systems, appliances and equipment, and control systems.
17	**Renewable Energy Use**		Install solar, wind, and geothermal power systems and solar hot water heaters. Educate consumers about existing incentives.
18	**Solar Panels in Parking areas**		Install solar panels on carports and over parking areas.
19	**Photovoltaic Roofing Tiles**		Install Photovoltaic roofing tiles for solar power.
20	**Tree Planting**		Protect existing trees and encourage the planting of new trees. Adopt a tree protection and replacement ordinance, e.g., requiring that trees larger than a specified diameter that are removed to accommodate development must be replaced at a set ratio.
21	**Local Farmer's Market**		Project shall dedicate space in a centralized, accessible location for a weekly farmers' market.
22	**Community Gardens**		Project shall dedicate space for community gardens.
23	**Best management practices**		Require best management practices in agriculture and animal operations to reduce emissions, conserve energy and water, and utilize alternative energy sources, including biogas, wind and solar.
24	**Land Use Density**		The project should provide densities of nine units per acre or greater, where allowed by the General Plan and/or Zone Plan, along bus routes and at bus stops to encourage transit use, where feasible.
25	**Zero Emission Infrastructure**		Provide the necessary facilities and infrastructure to encourage the use of low or zero-emission vehicles (e.g., electric vehicle charging facilities and conveniently located alternative fueling stations).
26	**Low carbon fuel incentive program**		Institute a low-carbon fuel vehicle incentive program.

Final Draft Staff Report

Appendix K:
Comments to Responses
(June 30, 2009)

SUMMARY OF SIGNIFICANT COMMENTS RECEIVED FROM WORKSHOP HELD JUNE 30, 2009

Climate Change Action Plan: Addressing Greenhouse Gas Emissions Under the California Environmental Quality Act

Stakeholders providing comments:

- Arthur Unger (AU)
- California Cotton Ginners and Growers Association (CCGGA)
- Center for Biological Diversity (CBD)
- Center on Race, Poverty & the Environment (CRPE)
- City of Fresno (CF)
- Constellation Wines US (CWUS)
- Dairy CARES (DC)
- Dudek (D)
- EarthJustice (EJ)
- Fresno Public Health Department (FPHD)
- Kern County Planning Department (KCPD)
- Kern Oil & Refining Company (KORC)
- Sierra Club (SC)
- Silgan Containers MFG. Corp. (SCMC)
- Southern CA Gas Company (SCGC)
- Vector Environmental, Inc. (VEI)
- Western Agricultural Processors Association (WAPA)
- Western States Petroleum Association (WSPA)
- Western United Dairymen (WUD)

Best Performance Standards (BPS)

1. **Comment:** Focusing on AB32, the proposed threshold ignores the long term emission reductions necessary to stabilize the climate and the relevant environmental objectives from which to derive a threshold of significance for the greenhouse gases. (CBD, EJ,CRPE)

   Response: The GHG emission reduction targets established pursuant to AB32 are legislative mandates based on the state's understanding of climate change and its causes. Attempting to establish significance thresholds based on yet to be established GHG emission reduction targets, or on executive-directive reduction targets established without public process, is speculative and thus outside the technical consideration required by CEQA.

2. **Comment:** The Draft CCAP Report provides no analysis of the emissions BPS do not capture and whether these emissions constitute a cumulatively

significant impact. The Draft CCAP Report does not connect BPS with the attainment of a defined and scientifically based environmental objective. (CBD, EJ, CRPE)

Response: This comment is not correct. The proposed GHG significance determination, and the reductions expected, directly link BPS with the attainment of GHG emission reduction targets legislatively mandated by the State of California.

3. **Comment:** The proposed BPS capture only a portion of the carbon footprint of a particular source. For example, the BPS for livestock rearing focuses only on methane and ignores emissions from vehicle trips, energy use, and water consumption that are also a direct or indirect effect of livestock rearing operations. To property address a project's emissions it is important for a project that is significant to analyze all of its impacts on the environment, including indirect or lifecycle impacts, to the extent possible. Because the BPS focuses on a subset of a project's emissions, it improperly short circuits the full consideration and mitigation of project impacts. (CBD, EJ, CRPE)

   Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes. The District agrees that both direct and indirect source of GHG emissions should be considered when evaluating project specific impacts and when establishing BPS. The staff report has been revised to more clearly reflect consideration of both direct and indirect sources of GHG emissions. However, consistent with OPR's proposed revisions to the CEQA Guidelines lifecycle impacts are not required to be considered when evaluating impacts from project specific GHG emissions.

4. **Comment:** The Staff Report needs to clarify that the BPS are examples only. (KORC, DC, VEI)

   Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance.

5. **Comment:** The proposed guidance doesn't consider the use of renewable fuels as an approved BPS. It is important to recognize that the EPA's Renewable Fuel Standards (RFS) Program and CARB's Low Carbon Fuel Standard (LCFS) require refiners to invest millions of dollars in capital to begin manufacturing renewable and low carbon fuels predicated by Climate Change Program mandates, such as AB32. Kern recommends the BPS for internal combustion engines (gasoline or diesel) should satisfy CEQA project mitigation by fueling the engine on renewable or bio-fuels that meet the specification of either the Federal RFS or the State LCFS programs. (KORC)

   Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance. During the development process of BPS, District plans to involve stakeholders in identifying BPS for each industry sector.

6. **Comment:** In the development of BPS, there should be an option to install an engine that uses a fuel versus electrification and the District should remain fuel neutral. The engine should be the best performing engine for the corresponding fuel type. The requirement of electric as the standard goes beyond the guidance for achieving AB32 greenhouse gas emission reduction goals. (CCGGA)

   Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance. During the development process of BPS, District plans to involve stakeholders in identifying BPS for each industry sector.

7. **Comment:** The District guidance does not include enough flexible alternatives or pathways for determining that a project is less than significant without application of BPS or a 29% reduction from BAU; the District should include additional alternatives in its guidance. (DC)

   Response: This guidance is an evolving document which will be revised in the future as additional approaches become available. Lead agencies maintain the flexibility in providing alternative pathways in demonstrating a less than significant impact.

8. **Comment:** There is a concern that feed cost measures restrict economic feasibility. (WUD)

   Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance. During the development process of BPS, District plans to involve stakeholders in identifying BPS for each industry sector.

9. **Comment:** None of the BPS options identified in the draft guidance (for dairies) are workable and are likely to cause severe and unintended consequences if included in CEQA guidance documents in their present form. Urge the "illustrative examples" be removed pending discussion with stakeholders on whether the BPS policy should even apply to agriculture sources. Thorough stakeholder input is strongly urged prior to the publication of any additional draft guidance in this area. (DC)

   Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance. During the development process of BPS, District plans to involve stakeholders in identifying BPS for each industry sector.

10. **Comment:** If an agricultural source does not take the BPS or 29% reduction pathway, it is not clear how or whether it could establish that its GHG emissions are less than significant, or if there is any such nonzero level of emissions, no matter how small, that could be determined as "less than significant" for CEQA reasons. (DC)

    Response: As presented in the Draft Staff Report, the District has considered the various options for determining significance of project specific GHG emissions and concludes that use of performance based standards is the best approach. However, the methodology may evolve as the science progresses.

11. **Comment:** It is suggested that the definition for BPS be rewritten to eliminate any confusion with the established definition for BACT (under the Clean Air Act) and industry-based, operationally based BPS. The definition should be amended to ensure proper interpretation of the term "Best Performance Standards." (WSPA)

    Response: The Draft Staff Report has been revised to include key definitions, including a definition of BPS.

12. **Comment:** In Section 5.1.2 of the Draft Staff Report, it is suggested that the wording of the second sentence in the paragraph be replaced with this statement: "the District is presenting BPS that are illustrative in nature and for demonstration purposes only. Specific BPS will be developed subsequent to the Board approval of the BPS development process and in cooperation with interested parties". This statement is reflective of the discussion at the workshop (Slide 17) of presentation. (WSPA)

    Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance. During the development process of BPS, District plans to involve stakeholders in identifying BPS for each industry sector.

13. **Comment:** It is requested that the District reassess how the introduction to Section 5.3.3 is written to avoid future misuse of the Draft CCAP Staff Report.

    Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance. During the development process of BPS, District plans to involve stakeholders in identifying BPS for each industry sector.

14. **Comment:** It is suggested that the section on fossil fuel-fired, steam generators and process heaters needs to be completely rewritten to be more

consistent with subsequent sections (in terms of general guidance) and responsive to technological and operational practicalities. (WSPA)

Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance. During the development process of BPS, District plans to involve stakeholders in identifying BPS for each industry sector.

15. **Comment:** Concerned that the BPS process seems to establish outdated technologies or processes as the "baseline" for determining GHG reductions. How much of those 2002-2004 "baseline" technologies/practices would be allowed to be installed/used now? It seems untenable to allow new projects to calculate reductions from a standard that would not be allowed today. (EJ)

    Response: ARB's Scoping Plan projects the 2002-2004 baseline emissions inventory to establish the 2020 Business-As-Usual (BAU) emissions inventory. The Plan estimates that a 29% reduction in GHG emissions from BAU is required to achieve the targeted 1990 emissions level. GHG Emission reductions achieved since the baseline period contribute to achieving the required 29% reduction target and should be considered when evaluating project related GHG emissions as compared to BAU.

16. **Comment;** In section 5.1.4 Process of Establishing Best Performance Standards: the section is seriously flawed and needs to include consideration of "cost effectiveness." A BPS selection process that is based on a listing of all technologically feasible and achieved in practice control technologies without due consideration of cost effectiveness is unacceptable. It is recommended the District conduct a cost-effectiveness and socio-economic impact analysis for this proposed plan. (KORC, SCGC)

    Response: The District acknowledges the recommendation to consider cost effectiveness when establishing BPS. When determining that a particular GHG reduction measure has been achieved-in-practice, the District will consider the extent to which grants or other financial subsidies influence economic feasibility of a specific technology or GHG reduction measure. The Draft Staff Report discussion on establishing BPS has been amended consistent with this position.

17. **Comment:** CWUS is generally supportive of the use of BPS as a CEQA mitigation measure. However, the proposed process for establishing a BPS should include a step for assessing economic feasibility. (CWUS)

    Response: The District acknowledges the recommendation to consider cost effectiveness when establishing BPS. When determining that a particular GHG reduction measure has been achieved-in-practice, the District will consider the extent to which grants or other financial subsidies influence economic feasibility of a specific technology or GHG reduction measure. The

Draft Staff Report discussion on establishing BPS has been amended consistent with this position.

Business as Usual (BAU)

18. **Comment:** Neither SJVAPCD nor any other entity has established meaningful assumptions for measuring BAU for areas like transportation emissions. Does BAU vary from project to project or is it a static concept? Could a project close to a transit claim it is below BAU in comparison to a hypothetical project away from transit? Could a project simply do nothing but take credit for mandated increases in fuel economy as a means to assert it is below BAU? (CBD, EJ, CRPE)

    Response: ARB's Scoping Plan projects the 2002-2004 baseline emissions inventory to establish the 2020 Business-As-Usual (BAU) emissions inventory. BAU, as established by CARB, is a projected emissions inventory for 2020 and does not represent actual business or operational practices generating GHG emissions. Consequently, BAU is a static value that does not vary from project to project within the same GHG emissions category. To translate BAU into an emissions generating activity, the District proposes to establish emission factors per unit of activity, for each class and category, using the 2002-2004 baseline period. During this process, the District will seek stakeholder input.

    Project specific GHG emission reductions would be determined by establishing a GHG emissions factor for the proposed project and comparing it to the emissions factor established for the 2002-2004 baseline period. Projects implementing BPS, or otherwise demonstrating that GHG emissions have been reduced by 29% will be determined to have a less than significant individual and cumulative impact on global climate change.

19. **Comment:** Examining reductions from BAU involves a series of assumptions that can be difficult for the public to scrutinize and evaluate. The purpose of CEQA is to provide information on environmental impacts to decision makers and the public 'in a manner that will be meaningful and useful." Use of a BAU, rather than a simple numerical metric thwarts this fundamental purpose. (CBD, EJ, CRPE)

    Response: As discussed in Response to Comment 18, project specific GHG emissions would be compared to emission factors per unit of activity established per class and category for the baseline period. Additionally, as the Draft Staff Report indicates, development of BPS will include ample opportunity for public involvement. The process of establishing BPS includes advanced quantification of GHG emission reduction effectiveness, which will facilitate, not hinder, the ability of the public to scrutinize and evaluate project related impacts and mitigation measures.

20. **<u>Comment:</u>** There are concerns on accomplishing an 80% GHG emission reduction below 1990 levels by 2050 when only 29% below business as usual levels are recommended and by suggesting that projects built today are already below BAU due to additional regulation passed since the baseline period. (CBD, EJ, CRPE, AU)

Response: The scope of the guidance is based on AB32's goal of meeting the 1990 GHG emissions level by year 2020. The guidance being proposed establishes a process for determining significance of project specific GHG emissions, consistent with the legislatively mandated GHG emission reduction targets.

As presented in the Draft Staff Report, the District has considered the various options for determining significance of project specific GHG emissions and concludes that use of performance based standards is the best approach. However, the methodology may evolve as the science and/or legislation progresses.

21. **<u>Comment:</u>** When does mitigation start for a project? How does a new boiler achieve 29% in relation to "business as usual" (boiler in 2002-2004)? (CF)

Response: As presented in the Draft Staff Report, BAU is a projected emissions inventory, based on the 2002 through 2004 baseline period and is not based on specific operational parameters. The District is proposing that emission reductions achieved since the 2002-2004 be credited towards achieving the targeted 29% reduction in GHG emissions. For the specific example of a new boiler, the actual percent reduction in GHG emissions to be achieved by BPS will be established by the process presented in the Draft Staff Report.

22. **<u>Comment:</u>** In the Rio Bravo Ranch EIR, BAU means building with no mitigation measures whatsoever (pages 5.7-54 through 5.7-56). In order to prevent abuse, BAU should be clearly defined. For example, what mitigation measures should be included in BAU? Is it permissible to include no mitigation measures at all? Should measures that are required under some adopted program be considered mitigation measures or as a part of BAU? (SC)

Response: The Draft Staff Report has been amended to include a definition of BAU to be used in the context of establishing BPS and assessing GHG emission reduction measures. As presented in the Draft Staff Report, BAU is a projected emissions inventory, based on the 2002 through 2004 baseline period and is not based on specific operational parameters. The use of BAU by ARB for establishing GHG emission reduction targets has a different meaning than expressed in the EIR.

As presented in the Draft Staff Report, the District is proposing that all emission reductions achieved since the 2002-2004, including compliance with an adopted program, be credited towards achieving the targeted 29% reduction in GHG emissions.

As presented in the Draft Staff Report, the District has considered the various options for determining significance of project specific GHG emissions and concludes that use of performance based standards is the best approach. However, the methodology may evolve as the science progresses.

Greenhouse Gas Reductions

23. **Comment:** It is important that the District doesn't create GHG requirements which would discourage the voluntary replacement of old equipment with newer technology, just because the reduction is less than the 29% goal identified in the Staff Report. A net reduction should be a net reduction. If a replacement/reconstruction project can satisfy the basic permitting and prohibitory rule requirements for the source category, we want people to continue to propose these projects. (SCMC)

    Response: Implementation of BPS is not expected to discourage voluntary equipment replacement projects. The requirement to meet BPS would only apply to projects resulting in increases in GHG emissions. Therefore, voluntary replacement of older equipment would not require implementation of BPS, unless the project would result in an increase in GHG emissions, as compared to pre-project GHG emission levels.

24. **Comment:** The proposed 29% below BAU ignores the longer term GHG emission reduction targets necessary to reduce the risk of dangerous climate change. The proposed thresholds should be revised to account for scientific data on emission reductions necessary to minimize the risk of dangerous climate change. (CBD, EJ, CRPE)

    Response: The scope of the guidance is based on AB32's goal of meeting the 1990 GHG emissions level by year 2020. The guidance being proposed establishes a process for determining significance of project specific GHG emissions, consistent with the legislatively mandated GHG emission reduction targets.

    As presented in the Draft Staff Report, the District has considered the various options for determining significance of project specific GHG emissions and concludes that use of performance based standards is the best approach. However, the methodology may evolve as the science progresses.

25. **Comment:** The 29% reduction target in the draft CCAP is excessive and economically unachievable considering the only viable control that reduces combustion GHG emissions is to limit fuel usage (e.g., shut down combustion

sources, manufacture less, purchase costly credits, and/or go out of business. (KORC)

Response: The scope of the guidance is based on AB32's goal of meeting the 1990 GHG emissions level by year 2020, but it's important to recognize that for CEQA purposes, its application is limited to projects with GHG emissions increases. The guidance being proposed establishes a process for determining significance of project specific GHG emissions increases, consistent with the legislatively mandated GHG emission reduction targets.

As presented in the Draft Staff Report, the District has considered the various options for determining significance of project specific GHG emissions increases and concludes that use of performance based standards is the best approach. However, the methodology may evolve as the science progresses.

26. Comment: If small projects are allowed to be considered insignificant, how do we know the sum of these small projects will not be cumulatively significant? Could some of these small projects have GHG sources that are exceptionally easy to mitigate? (AU)

Response: Our proposed BPS approach applies to all projects with increases in GHG emissions, so is does not consider small projects to be insignificant.

27. Comment: Based on lead agency experience with the recent Big West Flying J Refinery Expansion, we would recommend that this policy not apply to larger industrial projects as the technology is specific to the industry. GHG emissions reductions can be achieved through changes in operations that cannot always be established ahead of time as best performance standards. (KCPD)

Response: The principal of the proposed approach of determining significance of project specific GHG emissions would apply to all projects subject to CEQA. As presented in the Draft Staff Report, GHG emissions would be quantified for projects requiring preparation of an EIR. For such projects, the significance determination would be based on whether or not it incorporates BPS, or if project specific GHG emissions have been reduced by 29%. However, lead agencies will continue to have the flexibility currently provided under CEQA to exercise discretionary judgment related to imposing feasible mitigation and determining significance.

28. Comment: District stated that projects that do not result in an increase in greenhouse emissions will not be subject to the Climate Change Action Plan (CCAP). However, there is no such provision in the current draft of the CCAP. (VEI)

Response: While it is inherent in the basic concepts of CEQA, the Draft Staff Report has been amended to clarify that projects not resulting in an increase in GHG emissions will be considered to have a less than significant individual and cumulative impact on global climate change.

29. **<u>Comment:</u>** How will GHG reductions be calculated? (VEI)

    Response: GHG emission reductions will be calculated according to methodologies approved by the District. The Draft Staff Report discusses the general concepts of calculating GHG emission reductions. These principals will be applied to establish specific methodologies for each identified class and category of GHG emission source. Additionally, the District will give consideration to methodologies developed by ARB and other agencies with expertise in evaluating GHG emissions.

30. **<u>Comment:</u>** How will the District account for an increase in the number of sources over time, as BPS is currently being achieved? Will reductions be valid or offset by increase in number of sources? (FPHD)

    Response: As presented in the Draft Staff Report, BAU is a projected emissions inventory, based on the 2002 through 2004 baseline period and is not based on specific operational parameters. ARB established the projected emissions inventory with consideration of anticipated growth in the number of GHG emission sources. As illustrated in the Draft Staff Report, the AB 32 projected 29% reduction in GHG emissions, including growth, will meet the 1990 GHG emissions level target.

31. **<u>Comment:</u>** The staff report should include specific details about these existing emission reductions for which a project could be credited. For example, will a project automatically be given credit towards the 29% reduction for Title 24 upgrades since 2004? (SC)

    Response: The Draft Staff Report has been amended to clarify that emission reductions achieved since the 2002 – 2004 baseline period will be credited towards achieving the required 29% reduction in GHG emissions to meet the 1990 emissions level target.

32. **<u>Comment:</u>** Will credit toward the 29% reduction be applied for statewide measures that CARB is responsible for? For example, a significant reduction in passenger and light truck emissions will be achieved with implementation of the Pavley vehicle standards upon EPA approval of the waiver. Similarly, emission reductions will be achieved through more stringent Renewable Portfolio Standards applicable to electric utilities. (D)

    Response: Achieving the GHG emission reduction targets requires a multifaceted approach. Achieved reductions in GHG emissions, regardless of the mechanism, will be credited towards achieving the required 29% reduction in GHG emissions to meet the 1990 emissions level target.

Miscellaneous

33. **Comment:** If a project would not normally be considered subject to CEQA, requirements should not be created which will add CEQA burdens. (SCMC)

    Response: As stated in the Draft Staff Report, projects determined to be exempt from CEQA would not require analysis of project specific GHG emissions and would not require implementation of BPS.

34. **Comment:** The SJVAPCD needs to explain how the cumulative total of the emissions it's not capturing will not have a significant environmental effect. For example, by using a 29% BAU threshold, SJVAPCD is saying that allowing 71% of emissions from all new development to be released into the atmosphere would not have a significant environmental effect. The conclusion is unsupportable given that emissions must be reduced by more than 80% below 1990 levels to avoid dangerous climate change. (CBD, EJ, CRPE)

    Response: The GHG emission reduction targets established pursuant to AB32 are legislative mandates based on the state's understanding of climate change and its causes. Attempting to establish significance thresholds based on yet to be established GHG emission reduction targets, or on executive-directive reduction targets established without public process, is speculative and thus outside the technical consideration required by CEQA.

35. **Comment:** The Draft CCAP Report misleadingly states that "execution of a zero threshold would be difficult or impossible." The best available science most strongly supports a zero threshold. The further a threshold is from zero, the more tenuous the evidence to support a determination that the threshold is effective at meeting the environmental objective of avoiding dangerous climate change. (CBD, EJ, CRPE)

    Response: The District agrees neither with the assertion that the "Draft Staff Report is misleading", nor with the statement that "the best available science most strongly supports a zero threshold". On the contrary, District staff thinks it is impossible, using today's science, to say that any single project has a significant impact on global climate change. The District's rationale for supporting a BPS approach for determining cumulative significance of project specific GHG emissions is clearly presented in the Draft Staff Report: the District has considered the various options for determining significance of project specific GHG emissions and concludes that use of performance based standards is the best approach. However, the methodology may evolve as the science progresses.

36. **Comment:** The commenter believes the District could justify the further use of the Scoping Plan to establish a level of insignificance. For instance, agricultural pumps are not subject to regulation according to the Scoping Plan and therefore that emissions category should be considered insignificant for

GHG CEQA purposes. BPS may work for streamlining permits for larger sources. The standards currently written place a heavy burden on small sources. (CCGGA, WAPA)

Response: The Scoping Plan itself cannot be used as a threshold. During the process of developing BPS, the District will consider the extent to which CARB has developed guidance specific to a given GHG emissions source category.

37. **Comment:** Since tier two projects would not have to mitigate the GHG they generate, it is critical to limit the number and GHG generation of tier two projects. (AU)

Response: The tier approach presented in the Draft Staff Report was part of a discussion of the various options for establishing a process of assessing significance of project specific GHG emissions. As presented Chapter Four, the District is proposing a performance based approach for all projects with increases in greenhouse gases emissions.

38. **Comment:** Why should the bottom of page 70 (in Staff Report) assume that equipment operated during the 2002-2004 baseline emission inventory is assumed to be natural gas-fired IC engine, rather than utility supplied electric power? Without this assumption the 42% net emission reduction can not be achieved. (AU)

Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance. During the development process of BPS, District plans to involve stakeholders in identifying BPS for each industry sector.

39. **Comment:** Incorporating GHG into soil (Staff Report: Page 93) might improve with consultation with soil scientists. Would no till farming or organic farming, sequester more carbon than methods now used in the Valley? (AU)

Response: The Draft Staff Report has been revised to clarify that BPS are presented for illustrative purposes, and should not be used by a lead agency to determine best performance standards for use with our guidance. During the development process of BPS, District plans to involve stakeholders in identifying BPS for each industry sector.

40. **Comment:** It is not appropriate to equate agricultural sources/sinks for GHG emissions with large fossil-fuel combustion sources. A "one-size-fits-all" policy not only is inappropriate but inconsistent with state and federal policies. (DC)

Response: As presented in the Draft Staff Report, the District has considered the various options for determining significance of project specific GHG emissions and concludes that use of performance based standards is the best approach. As proposed, all projects which would result in increased GHG emissions are required to reduce and or mitigate project specific GHG emissions. Although all projects would be required to reduce GHG emissions, BPS is specific to each Category and Class.

41. **Comment:** The guidance and policy should clearly and explicitly state that a project in conformance with an adopted Climate Change Action Plan is considered less than significant and does not contribute to cumulative impacts. (KCPD)

    Response: As presented in the Draft Staff Report projects complying with an approved GHG emission reduction plan or GHG mitigation program, which avoids or substantially reduces GHG emissions within the geographic area in which the project is located would be determined to have a less than significant cumulative impact for GHG emissions. Such plans or programs must be specified in law or approved by the lead agency with jurisdiction over the affected resource and supported by a CEQA compliant environmental review document adopted by the lead agency.

42. **Comment;** Recommend considerations be given to projects that have undergone environmental review where such review included consideration of GHG emissions and the projects were subsequently issued negative declarations or mitigated negative declarations. (VEI)

    Response: Nothing being proposed by the District would change the principals of CEQA. Projects approved by a lead agency and supported by a CEQA compliant environmental assessment would be reviewed consistent with existing CEQA Guidelines and would not be required to implement GHG reduction measures beyond those imposed by the lead agency.

43. **Comment:** With respect to determinations made for projects that have undergone environmental review without consideration of GHG emissions, we recommend that additional review be conducted pursuant to State CEQA Guidelines Section 15164 (Addendums to EIR or Negative Declarations). (VEI)

    Response: Nothing being proposed by the District would change the principals of CEQA. Projects approved by a lead agency and supported by a CEQA compliant environmental assessment would be reviewed consistent with existing CEQA Guidelines, including CEQA Guidelines Section 15164**.**

44. **Comment:** What are the pros & cons of how SB375 and ARB's efforts to draft geographic targets relate to the District's Guidance? (CF)

    Response: In general, geographic targets have the potential benefit of implementing program level VMT reduction measures that relate to transportation and land use planning. The success of these efforts however depends greatly on collaboration among multiple land use and state agencies. However, it is important to note that the light-duty vehicle emissions resulting from development projects complying with plans resulting from SB 375 implementation will be exempt from further CEQA review, and therefore will not be subject to this District proposed guidance.

45. **Comment:** "Achieved in Practice" needs to be addressed, and further discussed in the Staff Report. (CCGGA)

    Response: The Draft Staff Report has been revised to include key definitions, including a definition of "Achieved in Practice".

46. **Comment:** In GHG Banking Staff Report, the District says it will be revising its CEQA policy to address GHG emissions. Is this the policy the District is referring to? If so, when will this revision be subject to CEQA, as mentioned in the response to comments? (EJ)

    Response: The District staff was not able to find the reference to the District CEQA Implementation Policy in GHG Banking Staff Report. However, the "policy" referenced in the District CEQA GHG Guidance Draft Staff Report is actually an internal District procedure for implementing CEQA during the permitting process. If the District's governing Board adopts the proposed GHG significance determination guidance, the internal procedure will be revised to include consideration of GHG emissions. Revision of internal guidance is not subject to CEQA.

47. **Comment:** Biogenic carbon dioxide emitted from combustion or fermentation of biomass should be considered to have net-zero GHG emissions. This clarification could be added to the Section 1.1, *description of carbon dioxide*, and Section 4.3.2, *Process*. Clarifying that biogenic CO_2 is a recycling of carbon, not added CO_2 to the ecosystem, will streamline evaluation of such projects. (CWUS)

    Response: The District recognizes that certain sources of biogenic carbon can be considered to have net-zero GHG emissions. However, the determination that a specific source of biogenic carbon would have net-zero GHG emissions is a complex analysis, which should take into consideration the entire process, including activities which directly or indirectly contribute to total GHG emissions. The determination of whether a specific activity or source of biogenic carbon would be considered carbon neutral will be considered when developing BPS for a specific Class and Category.

Final Draft Staff Report

Appendix L:
Evaluation of BPS Performance for Stationary Source Permitting Projects

Evaluation of BPS Performance for Stationary Source Permitting Projects

ARB in their AB32 Scoping Plan[75] concluded that an overall 29% reduction from BAU 2020 emissions levels was necessary to achieve the targeted 1990 emissions rate, and the District's BPS-based approach to addressing CEQA significance is designed to achieve that level of reductions from new growth in GHG emissions. This appendix is a demonstration that such reductions are achievable through implementation of BPS. The attached table summarizes the theoretical affect of implementing our illustrative example BPS, using a two-year history of permitting actions in the San Joaquin Valley. We have categorized the expected reductions as follows:

Facilities NOT subject to ARB's cap-and-trade program
For facilities not subject to cap-and-trade, calculations of GHG emission reductions are directly based on implementing the District's illustrative example BPS. We examined each permitting project that took place in the past two years in the San Joaquin Valley Air District. For those projects for which we proposed an illustrative example BPS, we theoretically applied the BPS to the project, and analyzed the resulting GHG emissions reduction. The percent reduction for each type of projects is shown, as is the total emissions and total emissions reduction for the type of source.

Facilities subject to ARB's cap-and-trade program
The AB 32 Scoping Plan evaluated a comprehensive array of approaches and tools to achieve the required GHG emission reductions to achieve the 1990 GHG emission levels. ARB concluded that reducing GHG emissions from a wide variety of the largest sources can best be achieved through establishment of a cap-and-trade program. The program would establish a limit or "cap" on total GHG emissions generated by sectors covered by the system. The AB32 Scoping Plan identifies the following four sectors that would be subject to a cap-and-trade program: transportation, electricity, commercial and residential, and industry. ARB has determined that for the four sectors included within the cap-and-trade program overall, annual GHG emissions would be reduced from 512 $MMTCO_2E$ (projected 2020 BAU) to 365 $MMTCO_2E$[76]. This represents a 28.7% reduction in GHG emissions compared to BAU.

$$28.7\%\,\text{Total Reduction} = \frac{512\,\text{MMTCO2e}(2020\,\text{BAU Capped Emissions}) - 365\,\text{MMTCO2e}(2020\,\text{Target Capped Emissions})}{512\,\text{MMTCO2e}(2020\,\text{BAU Capped Emissions})}$$

[75] *Climate Change Proposed Scoping Plan;* P. 21. California Air Resources Board, October 2008
[76] *Climate Change Proposed Scoping Plan;* P. 21. California Air Resources Board, October 2008

Facilities subject to ARB's cap-and-trade program are expected to contribute to the overall 29% GHG emissions cap-and-trade reduction target. For these facilities, since implementation of BPS is required for all emission sources with increased GHG emissions, reductions achieved by implementing BPS will be additive to GHG emission reductions achieved at the facility level under the cap-and-trade program. However, per the District's proposed guidance, projects complying with a GHG emissions reduction program approved by the lead agency with jurisdiction over the affected resource and supported by a CEQA compliant environmental review document would be considered to have a less than significant individual and cumulative impact on global climate change. Such projects would not be required to implement BPS. To ensure that the District's estimates of total GHG emission reductions that would be achieved through implementation of BPS are conservative, District staff has assumed for the purposes of this analysis only that the approved cap-and-trade program will have been specified in law or otherwise supported by a CEQA compliant environmental review document such that GHG impacts from projects in these cap-and-trade categories will be considered to have a less than significant individual and cumulative impact on global climate change. Therefore, for projects occurring at facilities belonging to sectors subject to the cap-and-trade program, emission reductions achieved through implementing BPS have been calculated as above, but are not added to the overall 28.7% reduction achieved through compliance with cap-and-trade. For these facilities, the District conservatively limits GHG emission reduction estimates to the 28.7% cumulative reduction that will be achieved through compliance with cap-and-trade provisions.

Overall GHG Emission Reductions

As presented in Table 1, implementing BPS will achieve an overall 34.0% reduction in GHG emissions, thus demonstrating that implementing BPS, even excluding the affects of BPS on Cap-and-Trade sources, exceeds the overall 29% GHG emission reduction targeted by ARB in the scoping plan.

Table 1: GHG Emission Reductions

GHG Emission Reductions Due to Combined Implementation of Illustrative Examples of Best Performance Standards (BPS) and Cap-and-Trade Program for District Projects During 2007 and 2008

BPS Category	GHG Emissions Increases Due to New Unts (tons-CO2/yr)	GHG Emission Increases Due to Modifications (tons-CO2/yr)	Total GHG Emissions Increase (tons-CO2/yr)	Evaluated Total GHG Reductions Due to BPS (tons-CO2/yr)	Cap & Trade Emission Reduction (tons-CO2/yr)	Percent GHG Emissions Reductions Due to BPS Only	Percentage Emission Reduction Due to Combined Cap & Trade Plus BPS
Facilities Not Subject to Cap & Trade							
Boilers, Process Heater and Steam Generators > 5MMBtu/hour	244,111	43,836	287,947	19,590	0.0%	6.8%	6.8%
Non-Emergency Flares > 5 MMBtu/hr	15,548	97,487	113,035	50,325	0.0%	44.5%	44.5%
Non-Emergency Onsite Electric Power Generation with Fossil Fuel Combustion > 5 MMBtu/hr of with Fossil Fuel Fired Mechanical Driver > 50 hp	13,472	0	13,472	8,892	0.0%	66.0%	66.0%
Non-Emergency Mechanical Equipment Driver	94,045	2,269	96,314	65,289	0.0%	67.8%	67.8%
Fossil Fuel-Fired Cogeneration (combustion turbines > 3 MMBtu/hr or other combustion devices > 5 MMBtu/hr)	27,606	0	27,606	6,625	0.0%	24.0%	24.0%
Landfill Operations	0	183	183	7,508	0.0%	4102.7%	4102.7%
Wastewater Treatment Operations	0	0	0	0	0.0%	0.0%	0.0%
Oil and Gas Extraction, Storage, Transportation and Refining Operations (fugitive emissions)	9	46,901	46,910	69,359	0.0%	147.9%	147.9%
Farming Operations - Livestock Rearing	654,382	87,820	742,202	336,557	0.0%	45.3%	45.3%
Farming Operations - Application of Manure to Cropland	0	0	0	0	0.0%	0.0%	0.0%
Facilities Subject to Cap & Trade							
Boilers, Process Heater and Steam Generators > 5MMBtu/hour	1,527,074	300,791	1,827,865	117,593	612,149	6.4%	28.7%
Flares	24,387	224,095	248,482	94,240		37.9%	
Non-Emergency Onsite Electric Power Generation with Fossil Fuel Combustion > 5 MMBtu/hr of with Fossil Fuel Fired Mechanical Driver > 50 hp	0	0	0	0		0.0%	
Non-Emergency Mechanical Equipment Driver	1,135	0	1,135	749		66.0%	
Fossil Fuel-Fired Cogeneration (combustion turbines > 3 MMBtu/hr or other combustion devices > 5 MMBtu/hr)	55,440	0	55,440	13,306		24.0%	
Total Impact of BPS and Cap-and-Trade	**2,657,209**	**803,382**	**3,460,591**	**790,033**	**612,149**	**34.0%**	

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
Bicycle/Pedestrian/Transit Measures									
1	**Bike parking**	C,M	0.625	**Non-residential projects provide plentiful short-term and long-term bicycle parking facilities to meet peak season maximum demand**	0.625	0.946	0.5915464	general	As a rule of thumb, the Center for Clean Air Policy (CCAP) guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 1/4 of that for this measure alone. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
2	**End of trip facilities**	C,M	0.625	**Non-residential projects provide "end-of-trip" facilities including showers, lockers, and changing space**	0.625	0.946	0.5915464	general	The Transportation Demand Management (TDM) Encyclopedia allows a 2-5% reduction for worksite showers ad lockers. The CCAP guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 1/4 of that for this measure alone. Source: TDM Encyclopedia May 11, 2006; CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
3	**Bike parking at multi-unit residential**	R	0.625	**Long-term bicycle parking is provided at apartment complexes or condominiums without garages**	0.625	0.946	0.5915464	general	As a rule of thumb, the CCAP guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 25% of that for this measure alone. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

4	**Proximity to bike path/bike lanes**	R,C,M	0.625	**Entire project is located within 1/2 mile of an existing Class I or Class II bike lane and project design includes a comparable network that connects the project uses to the existing offsite facility**	0.625	0.946	0.5915464	general	As a rule of thumb, the CCAP guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 1/4 of that for this measure alone. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
5	**Pedestrian network**	R,C,M	1	**The project provides a pedestrian access network that internally links all uses and connects to all existing or planned external streets and pedestrian facilities contiguous with the project site.**	1.0	0.946	0.9464742	general	Because this measure also eliminates physical barriers between residential and non-residential uses that impede bicycle or pedestrian circulation, this measure is similar in nature to 6. As cited in the TIAX report, the CCAP guidebook attributes a 1% reduction in VMT. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
6	**Pedestrian barriers minimized**	R,C, M	1	**Site design and building placement minimize barriers to pedestrian access and interconnectivity. Physical barriers such as walls, berms, landscaping, and slopes between residential and non-residential uses that impede bicycle or pedestrian circulation are eliminated**	1.0	0.946	0.9464742	general	The reduction is based on the TIAX report, which indicates a 1% reduction, and the CCAP report, which attributes a 1% to 5% reduction. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
7	**Bus shelter for existing transit service**	R,C,M	.25-1.0	**Bus or Streetcar service provides headways of one hour or less for stops within 1/4 mile; project provides safe and convenient bicycle/pedestrian access to transit stop(s) and provides essential transit stop improvements (i.e., shelters, route information, benches, and lighting).**	0.5	0.946	0.4732371	general	This reduction is based on the assumption that the measure applies to providing bus stop route information & benches. Emission reductions are based on conclusion obtained from the TIAX report and the CCAP guidebook. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
8	**Bus shelter for planned transit service**	R,C,M	0.25	**Project provides transit stops with safe and convenient bicycle/pedestrian access. Project provides essential transit stop improvements (i.e., shelters, route information, benches, and lighting) in anticipation of future transit service**	0.5	0.946	0.4732371	general	This reduction is based on the assumption that the measure applies to providing bus stop route information & benches. Emission reductions are based on conclusion obtained from the TIAX report and the CCAP guidebook. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
9	**Traffic calming**	R,C,M	0.25-1.0	**Project design includes pedestrian/bicycle safety and traffic calming measures in excess of jurisdiction requirements. Roadways are designed to reduce motor vehicle speeds and encourage pedestrian and bicycle trips by featuring traffic calming features**	see table	0.946	see table*SF	general	SMAQMD appears to have the best information available as reflected in their Guidance for Land Use Emission Reductions, which allocates reductions by the percent of intersections with traffic calming improvements as indicated in the table below. We were unable to locate more specific information. Source: Draft Update to SMAQMD Guidance for Land Use Emission Reductions.
Parking Measures									
10a	**Paid parking**	R,C,M	1.0-7.2	**Employee and/or customer paid parking system**	see table	0.946	see table*SF	general	Shoupe, 2005. Parking Cash Out. [$5/day reduces drive-alone share by 21% for commuters to downtown LA, with elasticity of -0.18 (e.g., if price increases 10%, then solo driving goes down by 1.8% more (Wilson 1991)] [Reported 1-10% reduction in trips to central city sites, and 2-4% in suburban sites (Urban Institute)].

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
10b	**Parking cash out**	C, M	0.6-4.5	**Employer provides employees with a choice of forgoing subsidized parking for a cash payment equivalent to the cost of the parking space to the employer**	see table	0.946	see table*SF	specific	Shoupe, 2005. Parking Cash Out. [2/3 as effective as charging for parking (8 case studies - chapter 4, 13% reduction in solo driver trips, -12% VMT per employee, and -11% in vehicle trips per commuter)].
11	**Minimum parking**	R,C,M	0.1-6.0	**Provide minimum amount of parking required. Special review of parking required.**	see formula	0.946	see formula *SF	general	Nelson/Nygaard, 2005. pg. 16. (trip reduction = ((actual parking provision - ITE parking generation rate) / ITE parking generation rate) *0.5). (Note: this formula is not verbatim from that cited in the Nelson/Nygaard document, since the formula provided did not make sense for computing trip reductions. This is what EDAW believes was meant, and this method actually works.)
12	**Parking reduction beyond code**	R,C,M	2.5	**Provide parking reduction less than code. Special review of parking required. Recommend a Shared Parking strategy.**	see formula	0.946	see formula *SF	general	Nelson/Nygaard, 2005. pg. 16. (trip reduction = ((actual parking provision - ITE parking generation rate) / ITE parking generation rate) *0.5). (Note: this formula is not verbatim from that cited in the Nelson/Nygaard document, since the formula provided did not make sense for computing trip reductions. This is what EDAW believes was meant, and this method actually works.)

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
13	**Pedestrian pathway through parking**	R,C,M	0.5	**Provide a parking lot design that includes clearly marked and shaded pedestrian pathways between transit facilities and building entrances**	0.5	0.946	0.4732371	general	The CCAP guidebook attributes between 1% and 4% reduction from all pedestrian measures. There is no specific information related to providing shaded pedestrian pathways between transit facilities and building entrances. It could be said that providing covered carpool/vanpool spaces near the entrance to the buildings has the similar goal of increasing the comfort of the user while walking to the building entrance. The TIAX report assigns a 1% reduction to the covered carpool measure. Transit usage is most affected by the headway times and the proximity to the destination. Therefore, it would seem reasonable to assume .5% Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by Tax on behalf of SMAQMD.
14	**Off street parking**	R,C,M	0.1-1.5	**Parking facilities are not adjacent to street frontage**	0.1-1.5	0.946	0.095-1.419	moderate	No empirical support for this specific measure; however, range of values is based on other pedestrian-oriented measures. The range recognizes the dependence of this measure on other measures. To be awarded 1.0 points, development must be in an area with density, wide sidewalks, and where other uses are also hiding parking. The efficacy of this measure is reduced to 0.1 if the development does not include other pedestrian and mixed-use measures. Parking structure with ground-floor retail is awarded 0.5.
Site Design measures									
15	**Office/Mixed-use density**	C, M	0.1-1.5	**Project provides high density office or mixed-use proximate to transit**	see table	0.946	see table*SF	moderate	No empirical support for this measure, beyond that provided by SMAQMD in its draft guidance. According to Nelson/Nygaard, 2005, trip generation at the non-residential end is influenced by density to a much lesser degree, so this is fairly consistent with the transit reductions applied in measure 20.

SMAQMD MEASURE #	***Measure Name***	***Land Use Type***	***SMAQMD Point Reductions***	***Measure Description***	***Unscaled %CO2 Emission Reduction***	***CO2 Emissions Scale Factors (SF)***	***Scaled % CO2 Emission Reduction***	***Measure Applicability (specific/ moderate/ or general basis)***	***Reduction Methodology and Source***
16	**Orientation toward existing transit, bikeway, or pedestrian corridor**	R,C,M	0.5	**Project is oriented towards existing transit, bicycle, or pedestrian corridor. Setback distance is minimized**	0.5	0.946	0.4732371	general	The CCAP guidebook attribute a 0.5% reduction per 1% improvement in transit frequency. Based on a case study presented in the CCAP report, a 10% increase in transit rider ship would result in a 0.5% reduction. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by Tax on behalf of SMAQMD.
17	**Orientation toward planned transit, bikeway, or pedestrian corridor**	C, M	0.25	**Project is oriented towards planned transit, bicycle, or pedestrian corridor. Setback distance is minimized**	0.5	0.946	0.4732371	moderate	The CCAP guidebook attributes a 0.5 % reduction per 1% improvement in transit frequency. Based on a case study presented in the CCAP report, a 10% increase in transit rider ship would result in a 0.5% reduction. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by Tax on behalf of SMAQMD.
18	**Residential density**	R	1.0-12	**Project provides high-density residential development**	see table	0.946	see table*EF	moderate	Nelson/Nygaard, 2005. pg 11. (trip reduction = 0.6*(1-(19749*((4.814+households per residential acre)/(4.814+7.14))^-.639)/25914) (Holtzclaw et al 2002). Asymptote of 60% reduction. **Relative to a 3 du/ac development.** Note that there is no direct empirical support for the added reductions for proximity to transit; the 60% asymptote in this equation is to correct for double-counting from transit services, mix-of-uses, and bicycle and pedestrian connections (which could contribute another 40% reduction).
19	**Street grid**	R, C, M	1	**Multiple and direct street routing (grid style)**	1.0	0.946	0.9464742	specific	Reductions are based on CCAP estimates for similar measures. Source: CCAP Transportation Emission Guidebook.

SMAQMD MEASURE #	*Measure Name*	*Land Use Type*	*SMAQMD Point Reductions*	*Measure Description*	*Unscaled %CO2 Emission Reduction*	*CO2 Emissions Scale Factors (SF)*	*Scaled % CO2 Emission Reduction*	*Measure Applicability (specific/ moderate/ or general basis)*	*Reduction Methodology and Source*
20	**Neighborhood Electric Vehicle access**	R,C,M	0.5-1.5	**Make physical development consistent with requirements for neighborhood electric vehicles**	0.5-1.5	0.946	0.473-1.419	specific	No direct empirical support for this measure available. May not be relevant/applicable in the near term, until NEVs become more common/inexpensive. Current studies show that for most trips, NEVs do not replace gas-fueled vehicles as the primary vehicle. For the purposes of providing incentives for developers to promote NEV use, assume that a neighborhood with internal NEV connections only receives 0.5 points, with external connections to other surrounding uses, 1.0 point, with external connections to other NEV networks, 1.5 points.
21	**Affordable Housing Component**	R	0.6-4.0	**Residential development projects of 5 or more dwelling units provide a deed-restricted low-income housing component on-site (as defined in Ch 22.35 of Sacramento County Ordinance Code) [Developers who pay into In-Lieu Fee Programs are not considered eligible to receive credit for this measure]**	0.6-4.0	0.946	0.568-3.784	general	Nelson/Nygaard, 2005. pg. 15. (trip reduction = % units deed-restricted below market rate housing * 0.04).
Mixed-use measures									
22	**Urban mixed-use**	M	3.0-9.0	**Development of projects predominantly characterized by properties on which various uses, such as office, commercial, institutional, and residential, are combined in a single building or on a single site in an integrated development project with functional interrelationships and a coherent physical design**	3.0-9.0	0.946	2.838-8.514	general	Nelson/Nygaard, 2005. pg. 12. (trip reduction = (1-(ABS(1.5*h-e)/(1.5*h+e))-0.25)/0.25*0.03) where h = study area housing units, e = study area employment (Criteron & Fehr & Peers, 2001). Asymptote of 9% reduction, and an ideal 1.5 jobs per household.

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
23	**Suburban mixed-use**	R,C,M	3	**Have at least three of the following on site and/or offsite within ¼ mile: Residential Development, Retail Development, Park, Open Space, or Office**	3.0	0.946	2.8394227	moderate	By definition, this type of land use implies that housing availability is greater than employment availability. On a project-by-project basis, use formula :Nelson/Nygaard, 2005. pg. 12. (trip reduction = (1-(ABS(1.5*h-e)/(1.5*h+e))-0.25)/0.25*0.03) where h = study area housing units, e = study area employment (Criteron & Fehr & Peers, 2001) to obtain higher than 3% reduction. Otherwise, assume 3% max reduction.
24	**Other mixed-use**	R, M	1	**All residential units are within ¼ mile of parks, schools or other civic uses.**	1.0	0.946	0.9464742	moderate	This measure has less to do with employment/housing balance. No empirical support for this measure, but logic from measures 24 and 25 still applies.
Building Component Measures									
25	**No fireplace**	R	1.0	**Project does not feature fireplaces or wood burning stoves**	-	-	-	general	Reductions assume a 100% emission reduction from baseline conditions, as calculated using the methodology documented in the Staff Report for SMAQMD Rule 417, Wood Burning Appliances, Appendix D. The approach is consistent with SMAQMD rule development, based on a conversation with SMAQMD staff (Mr. Donny Homer). Calculating emission reductions in the greater Sacramento area yields 1.0 point benefit to the project, consistent with the current point value of the measure. Emission reductions are calculated as follows: Emission Reduction = (Emissions) – [(New Emissions certified stove aesthetic x fraction of adoption) + (New Emissions certified stove heat x fraction of adoption) + (New EmissionsNG aesthetic x fraction of adoption) + (New EmissionsNG heat x fraction of adoption)+ (New Emissions electric aesthetic x fraction of adoption) + (New Emissions electric heat x fraction of adoption)]

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
26	**Ozone Destruction Catalyst**	R, C, M	1.25	**Install ozone destruction catalyst on air conditioning systems**	1.25	0.054	0.0669072	general	Reductions assume over 80% of harmful, ground level ozone is converted into oxygen through application of air conditioning system technology. The proposed point value for this operational mitigation measure is 1.5, a mid-point value consistent with the rating assigned to this measure by the Feather River Air Quality Management District as a Standard Mitigation Measures for All Projects. The SMAQMD has had point values for this measure ranging from 1.25 (i.e., Land Use Mitigation Measures), to 2.5 for specific projects (i.e., Lent Ranch Marketplace, City of Elk Grove). Air conditioning systems for commercial, office and residential buildings within the project will be treated with an ozone destruction catalyst ("cap" or coating of the condenser coils) to convert ozone to oxygen as the catalyst makes contact with air moving through the air conditioner. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, specifications and any available manufacturer's documentation on the devices to be used.
27a					0.5	0.054	0.0267629	specific	Reductions are based on the credits documented in the SMAQMD Guidance for Land Use Reductions and consistent with the point rating now set at 0.5 for qualified roof products. Baseline conditions assume indirect emission reduction through more even temperature control of environmental space. Approach is enforceable and may be monitored through site review and/or consultation with lead agency that roofing materials match those described in the SMAQMD Guidance for Land Use Reductions.

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
27b	**Energy Star roof**	R,C,M	0.5-1.0	**Install Energy Star labeled roof materials**	1.0	0.054	0.0535258	specific	Additional emission reductions are available based on use of Energy Star compliant (highly reflective) and high emissivity roofing (emissivity of at least 0.9 when tested in accordance with ASTM 408) for a minimum of 75% of the roof surface. Based on the quantification methodology used by the SMAQMD Guidance for Land Use Reductions, an additional 0.5 point, for a total of 1.0 points, is available for qualified roof products that meet ATSM high emissivity requirements. Approach is enforceable and may be monitored through site review and/or consultation with lead agency that roofing materials match those described in the SMAQMD Guidance for Land Use Reductions.

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
28	**Onsite renewable energy system**	R,C,M	1.0-3.0	**Project provides onsite renewable energy system(s)**	3.0	0.054	0.1605773	general	Reductions are based on the Energy & Atmosphere credits (EA Credit 2) documented in the Leadership in Energy & Environmental Design (LEED), Green Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that at least 12.5% of the buildings total energy use (as expressed as a fraction of annual energy cost) is supplied through the use of on-site renewable energy systems. Alternatively a project may use the Department of Energy (DOE) Commercial Buildings Energy Consumption Surevy (CBECS) database to determine the estimated electricity use. Non-polluting and renewable energy potential includes solar, wind, geothermal, low-impact hydro, biomass and bio-gas strategies. When applying these strategies, projects may take advantage of net metering with the local utility. The measure is enforcable through LEED Letter certification and building design calculations demonstrating that at least 12.5% of total energy costs are supplied by the renewable energy system(s).

SMAQMD MEASURE #	*Measure Name*	*Land Use Type*	*SMAQMD Point Reductions*	*Measure Description*	*Unscaled %CO2 Emission Reduction*	*CO2 Emissions Scale Factors (SF)*	*Scaled % CO2 Emission Reduction*	*Measure Applicability (specific/ moderate/ or general basis)*	*Reduction Methodology and Source*
29	**Exceed title 24**	R,C,M	1.0	**Project Exceeds title 24 requirements by 20%**	1.0	0.054	0.0535258	specific	Reductions assume at least a 20% over Title 24 requirements, as calculated by the Sacramento Municipal Utility District (SMUD, 2006 Advantage Home Program Overview). The proposed point value for this operational mitigation measure is 1.0, consistent with the rating assigned to this measure by SMAQMD Land Use Mitigation Measures. Total compliance margin is based on energy savings relative to the total energy budget and cooling energy budget of the Title 24 Standard design home. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, specifications and any available manufacturer's documentation on the devices to be used. This measure's successful implementation may be verified by a site review following construction to confirm that the project as built contains ozone destruction catalysts as described in the Air Quality Plan.
30	**Solar orientation**	R	0.5	**Orient 75 or more percent of homes and/or buildings to face either north or south (within 30 degrees of N/S)**	0.5	0.054	0.0267629	specific	Reduction assumes that proper solar orientation can produce a total energy savings of 11% to 16.5% and reduce heating fuel consumption by up to 25% (Local Government Commission, 1998). Mitigation measure points are based on the credits documented in the SMAQMD Guidance for Land Use Reductions and consistent with the point rating now set at 0.5 for proper orientation. Reduction methodology will be based on quantification of the difference in solar radiance from development with designed orientations (75 or more percent of homes and/or buildings to face within 30 degrees either north or south) compared to evenly distributed orientations. Project compliance will be based on the percentage of orientation buildings designed with proper design features (overhangs, landscaping).

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
31	**Non-Roof Surfaces**	R,C,M	1.0	**Provide shade (within 5 years) and/or use light-colored/high-albedo materials (reflectance of at least 0.3) and/or open grid pavement for at least 30% of the site's non-roof impervious surfaces, including parking lots, walkways, plazas, etc.; OR place a minimum of 50% of parking spaces underground or covered by structured parking; OR use an open-grid pavement system (less than 50% impervious) for a minimum of 50% of the parking lot area. Unshaded parking lot areas, driveways, fire lanes, and other paved areas have a minimum albedo of .3 or greater**	1.0	0.054	0.0535258	specific	Reductions are based on the Sustainable Site credits (SS Credit 7.1) documented in the Leadership in Energy & Environmental Design (LEED), Green Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that the project provides any combination of the following strategies for 50% of the site landscape (including roads, sidewalks, courtyards nd parking lots): Shade (within 5 years of occupancy); paving materials with a solar Reflectance Index (SRI) of at least 29; open grid pavement system.
32	**Green Roof**	R,C,M	0.5	**Install a vegetated roof that covers at least 50% of roof area**	1.0	0.054	0.0535258	specific	Reductions are based on the Energy & Atmosphere credits (EA Credit 2) documented in the Leadership in Energy & Environmental Design (LEED), Green Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that a vegetated roof is installed on a least 50% of the roof area or that a combination high albedo and vegetated roof surface is installed that meets the following standard: (Area of SRI Roof/0.75)+(Area of vegetated roof/0.5) >= Total Roof Area.
TDM and Misc. measures									

SMAQMD MEASURE #	Measure Name	Land Use Type	SMAQMD Point Reductions	Measure Description	Unscaled %CO2 Emission Reduction	CO2 Emissions Scale Factors (SF)	Scaled % CO2 Emission Reduction	Measure Applicability (specific/ moderate/ or general basis)	Reduction Methodology and Source
33	**Transportation Management Association membership**	R,C,M	5	**Include permanent TMA membership and funding requirement. Funding to be provided by Community Facilities District or County Service Area or other non-revocable funding mechanism.**	6.0	0.946	5.6788455	general	TCM Encyclopedia estimates a 6-7% reduction. Urbemis specifies percent reductions based on the number of elements adopted. CCAP estimated reductions from 3% to 25% for TDMs with complementary transit and land use measures. TDMs have been shown to reduce employee vehicle trips up to 28% with the largest reductions achieved through parking pricing and transit passes. The impact depends on the travel alternatives. Sources: TCM Encyclopedia, May 11, 2006; CCAP Transportation Emission Guidebook; Nygaard, 2005' Urbemis.
34	**Electric lawnmower**	R	1	**Provide a complimentary electric lawnmower to each residential buyer**	1.0	0.054	0.0535258	specific	Reduction is based on a 0.5% reduction in total airshed VOC emissions, as attributable to the Lawn Mower Buy-Back program (Portland, Oregon, ten-year ozone maintenance plan). Mitigation measure points are based on the credits documented in the SMAQMD Guidance for Land Use Reductions and consistent with the point rating now set at 1.0 for electric lawnmowers. Approach is enforceable and may be monitored through site review and/or consultation with lead agency that roofing materials match those described in the SMAQMD Guidance for Land Use Reductions.
99	**Other**	R,C,M	TBD	**Other proposed strategies, in consultation with project lead agency and SMAQMD**	TBD	TBD	TBD	TBD	TBD

general applicability: minimal project-specific information would be required to compute a reduction

moderate applicability: some special review of project details may be required

specific applicability: would apply to fewer projects and require some detailed project-specific information

Emission Fractions were obtained from the relative proportion of the emission type to the total of area- and mobile- source emissions as contained in the 2005 Emissions Inventory for Sacramento County

Since the Emissions Inventory does not contain CO2 data, scale factors for NOx were directly applied to CO2 also. The reasoning is that since both of these pollutants are combustion byproducts, the emis

(CARB 2005)
ssion fraction by activity type would be approximately the same for both.

SMAQMD MEASURE #	*Measure Name*	*Land Use Type*	*SMAQMD Point Reductions*	*Measure Description*	*Unscaled %CO2 Emission Reduction*	*CO2 Emissions Scale Factors (SF)*	*Scaled % CO2 Emission Reduction*	*Measure Applicability (specific/ moderate/ or general basis)*	*Reduction Methodology and Source*
1	**Bike parking**	C,M	0.625	**Non-residential projects provide plentiful short-term and long-term bicycle parking facilities to meet peak season maximum demand**	0.625	0.946	0.592	general	As a rule of thumb, the Center for Clean Air Policy (CCAP) guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 1/4 of that for this measure alone. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
2	**End of trip facilities**	C,M	0.625	**Non-residential projects provide "end-of-trip" facilities including showers, lockers, and changing space**	0.625	0.946	0.592	general	The Transportation Demand Management (TDM) Encyclopedia allows a 2-5% reduction for worksite showers ad lockers. The CCAP guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 1/4 of that for this measure alone. Source: TDM Encyclopedia May 11, 2006; CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
3	**Bike parking at multi-unit residential**	R	0.625	**Long-term bicycle parking is provided at apartment complexes or condominiums without garages**	0.625	0.946	0.592	general	As a rule of thumb, the CCAP guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 25% of that for this measure alone. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

4	**Proximity to bike path/bike lanes**	R,C,M	0.625	**Entire project is located within 1/2 mile of an existing Class I or Class II bike lane and project design includes a comparable network that connects the project uses to the existing offsite facility**	0.625	0.946	0.592	general	As a rule of thumb, the CCAP guidebook attributes a 1% to 5% reduction associated with the use of bicycles, which reflects the assumption that their use is typically for shorter trips. Based on the CCAP guidebook, the TIAX report allots 2.5% reduction for all bicycle-related measures and a 1/4 of that for this measure alone. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
5	**Pedestrian network**	R,C,M	1	**The project provides a pedestrian access network that internally links all uses and connects to all existing or planned external streets and pedestrian facilities contiguous with the project site.**	1.0	0.946	0.946	general	Because this measure also eliminates physical barriers between residential and non-residential uses that impede bicycle or pedestrian circulation, this measure is similar in nature to 6. As cited in the TIAX report, the CCAP guidebook attributes a 1% reduction in VMT. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
6	**Pedestrian barriers minimized**	R,C, M	1	**Site design and building placement minimize barriers to pedestrian access and interconnectivity. Physical barriers such as walls, berms, landscaping, and slopes between residential and non-residential uses that impede bicycle or pedestrian circulation are eliminated**	1.0	0.946	0.946	general	The reduction is based on the TIAX report, which indicates a 1% reduction, and the CCAP report, which attributes a 1% to 5% reduction. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
7	**Bus shelter for existing transit service**	R,C,M	.25-1.0	**Bus or Streetcar service provides headways of one hour or less for stops within 1/4 mile; project provides safe and convenient bicycle/pedestrian access to transit stop(s) and provides essential transit stop improvements (i.e., shelters, route information, benches, and lighting).**	0.5	0.946	0.473	general	This reduction is based on the assumption that the measure applies to providing bus stop route information & benches. Emission reductions are based on conclusion obtained from the TIAX report and the CCAP guidebook. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.

8	**Bus shelter for planned transit service**	R,C,M	0.25	**Project provides transit stops with safe and convenient bicycle/pedestrian access. Project provides essential transit stop improvements (i.e., shelters, route information, benches, and lighting) in anticipation of future transit service.**	0.5	0.946	0.473	general	This reduction is based on the assumption that the measure applies to providing bus stop route information & benches. Emission reductions are based on conclusion obtained from the TIAX report and the CCAP guidebook. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by TIAX on behalf of SMAQMD.
9	**Traffic calming**	R,C,M	0.25-1.0	**Project design includes pedestrian/bicycle safety and traffic calming measures in excess of jurisdiction requirements. Roadways are designed to reduce motor vehicle speeds and encourage pedestrian and bicycle trips by featuring traffic calming features.**	see table	0.946	see table*SF	general	SMAQMD appears to have the best information available as reflected in their Guidance for Land Use Emission Reductions, which allocates reductions by the percent of intersections with traffic calming improvements as indicated in the table below. We were unable to locate more specific information. Source: Draft Update to SMAQMD Guidance for Land Use Emission Reductions.
10a	**Paid parking**	R,C,M	1.0-7.2	**Employee and/or customer paid parking system**	see table	0.946	see table*SF	general	Shoupe, 2005. Parking Cash Out. [$5/day reduces drive-alone share by 21% for commuters to downtown LA, with elasticity of -0.18 (e.g., if price increases 10%, then solo driving goes down by 1.8% more (Wilson 1991)] [Reported 1-10% reduction in trips to central city sites, and 2-4% in suburban sites (Urban Institute)].
11	**Minimum parking**	R,C,M	0.1-6.0	**Provide minimum amount of parking required. Special review of parking required.**	see formula	0.946	ee formula *S	general	Nelson/Nygaard, 2005. pg. 16. (trip reduction = ((actual parking provision - ITE parking generation rate) / ITE parking generation rate) *0.5). (Note: this formula is not verbatim from that cited in the Nelson/Nygaard document, since the formula provided did not make sense for computing trip reductions. This is what EDAW believes was meant, and this method actually works.)

12	**Parking reduction beyond code**	R,C,M	2.5	**Provide parking reduction less than code. Special review of parking required. Recommend a Shared Parking strategy.**	see formula	0.946	ee formula *S	general	Nelson/Nygaard, 2005. pg. 16. (trip reduction = ((actual parking provision - ITE parking generation rate) / ITE parking generation rate) *0.5). (Note: this formula is not verbatim from that cited in the Nelson/Nygaard document, since the formula provided did not make sense for computing trip reductions. This is what EDAW believes was meant, and this method actually works.)
13	**Pedestrian pathway through parking**	R,C,M	0.5	**Provide a parking lot design that includes clearly marked and shaded pedestrian pathways between transit facilities and building entrances**	0.5	0.946	0.473	general	The CCAP guidebook attributes between 1% and 4% reduction from all pedestrian measures. There is no specific information related to providing shaded pedestrian pathways between transit facilities and building entrances. It could be said that providing covered carpool/vanpool spaces near the entrance to the buildings has the similar goal of increasing the comfort of the user while walking to the building entrance. The TIAX report assigns a 1% reduction to the covered carpool measure. Transit usage is most affected by the headway times and the proximity to the destination. Therefore, it would seem reasonable to assume .5% Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by Tax on behalf of SMAQMD.
16	**Orientation toward existing transit, bikeway, or pedestrian corridor**	R,C,M	0.5	**Project is oriented towards existing transit, bicycle, or pedestrian corridor. Setback distance is minimized**	0.5	0.946	0.473	general	The CCAP guidebook attribute a 0.5% reduction per 1% improvement in transit frequency. Based on a case study presented in the CCAP report, a 10% increase in transit rider ship would result in a 0.5% reduction. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by Tax on behalf of SMAQMD.

21	**Affordable Housing Component**	R	0.6-4.0	**Residential development projects of 5 or more dwelling units provide a deed-restricted low-income housing component on-site (as defined in Ch 22.35 of Sacramento County Ordinance Code) [Developers who pay into In-Lieu Fee Programs are not considered eligible to receive credit for this measure]**	0.6-4.0	0.946	0.568-3.784	general	Nelson/Nygaard, 2005. pg. 15. (trip reduction = % units deed-restricted below market rate housing * 0.04).
22	**Urban mixed-use**	M	3.0-9.0	**Development of projects predominantly characterized by properties on which various uses, such as office, commercial, institutional, and residential, are combined in a single building or on a single site in an integrated development project with functional interrelationships and a coherent physical design**	3.0-9.0	0.946	2.838-8.514	general	Nelson/Nygaard, 2005. pg. 12. (trip reduction = (1-(ABS(1.5*h-e)/(1.5*h+e))-0.25)/0.25*0.03) where h = study area housing units, e = study area employment (Criteron & Fehr & Peers, 2001). Asymptote of 9% reduction, and an ideal 1.5 jobs per household.

25	**No fireplace**	R	1.0	**Project does not feature fireplaces or wood burning stoves**	-	-	-	general	Reductions assume a 100% emission reduction from baseline conditions, as calculated using the methodology documented in the Staff Report for SMAQMD Rule 417, Wood Burning Appliances, Appendix D. The approach is consistent with SMAQMD rule development, based on a conversation with SMAQMD staff (Mr. Donny Homer). Calculating emission reductions in the greater Sacramento area yields 1.0 point benefit to the project, consistent with the current point value of the measure. Emission reductions are calculated as follows: Emission Reduction = (Emissions) – [(New Emissions certified stove aesthetic x fraction of adoption) + (New Emissions certified stove heat x fraction of adoption) + (New EmissionsNG aesthetic x fraction of adoption) + (New EmissionsNG heat x fraction of adoption)+ (New Emissions electric aesthetic x fraction of adoption) + (New Emissions electric heat x fraction of adoption)]

26	**Ozone Destruction Catalyst**	R, C, M	1.25	**Install ozone destruction catalyst on air conditioning systems**	1.25	0.054	0.067	general	Reductions assume over 80% of harmful, ground level ozone is converted into oxygen through application of air conditioning system technology. The proposed point value for this operational mitigation measure is 1.5, a mid-point value consistent with the rating assigned to this measure by the Feather River Air Quality Management District as a Standard Mitigation Measures for All Projects. The SMAQMD has had point values for this measure ranging from 1.25 (i.e., Land Use Mitigation Measures), to 2.5 for specific projects (i.e., Lent Ranch Marketplace, City of Elk Grove). Air conditioning systems for commercial, office and residential buildings within the project will be treated with an ozone destruction catalyst ("cap" or coating of the condenser coils) to convert ozone to oxygen as the catalyst makes contact with air moving through the air conditioner. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, specifications and any available manufacturer's documentation on the devices to be used.

28	**Onsite renewable energy system**	R,C,M	1.0-3.0	**Project provides onsite renewable energy system(s)**	3.0	0.054	0.161	general	Reductions are based on the Energy & Atmosphere credits (EA Credit 2) documented in the Leadership in Energy & Environmental Design (LEED), Green Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that at least 12.5% of the buildings total energy use (as expressed as a fraction of annual energy cost) is supplied through the use of on-site renewable energy systems. Alternatively a project may use the Department of Energy (DOE) Commercial Buildings Energy Consumption Surevy (CBECS) database to determine the estimated electricity use. Non-polluting and renewable energy potential includes solar, wind, geothermal, low-impact hydro, biomass and bio-gas strategies. When applying these strategies, projects may take advantage of net metering with the local utility. The measure is enforcable through LEED Letter certification and building design calculations demonstrating that at least 12.5% of total energy costs are supplied by the renewable energy system(s).
33	**Transportation Management Association membership**	R,C,M	5	**Include permanent TMA membership and funding requirement. Funding to be provided by Community Facilities District or County Service Area or other non-revocable funding mechanism.**	6.0	0.946	5.679	general	TCM Encyclopedia estimates a 6-7% reduction. Urbemis specifies percent reductions based on the number of elements adopted. CCAP estimated reductions from 3% to 25% for TDMs with complementary transit and land use measures. TDMs have been shown to reduce employee vehicle trips up to 28% with the largest reductions achieved through parking pricing and transit passes. The impact depends on the travel alternatives. Sources: TCM Encyclopedia, May 11, 2006; CCAP Transportation Emission Guidebook; Nygaard, 2005' Urbemis.

14	**Off street parking**	R,C,M	0.1-1.5	**Parking facilities are not adjacent to street frontage**	0.1-1.5	0.946	0.095-1.419	moderate	No empirical support for this specific measure; however, range of values is based on other pedestrian-oriented measures. The range recognizes the dependence of this measure on other measures. To be awarded 1.0 points, development must be in an area with density, wide sidewalks, and where other uses are also hiding parking. The efficacy of this measure is reduced to 0.1 if the development does not include other pedestrian and mixed-use measures. Parking structure with ground-floor retail is awarded 0.5.
15	**Office/Mixed-use density**	C, M	0.1-1.5	**Project provides high density office or mixed-use proximate to transit**	see table	0.946	see table*SF	moderate	No empirical support for this measure, beyond that provided by SMAQMD in its draft guidance. According to Nelson/Nygaard, 2005, trip generation at the non-residential end is influenced by density to a much lesser degree, so this is fairly consistent with the transit reductions applied in measure 20.
17	**Orientation toward planned transit, bikeway, or pedestrian corridor**	C, M	0.25	**Project is oriented towards planned transit, bicycle, or pedestrian corridor. Setback distance is minimized**	0.5	0.946	0.473	moderate	The CCAP guidebook attributes a 0.5 % reduction per 1% improvement in transit frequency. Based on a case study presented in the CCAP report, a 10% increase in transit rider ship would result in a 0.5% reduction. Source: CCAP Transportation Emission Guidebook; TIAX Results of 2005 Literature Search Conducted by Tax on behalf of SMAQMD.
18	**Residential density**	R	1.0-12	**Project provides high-density residential development**	see table	0.946	see table*EF	moderate	Nelson/Nygaard, 2005. pg 11. (trip reduction = 0.6*(1-(19749*((4.814+households per residential acre)/(4.814+7.14))^-.639)/25914) (Holtzclaw et al 2002). Asymptote of 60% reduction. **Relative to a 3 du/ac development.** Note that there is no direct empirical support for the added reductions for proximity to transit; the 60% asymptote in this equation is to correct for double-counting from transit services, mix-of-uses, and bicycle and pedestrian connections (which could contribute another 40% reduction).

23	**Suburban mixed-use**	R,C,M	3	**Have at least three of the following on site and/or offsite within ¼ mile: Residential Development, Retail Development, Park, Open Space, or Office**	3.0	0.946	2.839	moderate	By definition, this type of land use implies that housing availability is greater than employment availability. On a project-by-project basis, use formula :Nelson/Nygaard, 2005. pg. 12. (trip reduction = (1-(ABS(1.5*h-e)/(1.5*h+e))-0.25)/0.25*0.03) where h = study area housing units, e = study area employment (Criteron & Fehr & Peers, 2001) to obtain higher than 3% reduction. Otherwise, assume 3% max reduction.
24	**Other mixed-use**	R, M	1	**All residential units are within ¼ mile of parks, schools or other civic uses.**	1.0	0.946	0.946	moderate	This measure has less to do with employment/housing balance. No empirical support for this measure, but logic from measures 24 and 25 still applies.
10b	**Parking cash out**	C, M	0.6-4.5	**Employer provides employees with a choice of forgoing subsidized parking for a cash payment equivalent to the cost of the parking space to the employer**	see table	0.946	see table*SF	specific	Shoupe, 2005. Parking Cash Out. [2/3 as effective as charging for parking (8 case studies - chapter 4, 13% reduction in solo driver trips, -12% VMT per employee, and -11% in vehicle trips per commuter)].
19	**Street grid**	R, C, M	1	**Multiple and direct street routing (grid style)**	1.0	0.946	0.946	specific	Reductions are based on CCAP estimates for similar measures. Source: CCAP Transportation Emission Guidebook.
20	**Neighborhood Electric Vehicle access**	R,C,M	0.5-1.5	**Make physical development consistent with requirements for neighborhood electric vehicles**	0.5-1.5	0.946	0.473-1.419	specific	No direct empirical support for this measure available. May not be relevant/applicable in the near term, until NEVs become more common/inexpensive. Current studies show that for most trips, NEVs do not replace gas-fueled vehicles as the primary vehicle. For the purposes of providing incentives for developers to promote NEV use, assume that a neighborhood with internal NEV connections only receives 0.5 points, with external connections to other surrounding uses, 1.0 point, with external connections to other NEV networks, 1.5 points.

27a	**Energy Star roof**	R,C,M	0.5-1.0	**Install Energy Star labeled roof materials**	0.5	0.054	0.027	specific	Reductions are based on the credits documented in the SMAQMD Guidance for Land Use Reductions and consistent with the point rating now set at 0.5 for qualified roof products. Baseline conditions assume indirect emission reduction through more even temperature control of environmental space. Approach is enforceable and may be monitored through site review and/or consultation with lead agency that roofing materials match those described in the SMAQMD Guidance for Land Use Reductions.
27b					1.0	0.054	0.054	specific	Additional emission reductions are available based on use of Energy Star compliant (highly reflective) and high emissivity roofing (emissivity of at least 0.9 when tested in accordance with ASTM 408) for a minimum of 75% of the roof surface. Based on the quantification methodology used by the SMAQMD Guidance for Land Use Reductions, an additional 0.5 point, for a total of 1.0 points, is available for qualified roof products that meet ATSM high emissivity requirements. Approach is enforceable and may be monitored through site review and/or consultation with lead agency that roofing materials match those described in the SMAQMD Guidance for Land Use Reductions.

29	**Exceed title 24**	R,C,M	1.0	**Project Exceeds title 24 requirements by 20%**	1.0	0.054	0.054	specific	Reductions assume at least a 20% over Title 24 requirements, as calculated by the Sacramento Municipal Utility District (SMUD, 2006 Advantage Home Program Overview). The proposed point value for this operational mitigation measure is 1.0, consistent with the rating assigned to this measure by SMAQMD Land Use Mitigation Measures. Total compliance margin is based on energy savings relative to the total energy budget and cooling energy budget of the Title 24 Standard design home. Proponent shall provide information demonstrating compliance with measure requirements including, but not limited to, specifications and any available manufacturer's documentation on the devices to be used. This measure's successful implementation may be verified by a site review following construction to confirm that the project as built contains ozone destruction catalysts as described in the Air Quality Plan.
30	**Solar orientation**	R	0.5	**Orient 75 or more percent of homes and/or buildings to face either north or south (within 30 degrees of N/S)**	0.5	0.054	0.027	specific	Reduction assumes that proper solar orientation can produce a total energy savings of 11% to 16.5% and reduce heating fuel consumption by up to 25% (Local Government Commission, 1998). Mitigation measure points are based on the credits documented in the SMAQMD Guidance for Land Use Reductions and consistent with the point rating now set at 0.5 for proper orientation. Reduction methodology will be based on quantification of the difference in solar radiance from development with designed orientations (75 or more percent of homes and/or buildings to face within 30 degrees either north or south) compared to evenly distributed orientations. Project compliance will be based on the percentage of orientation buildings designed with proper design features (overhangs, landscaping).

31	**Non-Roof Surfaces**	R,C,M	1.0	**Provide shade (within 5 years) and/or use light-colored/high-albedo materials (reflectance of at least 0.3) and/or open grid pavement for at least 30% of the site's non-roof impervious surfaces, including parking lots, walkways, plazas, etc.; OR place a minimum of 50% of parking spaces underground or covered by structured parking; OR use an open-grid pavement system (less than 50% impervious) for a minimum of 50% of the parking lot area. Unshaded parking lot areas, driveways, fire lanes, and other paved areas have a minimum albedo of .3 or greater**	1.0	0.054	0.054	specific	Reductions are based on the Sustainable Site credits (SS Credit 7.1) documented in the Leadership in Energy & Environmental Design (LEED), Green Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that the project provides any combination of the following strategies for 50% of the site landscape (including roads, sidewalks, courtyards nd parking lots): Shade (within 5 years of occupancy); paving materials with a solar Reflectance Index (SRI) of at least 29; open grid pavement system.
32	**Green Roof**	R,C,M	0.5	**Install a vegetated roof that covers at least 50% of roof area**	1.0	0.054	0.054	specific	Reductions are based on the Energy & Atmosphere credits (EA Credit 2) documented in the Leadership in Energy & Environmental Design (LEED), Green Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that a vegetated roof is installed on a least 50% of the roof area or that a combination high albedo and vegetated roof surface is installed that meets the following standard: (Area of SRI Roof/0.75)+(Area of vegetated roof/0.5) >= Total Roof Area.

34	**Electric lawnmower**	R	1	**Provide a complimentary electric lawnmower to each residential buyer**	1.0	0.054	0.054	specific	Reduction is based on a 0.5% reduction in total airshed VOC emissions, as attributable to the Lawn Mower Buy-Back program (Portland, Oregon, ten-year ozone maintenance plan). Mitigation measure points are based on the credits documented in the SMAQMD Guidance for Land Use Reductions and consistent with the point rating now set at 1.0 for electric lawnmowers. Approach is enforceable and may be monitored through site review and/or consultation with lead agency that roofing materials match those described in the SMAQMD Guidance for Land Use Reductions.
99	**Other**	R,C,M	TBD	**Other proposed strategies, in consultation with project lead agency and SMAQMD**	TBD	TBD	TBD	TBD	

general applicability: minimal project-specific information would be required to compute a reduction

moderate applicability: some special review of project details may be required

specific applicability: would apply to fewer projects and require some detailed project-specific information

Emission Fractions were obtained from the relative proportion of the emission type to the total of area- and mobile- source emissions as contained in the 2005 Emissions Inventory for Sacramento County

Since the Emissions Inventory does not contain CO_2 data, scale factors for NOx were directly applied to CO_2 also. The reasoning is that since both of these pollutants are combustion byproducts, the emis

(CARB 2005)

ssion fraction by activity type would be approximately the same for both.

HOMEWOOD MOUNTAIN RESORT

SNOWMAKING PLANNING

January 19, 2009

Table of Contents

1. Introduction

It is proposed that a vastly upgraded snowmaking system be installed at Homewood Mountain Resort in order to ensure early and late season snowpack. It is generally accepted that a ski trail requires a minimum of approximately 12" of packed snow over a fine groomed summer surface in order to provide a quality surface for skiing and snowboarding. Any less than this depth will accelerate melting of the snow pack, as well as exposure of vegetation through the snow surface which can damage the vegetation and skiers' or snowboarders' equipment. Having adequate snow depth will provide a predictable and safe sliding surface. Ideally, ski trails require in excess of four feet of snow to ensure a long lasting quality surface for a full season with typical weather conditions. This is especially important at Homewood due to its southern exposure and proximity to the lake.

A general overview of the basics of snowmaking follows. When nature does not cooperate by providing natural snow, snowmaking takes over. With a properly designed and operated snow system, the variable of having cold conditions and precipitation occur simultaneously is removed. With snowmaking, we only need cold temperature conditions to provide snow. Snowmaking requires large volumes of water, energy and temperature conditions below 28˚F.

In summary, a snowmaking machine:

a) breaks water into smaller molecules
b) cools the water
c) removes the heat of fusion
d) nucleates the water
e) provides throw to reduce grooming costs

Most requirements for snow involve very large quantities of water. For example, to cover one acre with one foot of snow requires around 200,000 gallons of water. In order to break the water droplets up into smaller particles, water pressures of at least 300 psi are advised.

A proper snowmaking plan includes providing adequate water supply and distribution, appropriate electrical supply and distribution along with the snowmaking technology to convert these resources into snow.

2. Existing System Highlights

Trails covered include:	NORTH SIDE				
	LENGTH	**WIDTH**	**PIPE**		**AREA**
Lower Rainbow/ Chute	2400ft	100ft	8”	9 Hydrants	5.5 Acres
Happy Platter	500ft	250ft	6”	3 Hydrants	2.9 Acres
Alpine Platter	500	300ft	6	5 Hydrants	3.4 Acres
Lombard Street	2700	40ft	6”	8 Hydrants	2.5
The Face	1000ft	200ft	6”	4 Hydrants	4.6
Pump House				1 Hydrants	
	SOUTH SIDE				
South Side Base Area	700ft	200ft	6”	3 Hydrants	3.2 Acres
Lower Homewood Bound	1500ft	50ft	6”	3 Hydrants	1.7 Acres

Existing snowmaking at Homewood covers 23.8 Acres
The current snowmaking at Homewood uses about 17,500,000 gallons of water per year.

The existing pumping at Homewood includes: 500gpm North Side Base Area,
500gpm Water Cooling
300gpm South Side Base Area

Existing Snowgun Summary:

3. Snowmaking Coverage Area Summary

A. Homewood Snowmaking Expansion Area Summary.

The following table represents the snowmaking expansion on the **North Side**

Trail Name	Acres	Open Depth (in)	Open Water Gallons (M)	Season Depth (ft)	Season Water Gallons (M)
Northern Return	1.7	12	0.34	4	1.36
Homeward Bound	6.9	12	1.38	4	5.5
Lombard Completion	1	12	0.20	4	0.8
Tailings	4.2	12	0.84	4	3.36
The Shaft	1.8	12	0.36	4	1.4
Pot O Gold	3.3	12	0.66	4	2.6
Rainbow Ridge	6.8	12	1.36	4	5.44
Bonanza	5.5	12	1.1	4	4.4
Miners	9	12	1.8	4	7.2
Totals	**40.2**	**12**	**8.04**	**4**	**32.06**

B. North Area Opening Snowmaking Conditions

The primary objective is to open by December 10 each year.

Based on an analysis of the weather and general experience in the Tahoe area, we can assume 150 hours at minimum 25˚F Wet Bulb between November 1 and December 25 each year in approximately 17 out of 20 years.

25˚F Wet Bulb is equivalent to 27˚F/80% RH, 26˚F/90% RH and 29˚F/60% RH.

However, colder conditions down to 15˚F can occur. Under these colder conditions, snowmaking efficiencies are greatly improved. Therefore, we suggest sizing the water capacity for 18˚F Wet Bulb. In simple terms, if the temperatures are colder, the snowmaking equipment using the same energy can convert double or triple the water volumes into snow.

So to open the proposed new snowmaking trails we need to convert 8,040,000 gallons into snow in 150 hours for average water to snow conversion rate of 900 gpm.

Plus we need to add the existing snowmaking areas @ 18.9 acres which require 3,780,000 gallons of water to cover trails 12" of snow in 150 hours for average water to snow conversion rate of 420 gpm

Total water required for 12" cover is 11,820,000 gallons

A typical snowgun converts 35 gpm at 25˚F Wet Bulb, so 38 snow guns are required to be operating.

We advise sizing the water capacity at 80 gpm/snowgun, for 18˚F x 38 snow guns which equals 3000 gpm for total future snowmaking expansion for the north side. However if Homewood would concentrate on opening trails in stages, 2000gpm on the north side would be sufficient to operate 25 machines @ 80gpm. Then open further trails in stages.

The North Side Pumping requirement is 2000gpm minimum. Total Build out 3000 gpm

The following table represents the snowmaking expansion on the **South Side**

Trail Name	Acres	Open Depth (in)	Open Water Gallons (M)	Season Depth (ft)	Season Water Gallons (M)
Mighty Mite	3	12	0.6	4	2.4
Short Cut	3.5	12	0.7	4	2.8
Mighty Fine	1.5	12	0.30	4	1.2
Martins Lane	4.6	12	0.92	4	3.6
Spill Way	1.7	12	0.34	4	1.36
Sunny Side	2.6	12	0.52	4	2.08
Prospector	1.8	12	0.36	4	1.44
El Capitan	3	12	0.60	4	2.4
Exhibition	4.5	12	0.90	4	3.6
Totals	**26.2**	**12**	**5.24**	**4**	**20.88**

D. South Area Opening Snowmaking Conditions

The primary objective is to open by December 10 each year.

So to open we need to convert 5,200,000 gallons into snow in 150 hours for average water to snow conversion rate of 600 gpm.

Plus we need to add the existing snowmaking areas @ 4.9 acres which require 980,000 gallons of water to cover trails 12" of snow in 150 hours for average water to snow conversion rate of 110gpm

Total water required for 12" cover is 6,180,000 gallons.

A typical snowgun converts 35 gpm at 25˚F Wet Bulb, so 17 snow guns are required to be operating.

We advise sizing the water capacity at 80 gpm/ snowgun for 18˚F x 17 snow guns which equals 1360 gpm. If Homewood opens these trails in stages, 1000gpm would be sufficient to operate 13 machines @ 80gpm. Then open further trails in stages.

The South Side Pumping requirement is 1000 gpm minimum. Total Buildout 1400 gpm.

4. Water Supply and Distribution

Suggested water supply pumping capacity totals follow:
North side base well 700gpm
McKinney well 1000gpm
Supply total 1700gpm
Reservoir on mountain

A. Water Supply

The Homewood snowmaking water requirements can be summarized as follows:

To open the totals are 11.82M and 5.28M gallons per side of the mountain. The snowmaking trails require around 17.1 million gallons to open.
Per season, it could be 35.46M and 15.84M per side of the mountain for a 3 to 4 foot depth
Anticipated total water usage per season would be 51.3 to 68.4 million gallons

The actual operating water consumptions would average between 1900 gpm and 3400 gpm.

The existing water supplies available for Homewood snowmaking are:

1. McKinney well – This well has been flow tested has potential for 1000 gpm

2. South Base Area - Domestic water of 300 gpm available from 6 p.m. to 6 a.m. only and the water is around 44˚F which needs a cooling tower installed to be more effective.

3. North Base Area - Domestic water of 300 gpm available from 6 p.m. to 6 a.m. Plus the existing well in the gravel parking lot which will flow up to 800gpm. At the moment this is restricted to 500gpm by the size of the pipe on the discharge side of the well pump and the tank in the pump house. A new pumphouse with another pump is suggested.

The water delivery system could also be utilized for fire protection in the forests and buildings on the mountain.

B. Pumping Alternatives

Snowmaking should have minimum 300 psi water pressures at top of system and to all snowmaking machines.

The basic methods for supplying water for snowmaking are summarized as follows:

A. 1000 gpm pumping at McKinney Well
B. 700- 1000gpm pumping from existing north base
C. 300gpm pumping from existing south side base

Total 2300gpm

Pumping Requirements as follows:

South base pump station to the top of the gondola will require (2) 300hp pumps rated at 500gpm to provide 250psi at 7300feet (top of the Gondola). Water cooling will be (2) 500gpm water cooling towers for the McKinney well water located at the south base pump house.

Top of the gondola pump station location to the top of the mountain is 600 vertical feet with friction and vertical pressure loss this comes to 700' total dynamic head. To maintain 300psi at the top of the mountain will require (1) 250HP pump in the Top of the gondola pump station.

The existing pump station at the North side base area will need to be moved to a new location. This location is still to be determined. One more 300HP pump will need to be added to this station to move 1000gpm to the top of the Gondola with sufficient pressures. There is already one existing 500gpm cooling tower so one more will need to be added to cool 1000gpm effectively.

The South side pump station will remain in the existing location, but will need to be upgraded to house more equipment. The piping and power supply mounted also need to be rerouted.

C. **Piping and Hydrant Summary**

Trail Name	Pipe				Pedestals & Hydrants
	4”	6”	8”	10”	
Northern Return	0	1800	0	0	7
Homeward Bound	0	0	0	8000	24

Mckinney well-south base pump station				2700	
Grand Totals	**3650’**	**17300’**	**4500’**	**16600’**	**127**

Piping to be buried with 4' of cover.
All trails should be final graded and excavated to final grade prior to placing piping on trails.
The existing systems would be tied into the new system.

A detailed plan for the piping and hydrants has been developed and is attached.

5. ELECTRICAL SUPPLY AND DISTRIBUTION

The snowmaking system at Homewood power requirements can be summarized as follows:

A. Estimated Loads

South base	Item	HP	Qty	Total
	Main Pumps	300	2	500
	Cooling Towers	25	2	50
	Snow guns	25	17	425
South base Total				**975 HP**
Top of gondola	Pumps	250	1	250
	Snow guns	25	28	700
Top of Gondola Total				**950 HP**
North Base	Pump	250,300	2	550
	Cooling tower	25	2	50
	Snow guns	25	28	700
North base Total				**1250 HP**
GRAND TOTAL				**3175 HP**

B. Secondary Mountain Power Distribution

The snow guns require electrical to be distributed along the trails. Next to each water hydrant will be an electrical outlet of 60 Amp capacities to plug the snowguns into. Typical circuits are 1000' to 3000' long with 5-10 pedestal outlets per circuit with 300Amp or 400Amp disconnects.

Transformers

The following are the known details and proposed upgrades of the existing electrical infrastructure, as it pertains to the chair lifts and snowmaking systems. Transformer numbers are referenced from either the transformer or SPPCO map provided by SPPCO, North Tahoe Office, dated 3-28-07. Project site map was created and provided by Snow Machines, Inc. (SMI).

Transformer #1 North Lodge snowmaking, 750kva
Existing Load; 400amp VFD, 3 fan circuits, 250 amps.
Proposed load addition; 1 fan circuit, 300 amps
Additional breaker to be used in existing switchgear.

Location; Bottom Terminal Quad chairlift
Existing transformer SPPCO # 81-3141-78789, 25kva
Ref #2 on SMI site map
Proposed upgrade; 500kva transformer
Proposed load addition; 2 fan-gun lines, 450 amps/373kva

Location; Top terminal Madden chairlift
Existing transformer SPPCO # 13333, 300kva
Ref #3 on SMI site map
Existing load; 250kva.
Proposed load addition; 4 fan-gun lines, 885amps/700 kva

Location; Bottom terminal Ellis chairlift
Existing transformer SPPCO # TS-267, 515539, 300kva
Ref #4 on SMI site map
Proposed load addition; new high speed chair lift 700 kva (motor and associated loads)
2 fan gun lines, 450kva
New load total 1150 kva

Location; Vehicle shop
Existing transformer SPPCO #?? , 750kva
Ref #5 on SMI site map
Proposed upgrade; 1000kva transformer
Proposed load addition; 7 Fan circuits, 400amps each
New 1000 amp switchgear w/breakers
New load total 1000 kva

Location; top of Quad
Existing transformer SPPCO #
Ref # 6 on SMI site map
This transformer has been upgraded to 1000 kva
Proposed are new 600amp switchgear w/breakers

Proposed transformer location “miners” ski run, no existing service
Ref #8 on SMI site map.
Proposed install; 300kva transformer

Proposed load addition; 2 fan-gun lines, 375 kva

Location; McKinney well and pump station
Existing transformer SPPCO # 80-3271, (3 pole mounted transformers, #103592, 93, 94)
Ref #9 on SMI site map
Proposed install; 1500kva transformer
Proposed load; Pump station- 5, 250 HP (1175kva) VFD and soft starters,
Misc. heaters and lights, 50kva
Need to add some space for cooling towers for well water.

A detailed plan for the secondary cabling and circuit has been developed and is attached.

6. Pumphouse Building

Consideration should be given to a larger pumphouse building to house snowguns for maintenance, hose drying and storage and for crew meetings and offices.

Once these decisions are concluded, more detailed space layouts can be developed.

7. Further Engineering

After this general concept plan is approved, more detailed engineering is required for all aspects of the project including pumping stations and buildings, water cooling towers, primary and secondary electrical supply and distribution and snow gun layouts

10. Assumptions

1. No Permits
2. No Taxes
3. No Blasting
4. No High Voltage Improvements
5. No Revegetation, Fencing, Signage or Hydrant Covers
6. No water supply improvements included

Addressing Climate Change at the Project Level
California Attorney General's Office

Under the California Environmental Quality Act (CEQA), local agencies have a very important role to play in California's fight against global warming – one of the most serious environmental effects facing the State today. Local agencies can lead by example in undertaking their own projects, insuring that sustainability is considered at the earliest stages. Moreover, they can help shape private development. Where a project as proposed will have significant global warming related effects, local agencies can require feasible changes or alternatives, and impose enforceable, verifiable, feasible mitigation to substantially lessen those effects. By the sum of their actions and decisions, local agencies will help to move the State away from "business as usual" and toward a low-carbon future.

Included in this document are various measures that may reduce the global warming related impacts at the individual project level. (For more information on actions that local governments can take at the program and general plan level, please visit the Attorney General's webpage, "CEQA, Global Warming, and General Plans" at http://ag.ca.gov/globalwarming/ceqa/generalplans.php.)

As appropriate, the measures can be included as design features of a project, required as changes to the project, or imposed as mitigation (whether undertaken directly by the project proponent or funded by mitigation fees). The measures set forth in this package are examples; the list is not intended to be exhaustive. Moreover, the measures cited may not be appropriate for every project. The decision of whether to approve a project – as proposed or with required changes or mitigation – is for the local agency, exercising its informed judgment in compliance with the law and balancing a variety of public objectives.

Mitigation Measures by Category

Energy Efficiency

Incorporate green building practices and design elements.	The California Department of Housing and Community Development's Green Building & Sustainability Resources handbook provides extensive links to green building resources. The handbook is available at http://www.hcd.ca.gov/hpd/green_build.pdf. The American Institute of Architects (AIA) has compiled fifty readily available strategies for reducing fossil fuel use in buildings by fifty percent. AIA "50 to 50" plan is presented in both guidebook and wiki format at http://wiki.aia.org/Wiki%20Pages/Home.aspx.

Meet recognized green building and energy efficiency benchmarks.	For example, an ENERGY STAR-qualified building uses less energy, is less expensive to operate, and causes fewer greenhouse gas emissions than comparable, conventional buildings. http://www.energystar.gov/index.cfm?c=business.bus_index. California has over 1600 ENERGY STAR-qualified school, commercial and industrial buildings. View U.S. EPA's list of Energy Star non-residential buildings at http://www.energystar.gov/index.cfm?fuseaction=labeled_buildings.locator. Los Angeles and San Francisco top the list of U.S. cities with the most ENERGY STAR non-residential buildings. http://www.energystar.gov/ia/business/downloads/2008_Top_25_cities_chart.pdf. Qualified ENERGY STAR homes must surpass the state's Title 24 energy efficiency building code by at least 15%. Los Angeles, Sacramento, San Diego, and San Francisco-Oakland are among the top 20 markets for ENERGY STAR homes nationwide. http://www.energystar.gov/ia/new_homes/mil_homes/top_20_markets.html. Builders of ENERGY STAR homes can be more competitive in a tight market by providing a higher quality, more desirable product. See http://www.energystar.gov/ia/partners/manuf_res/Horton.pdf. There are a variety of private and non-profit green building certification programs in use in the U.S. See U.S. EPA's Green Building / Frequently Asked Questions website, http://www.epa.gov/greenbuilding/pubs/faqs.htm. Public-Private Partnership for Advancing Housing Technology maintains a list of national and state Green Building Certification Programs for housing. See http://www.pathnet.org/sp.asp?id=20978. These include the national Leadership in Energy and Environmental Design (LEED) program, and, at the state level, Build it Green's GreenPoint Rated system and the California Green Builder program. Other organizations may provide other relevant benchmarks.
Install energy efficient lighting (e.g., light emitting diodes (LEDs)), heating and cooling systems, appliances, equipment, and control systems.	Information about ENERGY STAR-certified products in over 60 categories is available at http://www.energystar.gov/index.cfm?fuseaction=find_a_product. The California Energy Commission maintains a database of all appliances meeting either federal efficiency standards or, where there are no federal efficiency standards, California's appliance efficiency standards. See http://www.appliances.energy.ca.gov/. The Electronic Product Environmental Assessment Tool (EPEAT) ranks computer products based on a set of environmental criteria, including energy efficiency. See http://www.epeat.net/AboutEPEAT.aspx. The nonprofit American Council for an Energy Efficient Economy maintains an Online Guide to Energy Efficient Commercial Equipment, available at http://www.aceee.org/ogeece/ch1_index.htm. Utilities offer many incentives for efficient appliances, lighting, heating and cooling. To search for available residential and commercial incentives, visit Flex Your Power's website at http://www.fypower.org/.

Use passive solar design, e.g., orient buildings and incorporate landscaping to maximize passive solar heating during cool seasons, minimize solar heat gain during hot seasons, and enhance natural ventilation. Design buildings to take advantage of sunlight.	See U.S. Department of Energy, Passive Solar Design (website) http://www.energysavers.gov/your_home/designing_remodeling/index.cfm/mytopic=10250. See also California Energy Commission, Consumer Energy Center, Passive Solar Design (website) http://www.consumerenergycenter.org/home/construction/solardesign/index.html. Lawrence Berkeley National Laboratories' Building Technologies Department is working to develop innovative building construction and design techniques. Information and publications on energy efficient buildings, including lighting, windows, and daylighting strategies, are available at the Department's website at http://btech.lbl.gov.
Install light colored "cool" roofs and cool pavements.	A white or light colored roof can reduce surface temperatures by up to 100 degrees Fahrenheit, which also reduces the heat transferred into the building below. This can reduce the building's cooling costs, save energy and reduce associated greenhouse gas emissions, and extend the life of the roof. Cool roofs can also reduce the temperature of surrounding areas, which can improve local air quality. See California Energy Commission, Consumer Energy Center, Cool Roofs (webpage) at http://www.consumerenergycenter.org/coolroof/. See also Lawrence Berkeley National Laboratories, Heat Island Group (webpage) at http://eetd.lbl.gov/HeatIsland/.
Install efficient lighting, (including LEDs) for traffic, street and other outdoor lighting.	LED lighting is substantially more energy efficient than conventional lighting and can save money. See http://www.energy.ca.gov/efficiency/partnership/case_studies/TechAsstCity.pdf (noting that installing LED traffic signals saved the City of Westlake about $34,000 per year). As of 2005, only about a quarter of California's cities and counties were using 100% LEDs in traffic signals. See California Energy Commission (CEC), Light Emitting Diode Traffic Signal Survey (2005) at p. 15, available at http://www.energy.ca.gov/2005publications/CEC 400 2005 003/CEC 400 2005 003.PDF. The California Energy Commission's Energy Partnership Program can help local governments take advantage of energy saving technology, including, but not limited to, LED traffic signals. See http://www.energy.ca.gov/efficiency/partnership/.
Reduce unnecessary outdoor lighting.	See California Energy Commission, Reduction of Outdoor Lighting (webpage) at http://www.energy.ca.gov/efficiency/lighting/outdoor_reduction.html.

Use automatic covers, efficient pumps and motors, and solar heating for pools and spas.	During the summer, a traditional backyard California pool can use enough energy to power an entire home for three months. Efficiency measures can substantially reduce this waste of energy and money. See California Energy Commission, Consumer Energy Center, Pools and Spas (webpage) at http://www.consumerenergycenter.org/home/outside/pools_spas.html. See also Sacramento Municipal Utilities District, Pool and Spa Efficiency Program (webpage) at http://www.smud.org/en/residential/saving-energy/Pages/poolspa.aspx.
Provide education on energy efficiency to residents, customers and/or tenants.	Many cities and counties provide energy efficiency education. See, for example, the City of Stockton's Energy Efficiency website at http://www.stocktongov.com/energysaving/index.cfm. See also "Green County San Bernardino," http://www.greencountysb.com at pp. 4-6. Businesses and development projects may also provide education. For example, a homeowners' association (HOA) could provide information to residents on energy-efficient mortgages and energy saving measures. See The Villas of Calvera Hills, Easy Energy Saving Tips to Help Save Electricity at http://www.thevillashoa.org/green/energy/. An HOA might also consider providing energy audits to its residents on a regular basis.

Renewable Energy and Energy Storage

Meet "reach" goals for building energy efficiency and renewable energy use.	A "zero net energy" building combines building energy efficiency and renewable energy generation so that, on an annual basis, any purchases of electricity or natural gas are offset by clean, renewable energy generation, either on-site or nearby. Both the California Energy Commission (CEC) and the California Public Utilities Commission (CPUC) have stated that residential buildings should be zero net energy by 2020, and commercial buildings by 2030. See CEC, 2009 Integrated Energy Policy Report (Dec. 2009) at p. 226, available at http://www.energy.ca.gov/2009publications/CEC-100-2009-003/CEC-100-2009-003-CMF.PDF; CPUC, Long Term Energy Efficiency Strategic Plan (Sept. 2008), available at http://www.cpuc.ca.gov/PUC/energy/Energy+Efficiency/eesp/.
Install solar, wind, and geothermal power systems and solar hot water heaters.	The California Public Utilities Commission (CPUC) approved the California Solar Initiative on January 12, 2006. The initiative creates a $3.3 billion, ten-year program to install solar panels on one million roofs in the State. Visit the one-stop GoSolar website at http://www.gosolarcalifornia.org/. As mitigation, a developer could, for example, agree to participate in the New Solar Homes program. See http://www.gosolarcalifornia.org/builders/index.html. The CPUC is in the process of establishing a program to provide solar water heating incentives under the California Solar Initiative. For more information, visit the CPUC's website at http://www.cpuc.ca.gov/puc/energy/solar/swh.htm. To search for available residential and commercial renewable energy incentives, visit Flex Your Power's website at http://www.fypower.org/.

Install solar panels on unused roof and ground space and over carports and parking areas.	In 2008 Southern California Edison (SCE) launched the nation's largest installation of photovoltaic power generation modules. The utility plans to cover 65 million square feet of unused commercial rooftops with 250 megawatts of solar technology – generating enough energy to meet the needs of approximately 162,000 homes. Learn more about SCE's Solar Rooftop Program at http://www.sce.com/solarleadership/solar-rooftop-program/general-faq.htm. In 2009, Walmart announced its commitment to expand the company's solar power program in California. The company plans to add solar panels on 10 to 20 additional Walmart facilities in the near term. These new systems will be in addition to the 18 solar arrays currently installed at Walmart facilities in California. See http://walmartstores.com/FactsNews/NewsRoom/9091.aspx. Alameda County has installed two solar tracking carports, each generating 250 kilowatts. By 2005, the County had installed eight photovoltaic systems totaling over 2.3 megawatts. The County is able to meet 6 percent of its electricity needs through solar power. See http://www.acgov.org/gsa/Alameda%20County%20-%20Solar%20Case%20Study.pdf. In 2007, California State University, Fresno installed at 1.1-megawatt photovoltaic (PV)-paneled parking installation. The University expects to save more than $13 million in avoided utility costs over the project's 30-year lifespan. http://www.fresnostatenews.com/2007/11/solarwrapup2.htm.
Where solar systems cannot feasibly be incorporated into the project at the outset, build "solar ready" structures.	U.S. Department of Energy, A Homebuilder's Guide to Going Solar (brochure) (2008), available at http://www.eere.energy.gov/solar/pdfs/43076.pdf.
Incorporate wind and solar energy systems into agricultural projects where appropriate.	Wind energy can be a valuable crop for farmers and ranchers. Wind turbines can generate energy to be used on-site, reducing electricity bills, or they can yield lease revenues (as much as $4000 per turbine per year). Wind turbines generally are compatible with rural land uses, since crops can be grown and livestock can be grazed up to the base of the turbine. See National Renewable Energy Laboratory, Wind Powering America Fact Sheet Series, Wind Energy Benefits, available at http://www.nrel.gov/docs/fy05osti/37602.pdf. Solar PV is not just for urban rooftops. For example, the Scott Brothers' dairy in San Jacinto, California, has installed a 55-kilowatt solar array on its commodity barn, with plans to do more in the coming years. See http://www.dairyherd.com/directories.asp?pgID=724&ed_id=8409 (additional California examples are included in article.)

Include energy storage where appropriate to optimize renewable energy generation systems and avoid peak energy use.	See National Renewable Energy Laboratory, Energy Storage Basics (webpage) at http://www.nrel.gov/learning/eds_energy_storage.html. California Energy Storage Alliance (webpage) at http://storagealliance.org/about.html. Storage is not just for large, utility scale projects, but can be part of smaller industrial, commercial and residential projects. For example, Ice Storage Air Conditioning (ISAC) systems, designed for residential and nonresidential buildings, produce ice at night and use it during peak periods for cooling. See California Energy Commission, Staff Report, Ice Storage Air Conditioners, Compliance Options Application (May 2006), available at http://www.energy.ca.gov/2006publications/CEC-400-2006-006/CEC-400-2006-006-SF.PDF.
Use on-site generated biogas, including methane, in appropriate applications.	At the Hilarides Dairy in Lindsay, California, an anaerobic-lagoon digester processes the run-off of nearly 10,000 cows, generating 226,000 cubic feet of biogas per day and enough fuel to run two heavy duty trucks. This has reduced the dairy's diesel consumption by 650 gallons a day, saving the dairy money and improving local air quality. See http://www.arb.ca.gov/newsrel/nr021109b.htm; see also Public Interest Energy Research Program, Dairy Power Production Program, Dairy Methane Digester System, 90-Day Evaluation Report, Eden Vale Dairy (Dec. 2006) at http://www.energy.ca.gov/2006publications/CEC 500 2006 083/CEC 500 2006 083.PDF. Landfill gas is a current and potential source of substantial energy in California. See Tom Frankiewicz, Program Manager, U.S. EPA Landfill Methane Outreach Program, Landfill Gas Energy Potential in California, available at http://www.energy.ca.gov/2009_energypolicy/documents/2009-04-21_workshop/presentations/05-SCS_Engineers_Presentation.pdf. There are many current and emerging technologies for converting landfill methane that would otherwise be released as a greenhouse gas into clean energy. See California Integrated Waste Management Board, Emerging Technologies, Landfill Gas-to-Energy (webpage) at http://www.ciwmb.ca.gov/LEACentral/TechServices/EmergingTech/default.htm.

Use combined heat and power (CHP) in appropriate applications.	Many commercial, industrial, and campus-type facilities (such as hospitals, universities and prisons) use fuel to produce steam and heat for their own operations and processes. Unless captured, much of this heat is wasted. CHP captures waste heat and re-uses it, e.g., for residential or commercial space heating or to generate electricity. See U.S. EPA, Catalog of CHP Technologies at http://www.epa.gov/chp/documents/catalog_of_%20chp_tech_entire.pdf and California Energy Commission, Distributed Energy Resource Guide, Combined Heat and Power (webpage) at http://www.energy.ca.gov/distgen/equipment/chp/chp.html. The average efficiency of fossil-fueled power plants in the United States is 33 percent. By using waste heat recovery technology, CHP systems typically achieve total system efficiencies of 60 to 80 percent. CHP can also substantially reduce emissions of carbon dioxide. http://www.epa.gov/chp/basic/efficiency.html. Currently, CHP in California has a capacity of over 9 million kilowatts. See list of California CHP facilities at http://www.eea-inc.com/chpdata/States/CA.html. The Waste Heat and Carbon Emissions Reduction Act (Assembly Bill 1613 (2007), amended by Assembly Bill 2791 (2008)) is designed to encourage the development of new CHP systems in California with a generating capacity of not more than 20 megawatts. Among other things, the Act requires the California Public Utilities Commission to establish (1) a standard tariff allowing CHP generators to sell electricity for delivery to the grid and (2) a "pay as you save" pilot program requiring electricity corporations to finance the installation of qualifying CHP systems by nonprofit and government entities. For more information, see http://www.energy.ca.gov/wasteheat/.

Water Conservation and Efficiency

Incorporate water-reducing features into building and landscape design.	According to the California Energy Commission, water-related energy use – which includes conveyance, storage, treatment, distribution, wastewater collection, treatment, and discharge – consumes about 19 percent of the State's electricity, 30 percent of its natural gas, and 88 billion gallons of diesel fuel every year. See http://www.energy.ca.gov/2007publications/CEC 999 2007 008/CEC 999 2007 008.PDF. Reducing water use and improving water efficiency can help reduce energy use and greenhouse gas emissions.
Create water-efficient landscapes.	The California Department of Water Resources' updated Model Water Efficient Landscape Ordinance (Sept. 2009) is available at http://www.water.ca.gov/wateruseefficiency/landscapeordinance/technical.cfm. A landscape can be designed from the beginning to use little or no water, and to generate little or no waste. See California Integrated Waste Management Board, Xeriscaping (webpage) at http://www.ciwmb.ca.gov/organics/Xeriscaping/.

Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and use water-efficient irrigation methods.	U.S. Department of Energy, Best Management Practice: Water-Efficient Irrigation (webpage) at http://www1.eere.energy.gov/femp/program/waterefficiency_bmp5.html. California Department of Water Resources, Landscape Water Use Efficiency (webpage) at http://www.water.ca.gov/wateruseefficiency/landscape/. Pacific Institute, More with Less: Agricultural Water Conservation and Efficiency in California (2008), available at http://www.pacinst.org/reports/more_with_less_delta/index.htm.
Make effective use of graywater. (Graywater is untreated household waste water from bathtubs, showers, bathroom wash basins, and water from clothes washing machines. Graywater to be used for landscape irrigation.)	California Building Standards Commission, 2008 California Green Building Standards Code, Section 604, pp. 31-32, available at http://www.documents.dgs.ca.gov/bsc/2009/part11_2008_calgreen_code.pdf. California Department of Water Resources, Dual Plumbing Code (webpage) at http://www.water.ca.gov/recycling/DualPlumbingCode/. See also Ahwahnee Water Principles, Principle 6, at http://www.lgc.org/ahwahnee/h2o_principles.html. The Ahwahnee Water Principles have been adopted by City of Willits, Town of Windsor, Menlo Park, Morgan Hill, Palo Alto, Petaluma, Port Hueneme, Richmond, Rohnert Park, Rolling Hills Estates, San Luis Obispo, Santa Paula, Santa Rosa, City of Sunnyvale, City of Ukiah, Ventura, Marin County, Marin Municipal Water District, and Ventura County.
Implement low-impact development practices that maintain the existing hydrology of the site to manage storm water and protect the environment.	Retaining storm water runoff on-site can drastically reduce the need for energy-intensive imported water at the site. See U.S. EPA, Low Impact Development (webpage) at http://www.epa.gov/nps/lid/. Office of Environmental Health Hazard Assessment and the California Water and Land Use Partnership, Low Impact Development at http://www.coastal.ca.gov/nps/lid-factsheet.pdf.
Devise a comprehensive water conservation strategy appropriate for the project and location.	The strategy may include many of the specific items listed above, plus other innovative measures that are appropriate to the specific project.
Design buildings to be water-efficient. Install water-efficient fixtures and appliances.	Department of General Services, Best Practices Manual, Water-Efficient Fixtures and Appliances (website) at http://www.green.ca.gov/EPP/building/SaveH2O.htm. Many ENERGY STAR products have achieved their certification because of water efficiency. See California Energy Commission's database, available at http://www.appliances.energy.ca.gov/.

Offset water demand from new projects so that there is no net increase in water use.	For example, the City of Lompoc has a policy requiring new development to offset new water demand with savings from existing water users. See http://www.cityoflompoc.com/utilities/pdf/2005_uwmp_final.pdf at p. 29.
Provide education about water conservation and available programs and incentives.	See, for example, the City of Santa Cruz, Water Conservation Office at http://www.ci.santa-cruz.ca.us/index.aspx?page=395; Santa Clara Valley Water District, Water Conservation at http://www.valleywater.org/conservation/index.shtm; and Metropolitan Water District and the Family of Southern California Water Agencies, Be Water Wise at http://www.bewaterwise.com. Private projects may provide or fund similar education.

Solid Waste Measures

Reuse and recycle construction and demolition waste (including, but not limited to, soil, vegetation, concrete, lumber, metal, and cardboard).	Construction and demolition materials account for almost 22 percent of the waste stream in California. Reusing and recycling these materials not only conserves natural resources and energy, but can also save money. For a list of best practices and other resources, see California Integrated Waste Management Board, Construction and Demolition Debris Recycling (webpage) at http://www.ciwmb.ca.gov/condemo/.
Integrate reuse and recycling into residential industrial, institutional and commercial projects.	Tips on developing a successful recycling program, and opportunities for cost-effective recycling, are available on the California Integrated Waste Management Board's Zero Waste California website. See http://zerowaste.ca.gov/. The Institute for Local Government's Waste Reduction & Recycling webpage contains examples of "best practices" for reducing greenhouse gas emissions, organized around waste reduction and recycling goals and additional examples and resources. See http://www.ca-ilg.org/wastereduction.
Provide easy and convenient recycling opportunities for residents, the public, and tenant businesses.	Tips on developing a successful recycling program, and opportunities for cost effective recycling, are available on the California Integrated Waste Management Board's Zero Waste California website. See http://zerowaste.ca.gov/.
Provide education and publicity about reducing waste and available recycling services.	Many cities and counties provide information on waste reduction and recycling. See, for example, the Butte County Guide to Recycling at http://www.recyclebutte.net. The California Integrated Waste Management Board's website contains numerous publications on recycling and waste reduction that may be helpful in devising an education project. See http://www.ciwmb.ca.gov/Publications/default.asp?cat=13. Private projects may also provide waste and recycling education directly, or fund education.

Land Use Measures

Ensure consistency with "smart growth" principles – mixed-use, infill, and higher density projects that provide alternatives to individual vehicle travel and promote the efficient delivery of services and goods.	U.S. EPA maintains an extensive Smart Growth webpage with links to examples, literature and technical assistance, and financial resources. See http://www.epa.gov/smartgrowth/index.htm. The National Oceanic and Atmospheric Administration's webpage provides smart growth recommendations for communities located near water. See Coastal & Waterfront Smart Growth (webpage) at http://coastalsmartgrowth.noaa.gov/. The webpage includes case studies from California. The California Energy Commission has recognized the important role that land use can play in meeting our greenhouse gas and energy efficiency goals. The agency's website, Smart Growth & Land Use Planning, contains useful information and links to relevant studies, reports, and other resources. See http://www.energy.ca.gov/landuse/. The Metropolitan Transportation Commission's webpage, Smart Growth / Transportation for Livable Communities, includes resources that may be useful to communities in the San Francisco Bay Area and beyond. See http://www.mtc.ca.gov/planning/smart_growth/. The Sacramento Area Council of Governments (SACOG) has published examples of smart growth in action in its region. See Examples from the Sacramento Region of the Seven Principles of Smart Growth / Better Ways to Grow, available at http://www.sacog.org/regionalfunding/betterways.pdf.
Meet recognized "smart growth" benchmarks.	For example, the LEED for Neighborhood Development (LEED-ND) rating system integrates the principles of smart growth, urbanism and green building into the first national system for neighborhood design. LEED-ND is a collaboration among the U.S. Green Building Council, Congress for the New Urbanism, and the Natural Resources Defense Council. For more information, see http://www.usgbc.org/DisplayPage.aspx?CMSPageID=148.
Educate the public about the many benefits of well-designed, higher density development.	See, for example, U.S. EPA, Growing Smarter, Living Healthier: A Guide to Smart Growth and Active Aging (webpage), discussing how compact, walkable communities can provide benefits to seniors. See http://www.epa.gov/aging/bhc/guide/index.html. U.S. EPA, Environmental Benefits of Smart Growth (webpage) at http://www.epa.gov/dced/topics/eb.htm (noting local air and water quality improvements). Centers for Disease Control and Prevention (CDC), Designing and Building Healthy Places (webpage), at http://www.cdc.gov/healthyplaces/. The CDC's website discusses the links between walkable communities and public health and includes numerous links to educational materials. California Department of Housing and Community Development, Myths and Facts About Affordable and High Density Housing (2002), available at http://www.hcd.ca.gov/hpd/mythsnfacts.pdf.

Incorporate public transit into the project's design.	Federal Transit Administration, Transit-Oriented Development (TOD) (webpage) at http://www.fta.dot.gov/planning/planning_environment_6932.html (describing the benefits of TOD as "social, environmental, and fiscal.") California Department of Transportation (Caltrans), Statewide Transit-Oriented Development Study: Factors for Success in California (2002), available at http://transitorienteddevelopment.dot.ca.gov/miscellaneous/StatewideTOD.htm Caltrans, California Transit-Oriented Development Searchable Database (includes detailed information on numerous TODs), available at http://transitorienteddevelopment.dot.ca.gov/miscellaneous/NewHome.jsp. California Department of Housing and Community Development, Transit Oriented Development (TOD) Resources (Aug. 2009), available at http://www.hcd.ca.gov/hpd/tod.pdf.
Preserve and create open space and parks. Preserve existing trees, and plant replacement trees at a set ratio.	U.S. EPA, Smart Growth and Open Space Conservation (webpage) at http://www.epa.gov/dced/openspace.htm.
Develop "brownfields" and other underused or defunct properties near existing public transportation and jobs.	U.S. EPA, Smart Growth and Brownfields (webpage) at http://www.epa.gov/dced/brownfields.htm. For example, as set forth in the Local Government Commission's case study, the Town of Hercules, California reclaimed a 426-acre brownfield site, transforming it into a transit-friendly, walkable neighborhood. See http://www.lgc.org/freepub/docs/community_design/fact_sheets/er_case_studies.pdf. For financial resources that can assist in brownfield development, see Center for Creative Land Recycling, Financial Resources for California Brownfields (July 2008), available at http://www.cclr.org/media/publications/8-Financial_Resources_2008.pdf.
Include pedestrian and bicycle facilities within projects and ensure that existing non-motorized routes are maintained and enhanced.	See U.S. Department of Transportation, Federal Highway Administration, Bicycle and Pedestrian Program (webpage) at http://www.fhwa.dot.gov/environment/bikeped/. Caltrans, Pedestrian and Bicycle Facilities in California / A Technical Reference and Technology Transfer Synthesis for Caltrans Planners and Engineers (July 2005), available at http://www.dot.ca.gov/hq/traffops/survey/pedestrian/TR_MAY0405.pdf. This reference includes standard and innovative practices for pedestrian facilities and traffic calming.

Transportation and Motor Vehicles

Meet an identified transportation-related benchmark.	A logical benchmark might be related to vehicles miles traveled (VMT), e.g., average VMT per capita, per household, or per employee. As the California Energy Commission has noted, VMT by California residents increased "a rate of more than 3 percent a year between 1975 and 2004, markedly faster than the population growth rate over the same period, which was less than 2 percent. This increase in VMT correlates to an increase in petroleum use and GHG production and has led to the transportation sector being responsible for 41 percent of the state's GHG emissions in 2004." CEC, The Role of Land Use in Meeting California's Energy and Climate Change Goals (Aug. 2007) at p. 9, available at http://www.energy.ca.gov/2007publications/CEC-600-2007-008/CEC-600-2007-008-SF.PDF. Even with regulations designed to increase vehicle efficiency and lower the carbon content of fuel, "reduced VMT growth will be required to meet GHG reductions goals." *Id.* at p. 18.
Adopt a comprehensive parking policy that discourages private vehicle use and encourages the use of alternative transportation.	For example, reduce parking for private vehicles while increasing options for alternative transportation; eliminate minimum parking requirements for new buildings; "unbundle" parking (require that parking is paid for separately and is not included in rent for residential or commercial space); and set appropriate pricing for parking. See U.S. EPA, Parking Spaces / Community Places, Finding the Balance Through Smart Growth Solutions (Jan. 2006), available at http://www.epa.gov/dced/pdf/EPAParkingSpaces06.pdf. Reforming Parking Policies to Support Smart Growth, Metropolitan Transportation Commission (June 2007) at http://www.mtc.ca.gov/planning/smart_growth/parking_seminar/Toolbox Handbook.pdf. See also the City of Ventura's Downtown Parking and Mobility Plan, available at http://www.cityofventura.net/community_development/resources/mobility_parking_plan.pdf, and Ventura's Downtown Parking Management Program, available at http://www.ci.ventura.ca.us/depts/comm_dev/downtownplan/chapters.asp.
Build or fund a major transit stop within or near the development.	"'Major transit stop' means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods." (Pub. Res. Code, § 21064.3.) Transit Oriented Development (TOD) is a moderate to higher density development located within an easy walk of a major transit stop. http://transitorienteddevelopment.dot.ca.gov/miscellaneous/NewWhatisTOD.htm. By building or funding a major transit stop, an otherwise ordinary development can become a TOD.

Provide public transit incentives such as free or low-cost monthly transit passes to employees, or free ride areas to residents and customers.	See U.S. Department of Transportation and U.S. EPA, Commuter Choice Primer / An Employer's Guide to Implementing Effective Commuter Choice Programs, available at http://www.its.dot.gov/JPODOCS/REPTS_PR/13669.html. The Emery Go Round shuttle is a private transportation service funded by commercial property owners in the citywide transportation business improvement district. The shuttle links a local shopping district to a Bay Area Rapid Transit stop. See http://www.emerygoround.com/. Seattle, Washington maintains a public transportation "ride free" zone in its downtown from 6:00 a.m. to 7:00 p.m. daily. See http://transit.metrokc.gov/tops/accessible/paccessible_map.html#fare.
Promote "least polluting" ways to connect people and goods to their destinations.	Promoting "least polluting" methods of moving people and goods is part of a larger, integrated "sustainable streets" strategy now being explored at U.C. Davis's Sustainable Transportation Center. Resources and links are available at the Center's website, http://stc.ucdavis.edu/outreach/ssp.php.
Incorporate bicycle lanes, routes and facilities into street systems, new subdivisions, and large developments.	Bicycling can have a profound impact on transportation choices and air pollution reduction. The City of Davis has the highest rate of bicycling in the nation. Among its 64,000 residents, 17 percent travel to work by bicycle and 41 percent consider the bicycle their primary mode of transportation. See Air Resources Board, Bicycle Awareness Program, Bicycle Fact Sheet, available at http://www.arb.ca.gov/planning/tsaq/bicycle/factsht.htm. For recommendations on best practices, see the many resources listed at the U.S. Department of Transportation, Federal Highway Administration's Bicycle and Pedestrian website at http://www.fhwa.dot.gov/environment/bikeped/publications.htm. See also Caltrans Division of Research and Innovation, Designing Highway Facilities To Encourage Walking, Biking and Transit (Preliminary Investigation) (March 2009), available at http://www.dot.ca.gov/research/researchreports/preliminary_investigations/docs/pi-design_for_walking_%20biking_and_transit%20final.pdf.
Require amenities for non-motorized transportation, such as secure and convenient bicycle parking.	According to local and national surveys of potential bicycle commuters, secure bicycle parking and workplace changing facilities are important complements to safe and convenient routes of travel. See Air Resources Board, Bicycle Awareness Program, Bicycle Fact Sheet, available at http://www.arb.ca.gov/planning/tsaq/bicycle/factsht.htm.

Ensure that the project enhances, and does not disrupt or create barriers to, non-motorized transportation.	See, e.g., U.S. EPA's list of transit-related "smart growth" publications at http://www.epa.gov/dced/publications.htm#air, including Pedestrian and Transit-Friendly Design: A Primer for Smart Growth (1999), available at www.epa.gov/dced/pdf/ptfd_primer.pdf. See also Toolkit for Improving Walkability in Alameda County, available at http://www.acta2002.com/ped toolkit/ped_toolkit_print.pdf. Pursuant to the California Complete Streets Act of 2008 (AB 1358, Gov. Code, §§ 65040.2 and 65302), commencing January 1, 2011, upon any substantive revision of the circulation element of the general plan, a city or county will be required to modify the circulation element to plan for a balanced, multimodal transportation network that meets the needs of all users.
Connect parks and open space through shared pedestrian/bike paths and trails to encourage walking and bicycling. Create bicycle lanes and walking paths directed to the location of schools, parks and other destination points.	Walk Score ranks the "walkability" of neighborhoods in the largest 40 U.S. cities, including seven California cities. Scores are based on the distance to nearby amenities. Explore Walk Score at http://www.walkscore.com/. In many markets, homes in walkable neighborhoods are worth more than similar properties where walking is more difficult. See Hoak, *Walk appeal / Homes in walkable neighborhoods sell for more: study*, Wall Street Journal (Aug. 18, 2009), available at http://www.marketwatch.com/story/homes-in-walkable-neighborhoods-sell-for-more-2009-08-18. By creating walkable neighborhoods with more transportation choices, Californians could save $31 million and cut greenhouse gas emissions by 34 percent, according to a study released by Transform, a coalition of unions and nonprofits. See Windfall for All / How Connected, Convenient Neighborhoods Can Protect Our Climate and Safeguard California's Economy (Nov. 2009), available at http://transformca.org/windfall-for-all#download-report.
Work with the school districts to improve pedestrian and bike access to schools and to restore or expand school bus service using lower-emitting vehicles.	In some communities, twenty to twenty-five percent of morning traffic is due to parents driving their children to school. Increased traffic congestion around schools in turn prompts even more parents to drive their children to school. Programs to create safe routes to schools can break this harmful cycle. See California Department of Public Health, Safe Routes to School (webpage) and associated links at http://www.cdph.ca.gov/HealthInfo/injviosaf/Pages/SafeRoutestoSchool.aspx. See also U.S. EPA, Smart Growth and Schools (webpage), available at http://www.epa.gov/dced/schools.htm. California Center for Physical Activity, California Walk to School (website) at http://www.cawalktoschool.com Regular school bus service (using lower-emitting buses) for children who cannot bike or walk to school could substantially reduce private vehicle congestion and air pollution around schools. See Air Resources Board, Lower Emissions School Bus Program (webpage) at http://www.arb.ca.gov/msprog/schoolbus/schoolbus.htm.

Institute teleconferencing, telecommute and/or flexible work hour programs to reduce unnecessary employee transportation.	There are numerous sites on the web with resources for employers seeking to establish telework or flexible work programs. These include U.S. EPA's Mobility Management Strategies: Commuter Programs website at http://www.epa.gov/otaq/stateresources/rellinks/mms_commprograms.htm; and Telework, the federal government's telework website, at http://www.telework.gov/. Through a continuing FlexWork Implementation Program, the Traffic Solutions division of the Santa Barbara County Association of Governments sponsors flexwork consulting, training and implementation services to a limited number of Santa Barbara County organizations that want to create or expand flexwork programs for the benefit of their organizations, employees and the community. See http://www.flexworksb.com/read_more_about_the_fSBp.html. Other local government entities provide similar services.
Provide information on alternative transportation options for consumers, residents, tenants and employees to reduce transportation-related emissions.	Many types of projects may provide opportunities for delivering more tailored transportation information. For example, a homeowner's association could provide information on its website, or an employer might create a Transportation Coordinator position as part of a larger Employee Commute Reduction Program. See, e.g., South Coast Air Quality Management District, Transportation Coordinator training, at http://www.aqmd.gov/trans/traing.html.
Educate consumers, residents, tenants and the public about options for reducing motor vehicle-related greenhouse gas emissions. Include information on trip reduction; trip linking; vehicle performance and efficiency (e.g., keeping tires inflated); and low or zero-emission vehicles.	See, for example U.S. EPA, SmartWay Transport Partnership: Innovative Carrier Strategies (webpage) at http://www.epa.gov/smartway/transport/what-smartway/carrier-strategies.htm. This webpage includes recommendations for actions that truck and rail fleets can take to make ground freight more efficient and cleaner. The Air Resources Board's Drive Clean website is a resource for car buyers to find clean and efficient vehicles. The web site is designed to educate Californians that pollution levels range greatly between vehicles. See http://www.driveclean.ca.gov/. The Oregon Department of Transportation and other public and private partners launched the Drive Less/Save More campaign. The comprehensive website contains fact sheets and educational materials to help people drive more efficiently. See http://www.drivelesssavemore.com/.
Purchase, or create incentives for purchasing, low or zero-emission vehicles.	See Air Resources Board, Low-Emission Vehicle Program (webpage) at http://www.arb.ca.gov/msprog/levprog/levprog.htm. Air Resource Board, Zero Emission Vehicle Program (webpage) at http://www.arb.ca.gov/msprog/zevprog/zevprog.htm. All new cars sold in California are now required to display an Environmental Performance (EP) Label, which scores a vehicle's global warming and smog emissions from 1 (dirtiest) to 10 (cleanest). To search and compare vehicle EP Labels, visit www.DriveClean.ca.gov.

Create a ride sharing program. Promote existing ride sharing programs e.g., by designating a certain percentage of parking spaces for ride sharing vehicles, designating adequate passenger loading and unloading for ride sharing vehicles, and providing a web site or message board for coordinating rides.	For example, the 511 Regional Rideshare Program is operated by the Metropolitan Transportation Commission (MTC) and is funded by grants from the Federal Highway Administration, U.S. Department of Transportation, the Metropolitan Transportation Commission, the Bay Area Air Quality Management District and county congestion management agencies. For more information, see http://rideshare.511.org/. As another example, San Bernardino Associated Governments works directly with large and small employers, as well as providing support to commuters who wish to share rides or use alternative forms of transportation. See http://www.sanbag.ca.gov/commuter/rideshare.html. Valleyrides.com is a ridesharing resource available to anyone commuting to and from Fresno and Tulare Counties and surrounding communities. See http://www.valleyrides.com/. There are many other similar websites throughout the state.
Create or accommodate car sharing programs, e.g., provide parking spaces for car share vehicles at convenient locations accessible by public transportation.	There are many existing car sharing companies in California. These include City CarShare (San Francisco Bay Area), see http://www.citycarshare.org/; and Zipcar, see http://www.zipcar.com/. Car sharing programs are being successfully used on many California campuses.
Provide a vanpool for employees.	Many local Transportation Management Agencies can assist in forming vanpools. See, for example, Sacramento Transportation Management Association, Check out Vanpooling (webpage) at http://www.sacramento-tma.org/vanpool.html.
Create local "light vehicle" networks, such as neighborhood electric vehicle systems.	See California Energy Commission, Consumer Energy Center, Urban Options - Neighborhood Electric Vehicles (NEVs) (webpage) at http://www.consumerenergycenter.org/transportation/urban_options/nev.html. The City of Lincoln has an innovative NEV program. See http://www.lincolnev.com/index.html.
Enforce and follow limits idling time for commercial vehicles, including delivery and construction vehicles.	Under existing law, diesel-fueled motor vehicles with a gross vehicle weight rating greater than 10,000 pounds are prohibited from idling for more than 5 minutes at any location. The minimum penalty for an idling violation is now $300 per violation. See http://www.arb.ca.gov/enf/complaints/idling_cv.htm.
Provide the necessary facilities and infrastructure to encourage the use of low or zero-emission vehicles.	For a list of existing alternative fuel stations in California, visit http://www.cleancarmaps.com/. See, e.g., Baker, *Charging-station network built along 101*, S.F. Chron. (9/23/09), available at http://articles.sfgate.com/2009-09-23/news/17207424_1_recharging-solar-array-tesla-motors.

Agriculture and Forestry (additional strategies noted above)

Require best management practices in agriculture and animal operations to reduce emissions, conserve energy and water, and utilize alternative energy sources, including biogas, wind and solar.	Air Resources Board (ARB), Economic Sectors Portal, Agriculture (webpage) at http://www.arb.ca.gov/cc/ghgsectors/ghgsectors.htm. ARB's webpage includes information on emissions from manure management, nitrogen fertilizer, agricultural offroad equipment, and agricultural engines. "A full 90% of an agricultural business' electricity bill is likely associated with water use. In addition, the 8 million acres in California devoted to crops consume 80% of the total water pumped in the state." See Flex Your Power, Agricultural Sector (webpage) at http://www.fypower.org/agri/. Flex Your Power, Best Practice Guide / Food and Beverage Growers and Processors, available at http://www.fypower.org/bpg/index.html?b=food_and_bev. Antle et al., Pew Center on Global Climate Change, Agriculture's Role in Greenhouse Gas Mitigation (2006), available at http://www.pewclimate.org/docUploads/Agriculture's%20Role%20in%20GHG%20Mitigation.pdf.
Preserve forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, groundwater recharge areas and other open space that provide carbon sequestration benefits.	"There are three general means by which agricultural and forestry practices can reduce greenhouse gases: (1) avoiding emissions by maintaining existing carbon storage in trees and soils; (2) increasing carbon storage by, e.g., tree planting, conversion from conventional to conservation tillage practices on agricultural lands; (3) substituting bio-based fuels and products for fossil fuels, such as coal and oil, and energy-intensive products that generate greater quantities of CO_2 when used." U.S. EPA, Carbon Sequestration in Agriculture and Forestry, Frequently Asked Questions (webpage) at http://www.epa.gov/sequestration/faq.html. Air Resources Board, Economic Sectors Portal, Forestry (webpage) at http://www.arb.ca.gov/cc/ghgsectors/ghgsectors.htm.
Protect existing trees and encourage the planting of new trees. Adopt a tree protection and replacement ordinance.	Tree preservation and planting is not just for rural areas of the state; suburban and urban forests can also serve as carbon sinks. See Cal Fire, Urban and Community Forestry (webpage) at http://www.fire.ca.gov/resource_mgt/resource_mgt_urbanforestry.php.

Off-Site Mitigation

If, after analyzing and requiring all reasonable and feasible on-site mitigation measures for avoiding or reducing greenhouse gas-related impacts, the lead agency determines that additional mitigation is required, the agency may consider additional off-site mitigation. The project proponent could, for example, fund off-site mitigation projects that will reduce carbon emissions, conduct an audit of its other existing operations and agree to retrofit, or purchase verifiable carbon "credits" from another entity that will undertake mitigation.

The topic of off-site mitigation can be complicated. A full discussion is outside the scope of this summary document. Issues that the lead agency should consider include:

- The location of the off-site mitigation. (If the off-site mitigation is far from the project, any additional, non-climate related co-benefits of the mitigation may be lost to the local community.)

- Whether the emissions reductions from off-site mitigation can be quantified and verified. (The California Registry has developed a number of protocols for calculating, reporting and verifying greenhouse gas emissions. Currently, industry-specific protocols are available for the cement sector, power/utility sector, forest sector and local government operations. For more information, visit the California Registry's website at http://www.climateregistry.org/.)

- Whether the mitigation ratio should be greater than 1:1 to reflect any uncertainty about the effectiveness of the off-site mitigation.

Offsite mitigation measures that could be funded through mitigation fees include, but are not limited to, the following:

- Energy efficiency audits of existing buildings.

- Energy efficiency upgrades to existing buildings not otherwise required by law, including heating, ventilation, air conditioning, lighting, water heating equipment, insulation and weatherization (perhaps targeted to specific communities, such as low-income or senior residents).

- Programs to encourage the purchase and use of energy efficient vehicles, appliances, equipment and lighting.

- Programs that create incentives to replace or retire polluting vehicles and engines.

- Programs to expand the use of renewable energy and energy storage.

- Preservation and/or enhancement of existing natural areas (e.g., forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, and groundwater recharge areas) that provide carbon sequestration benefits.

- Improvement and expansion of public transit and low- and zero-carbon transportation alternatives.

EDMUND G. BROWN JR.

VIA E-MAIL & U.S. MAIL

Dave Warner
Director of Permit Services
San Joaquin Valley Air Pollution Control District
1990 East Gettysburg Ave.
Fresno, CA 93726-0244

RE: Final Draft Staff Report on Greenhouse Gas Emissions Under CEQA

Dear Mr. Warner:

We have reviewed the San Joaquin Valley Air Pollution Control District's September 17, 2009, Final Draft Staff Report on "Addressing Greenhouse Gas Emissions Under the California Environmental Quality Act."[1] We appreciate the Air District's extensive efforts and leadership in this area.[2] We are concerned, however, that the approaches suggested in the Staff Report will not withstand legal scrutiny and may result in significant lost opportunities for the Air District and local governments to require mitigation of greenhouse gas (GHG) emissions.

The Staff Report sets out a proposed threshold of significance for GHG emissions for stationary source projects under the Air District's permitting authority. A threshold of significance is, in effect, a working definition of significance to be applied on a project-by-project basis that can help a lead agency determine which projects normally will be determined to be less than significant, and which normally will be determined to be significant.[3] In the context of GHG emissions, the relevant question is whether the project's emissions, when considered in conjunction with the emissions of past, current, and probable future projects, are

[1] The Attorney General submits these comments pursuant to his independent power and duty to protect the natural resources of the State. (See Cal. Const., art. V., § 13; Cal. Gov. Code, §§ 12511, 12600-12612; *D'Amico v. Board of Medical Examiners* (1974) 11 Cal.3d 1, 14-15.)
[2] The Staff Report states that "[n]o state agency has provided substantial and helpful guidance on how to adequately address GHG emissions under CEQA, nor has there been guidance on how to determine if such impacts are significant." (Report at p. 2.) In fact, there are numerous sources of guidance, including information on the Attorney General's website (http://ag.ca.gov/globalwarming/ceqa.php), a Technical Advisory issued by the Governor's Office of Planning and Research (http://opr.ca.gov/ceqa/pdfs/june08-ceqa.pdf); and the Resources Agency's proposed CEQA Guidelines amendments (http://ceres.ca.gov/ceqa/guidelines/), which is accompanied by a detailed, 78-page Initial Statement of Reasons (http://ceres.ca.gov/ceqa/docs/Initial_Statement_of_Reasons.pdf).
[3] Cal. Code Regs., tit. 14, § 15064.7, subd. (a).

cumulatively considerable.[4] Thresholds can be a useful interim tool until cities and counties have in place programmatic approaches, e.g., Climate Action Plans, which allow local government to consider a wide variety of mitigation opportunities and can substantially streamline the CEQA process for individual projects.[5] Staff's proposed stationary source GHG threshold relies on implementation of GHG emission control technologies. Under this proposal, projects that implement currently unspecified GHG Best Performance Standards ("BPS") would be deemed to not have significant impacts, regardless of the total amount of GHGs emitted.

The Staff Report also recommends a threshold of significance for cities and counties to use in determining whether a development or transportation project's GHG emissions are significant under CEQA. Like the stationary source threshold, this threshold would also rely on performance measures that are not currently identified. BPS for these projects would be any combination of identified GHG reduction measures that reduce project-specific GHG emission by at least 29 percent as compared to "business as usual," as calculated based on a point system to be developed in the future by the Air District.

The Staff Report contains a useful analysis of possible GHG mitigation measures for a variety of stationary sources and for development and transportation projects. This discussion will certainly assist lead agencies and project proponents in considering what mitigation measures currently are available and should be considered. It is not clear to us, however, how much additional analysis the Air District plans to do to support the proposed CEQA thresholds of significance recommended in the Staff Report. A public agency proposing to adopt a CEQA threshold of significance should be able to answer at least the following questions about its proposed approach:

What defined, relevant environmental objective is the threshold designed to meet, and what evidence supports selection of that objective?

The Staff Report does not discuss a particular environmental objective that would be achieved by implementing the proposed thresholds, such as meeting a GHG emissions reduction trajectory consistent with that set forth in AB 32 and Executive Order S-03-05 within the Air District's jurisdiction.[6] It appears that the Air District has not yet determined what amount of

---

[4] Cal. Code Regs., tit. 14, § 15064, subd. (h)(1); see also Initial Statement of Reasons at p. 17 ("Due to the global nature of GHG emissions and their potential effects, GHG emissions will typically be addressed in a cumulative impacts analysis.")

[5] See Proposed Cal. Code Regs., tit. 14, § 15183.5, subd. (b) (describing tiering and streamlining available under "Plans for the Reduction of Greenhouse Gas Emissions"), available at http://ceres.ca.gov/ceqa/docs/FINAL_Text_of_Proposed_Amendemts.pdf; Draft Initial Statement of Reasons (discussing proposed § 15183.5) , available at http://ceres.ca.gov/ceqa/docs/Initial_Statement_of_Reasons.pdf#page=56; see also See Attorney General's General Plan/CEQA Frequently Asked Questions, available at http://ag.ca.gov/globalwarming/pdf/CEQA_GP_FAQs.pdf.

[6] Pursuant to these mandates, California is committed to reducing GHG emissions to 1990 levels by 2020, and to 80 percent below 1990 levels by 2050. These objectives are consistent with the underlying environmental objective of stabilizing atmospheric concentrations of greenhouse gases at a level that will substantially reduce the risk of dangerous climate change. (See AB 32 Scoping Plan at p. 4 ["The 2020 goal was established to be an aggressive,

GHG reduction it is aiming to achieve. Setting a relevant environmental objective is an essential step in establishing any legally defensible threshold of significance; without it, there is nothing against which to gauge the success of the threshold in operation.

What is the evidence that adopting the threshold will meet this objective?

Because the BPS discussed in the Staff Report are described as "illustrative" only, it is not possible at this time to determine whether the BPS ultimately adopted will reduce GHG emissions in the San Joaquin Valley and, if so, by how much. There is no stated commitment to tie BPS proposed in the future to regional GHG reduction objectives.

How does the threshold take into account the presumptive need for new development to be more GHG-efficient than existing development?

The Staff Report seems to assume that if new development projects reduce emissions by 29 percent compared to "business as usual," the 2020 statewide target of 29 percent below "business as usual" will also be achieved, but it does not supply evidence of this. Indeed, it seems that new development must be more GHG-efficient than this average, given that past and current sources of emissions, which are substantially less efficient than this average, will continue to exist and emit.[7]

Will the threshold routinely require new projects to consider mitigation beyond what is already required by law?

Because "business as usual" for a development project is defined by the Staff Report as what was typically done in similar projects in the 2002-2004 timeframe, and requirements affecting GHG emissions have advanced substantially since that date, it appears that the Air District's proposal would award emission reduction "points" for undertaking mitigation measures that are already required by local or state law.[8]

Similarly, we are concerned that project proponents could "game" the system. Under the current proposal, each project will be considered against a hypothetical project that could have been built on the site in the 2002-2004 time period. It is not clear why the project should be compared against a hypothetical project if that hypothetical project could not legally be built

---

but achievable, mid-term target, and the 2050 greenhouse gas emissions reduction goal represents the level scientists believe is necessary to reach levels that will stabilize climate."])

[7] We note that CAPCOA expressly found that an approach that would rely on 28 to 33 percent reductions from BAU would have a "low" GHG emissions reduction effectiveness. CAPCOA, CEQA and Climate Change (Jan. 2008) at p. 56, available at http://www.capcoa.org/CEQA/CAPCOA%20White%20Paper.pdf.

[8] To take one important example, Title 24 has undergone two updates since 2002-2004 – in 2005 and 2008. The 2008 Title 24 standards are approximately 15 percent more stringent that the 2005 version. In addition, a significant number of local governments have adopted green building ordinances that go beyond Title 24 in just the past few years, and many more are considering adopting such ordinances as part of their Climate Action Plans. See http://ag.ca.gov/globalwarming/pdf/green_building.pdf.

today,[9] and the approach would appear to offer an incentive to project proponents to artificially inflate the hypothetical project to show that the proposed project is, by comparison, GHG-efficient.[10]

Will operation of the threshold allow projects with large total GHG emissions to avoid environmental review? What evidence supports such a result?

It appears that any project employing certain, as of yet unidentified, mitigation measures would be considered to not be significant, regardless of the project's total GHG emissions, which could be very large. For instance, under the Air District's proposal, it would appear that even a new development on the scale of a small city would be considered to not have a significant GHG impact and would not have to undertake further mitigation, provided it employs the specified energy efficiency and transportation measures. This would be true even if the new development emitted hundreds of thousands of tons of GHG each year, and even though other feasible measures might exist to reduce those impacts.[11] The Staff Report has not supplied scientific or quantitative support for the conclusion that such a large-emitting project, even if it earned 29 "points," would not have a significant effect on the environment.

Will the threshold benefit lead agencies in their determinations of significance?

For the reasons set forth above, we fear that the recommended approach in its current form may unnecessarily subject lead agencies that follow them to CEQA litigation. This would be detrimental not only to the lead agencies, but to the many project proponents who may face unnecessary delay and legal uncertainty.[12]

---

[9] The appropriate baseline under CEQA is not a hypothetical future project, but rather existing physical conditions. (Cal. Code Regs., tit. 14, § 15126.2, subd. (a).)

[10] A detailed analysis of the proposed amendments to Rule 2301 (emissions reduction credit banking) is beyond the scope of this letter. It is important, however, that any such plan comply with CEQA's requirements for additionality. As the most recent draft of the proposed CEQA Guidelines notes, only "[r]eductions in emissions that are not otherwise required may constitute mitigation pursuant to this subdivision." Proposed Cal. Code Regs., tit. 14, § 15126.4, subd. (c), available at http://ceres.ca.gov/ceqa/docs/Text_of_Proposed_Changes.pdf.

[11] In the advance of a programmatic approach to addressing GHG emissions, lead agencies must examine even GHG-efficient projects with some scrutiny where total emissions are large. Once a programmatic approach is in place, the lead agency will be able to determine whether even a larger-emitting project is, or is not, consistent with the lead agency's overall strategy for reducing GHG emissions. If it is, the lead agency may be able to determine that its incremental contribution to climate change is not cumulatively considerable.

[12] The Staff Report states that "[l]ocal land-use agencies are facing increasing difficulties in addressing GHG emissions in their efforts to comply with CEQA." (Report at p. 2.) We strongly believe that this experience is not universal. In fact, many cities and counties are actively taking up their role as "essential partners" in addressing climate change (see AB 32 Scoping Plan at p. 26) by making commitments to develop local Climate Action Plans.

We support staff's continued work in this area. However, before formally endorsing or adopting any particular threshold, we recommend that the Air District consider the issues that we have raised in this letter; if warranted, evaluate the approaches currently under consideration by other districts; and, if possible, work with those districts to devise approaches that are complementary and serve CEQA's objectives.

Sincerely,

/ s /

TIMOTHY E. SULLIVAN
Deputy Attorney General

For EDMUND G. BROWN JR.
Attorney General

MOBILITY 2030 for the next generation

LAKE TAHOE REGIONAL TRANSPORTATION PLAN

FINAL

August 27, 2008

Reducing Greenhouse Gas Emissions at Lake Tahoe

The Lake Tahoe Region is particularly vulnerable to the impacts of global climate change, just as it is to other environmental impacts. The region's economy is highly dependent on the health of its environmental assets, including its substantial snowpack, a clear lake, and healthy forests, all of which will be negatively affected by warming temperatures.

Emissions from motor vehicles, including cars, buses and boats, are a leading source of greenhouse gas emissions in the Basin. Motor vehicle use has been identified as a major contributor to the loss of clarity of Lake Tahoe, contributing to runoff from roadways and the emission of nitrogen oxides and particulate matter, causing algae growth in the Lake. Since 1982, the TRPA has strived to meet two air quality threshold indicators: Vehicle Miles Traveled (VMT) and traffic counts. Both of these criteria should be reduced to 1981 levels. These threshold indicators are consistent with the goals of California's Global Warming Solutions Act (AB32) of 2006, which specifies that the state must reduce greenhouse gas emissions to 1990 levels by 2020. Vehicle Miles Traveled have been decreasing in the Lake Tahoe Region over the last five years, and traffic counts, which, for the purposes of the threshold indicator, are measured at a location in South Lake Tahoe, are also trending downward.

Because of the air quality thresholds and the intense focus on environmental health in the Lake Tahoe Region, the goals and policies of past regional plans and regional transportation plans have focused on reducing emissions from motor vehicles, and on shifting people out of their cars and into other, lower impact modes such as transit, bicycling, and walking. This Regional Transportation Plan continues this trend, with the majority of policies and projects encouraging transit and pedestrian-oriented development, constructing pedestrian and bicycling facilities, and strengthening the transit system. Those projects that are related to roadway improvements are limited to minor changes such as adding left-hand turn lanes or improving traffic signalization to provide for a more efficient use of the current roadway network. These projects relieve congestion without widening roadways or adding major capacity for motor vehicles.

Concurrent with the development of this regional transportation plan is a comprehensive revision and update to the regional plan for the Lake Tahoe Region. The regional plan outlines goals and policies for many resource areas in addition to transportation, and will examine land-use and building strategies that can reduce greenhouse gas emissions. The regional plan will include a region-wide analysis that looks at all aspects of the plan with respect to climate change, including transportation.

Projects that affect greenhouse gas emissions

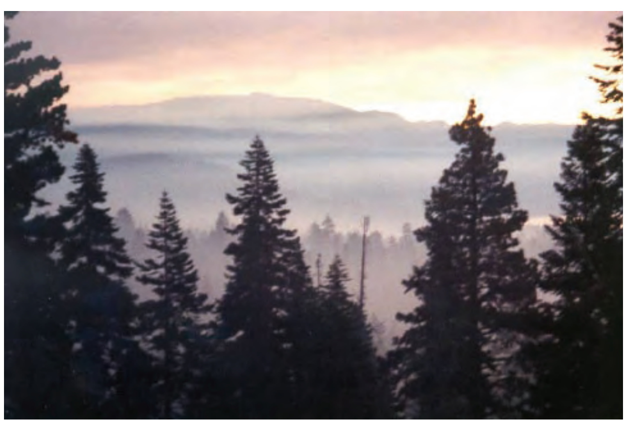
In the area of transportation, most greenhouse gas emissions are associated with motor vehicle use. Therefore, projects that shift people out of cars and into other, lower-emission alternatives will reduce greenhouse gas emissions. The projects proposed as part of Mobility 2030, the Lake Tahoe Regional Transportation Plan, are grouped below into three categories: projects that will likely reduce greenhouse gas emissions, projects that will likely increase greenhouse gas emissions, and those where the effect on emissions is unclear or may be neutral.

Projects that were placed in the "reduce" category are those that aim to reduce vehicle use or vehicle emissions as a primary goal. For instance, all bicycle trails and pedestrian improvements are considered to reduce emissions, since the primary goals of these projects getting drivers to walk or bicycle for trips they otherwise would have made by motor vehicle, thus reducing air quality emissions. Likewise, capital improvements in bus fleets were considered to reduce greenhouse gas emissions, since one of the main purposes of replacing buses is introducing newer, cleaner technologies to the fleets.

Projects included in the "increase" greenhouse gas emissions category are those that create capacity increases for motor vehicles. These capacity increases are still quite small, compared to those planned in larger, urban areas, but they create additional lane capacity for several thousand feet of roadway in order to alleviate reoccurring congestion at key points. Aviation service enhancements are also considered to increase greenhouse gas emissions as air travel is one of the most energy-intensive forms of travel.

Projects that are in the “unclear” column include certain transit and roadway improvement projects. These projects may reduce greenhouse gas emissions in some ways, but could increase them in others. New transit services get people out of their cars, but if older buses with out-of-date emissions technology are used to provide that transit service, then ridership must be high enough to outweigh the impacts of the additional bus emissions. As capital improvements are made to bus fleets, however, emissions will be reduced. Likewise, roadway improvements can decrease greenhouse gas emissions by reducing idling times, but at the same time they can increase the capacity of a roadway, allowing and encouraging more vehicles to use the roadway system. The roadway capacity increases in the 2008 RTP are intended to encourage greater flexibility to implement alternative mode options.

As a percentage of total project cost, projects that will likely reduce greenhouse gas emissions are estimated at approximately 57% of expenditures; those that will likely increase greenhouse gas emissions are approximately 1% of expenditures; and those whose effect is unclear make up 42% of expenditures. See Figure 6.6.



Policies that affect greenhouse gas emissions

Most of the goals and policies in the Regional Transportation Plan focus on reducing environmental impacts of motor vehicles, including emissions of greenhouse gasses.

GOAL #1 Pedestrian Transit Oriented Development (PTOD) Plan for and promote land use changes and development patterns consistent with the Regional Plan that encourage the development of walkable, mixed-use centers that support transportation enhancements and environmental improvements while improving the viability of transit systems.

GOAL #2 Pedestrian/Bicycle Friendly Communities Design an atmosphere elevating bicycle and pedestrian usage to the primary modes of transportation at Lake Tahoe.

GOAL #3 Utilization of Intelligent Transportation Systems (ITS). Technology shall be considered, implemented and used to increase usage of alternative modes.

GOAL #4 Actively pursue programs that promote the use and expansion of mass transit.

GOAL #5 Participate in state and local transportation planning efforts to ensure coordination and consistency in the transportation system, and to strengthen inter and intra-regional transportation.

GOAL #7 Develop parking management strategies for the Tahoe Region.

GOAL #8 Manage and respond to transportation demand through traffic management plans.

GOAL #10 Improve the mobility of the elderly, handicapped and other transit-dependent groups.

GOAL #12 Develop an on-going source of regional revenue to fund alternative transportation operations and maintenance.

For the full text of goals and associated policies, please refer to Chapter 2.

Percentage of Total Cost	57%	15%	28%	

Figure 6.6 cont.

Conclusion

The main focus of the regional transportation plan is to implement projects that reduce dependency on the private automobile and ultimately reduce environmental and climate impacts. There is, however, a group of projects in the plan for which the environmental impact is as yet unclear. The impact of these individual projects on greenhouse gas emissions will be fully analyzed by project level environmental documentation during project development. Many of these projects provide mobility and social services that are vital to Lake Tahoe communities, such as frequent transit service in low-income neighborhoods. These systems provide the infrastructure necessary to shift people out of private vehicles, and as transit technology improves, will no doubt provide a reduction in greenhouse gases. Overall, the regional transportation plan directs over $200 million to projects that will reduce greenhouse gas emissions in the Basin from transportation-related sources over the next 20 years. The plan's strategies and overall policy direction set the stage for a strong focus on reducing greenhouse gas emissions in the Basin.

CONFERENCE OF THE PARTIES
Eighth session
New Delhi, 23 October – 1 November 2002
Agenda item 4 (b) (ii)

REVIEW OF THE IMPLEMENTATION OF COMMITMENTS AND OF OTHER PROVISIONS OF THE CONVENTION

NATIONAL COMMUNICATIONS: GREENHOUSE GAS INVENTORIES FROM PARTIES INCLUDED IN ANNEX I TO THE CONVENTION

UNFCCC guidelines on reporting and review

CONTENTS

Introduction

This document contains two sets of revised guidelines pertaining to greenhouse gas (GHG) inventories of Parties included in Annex I to the Convention (Annex I Parties), adopted by the Conference of the Parties at its eighth session as annexes to decisions 18/CP.8 and 19/CP.8 (FCCC/CP/2002/7/Add.2).

The first, "Guidelines for the preparation of national communications by Parties included in Annex I to the Convention, Part I: UNFCCC Reporting guidelines on annual inventories", was adopted with decision 18/CP.8. This decision requires Annex I Parties to begin using these guidelines for reporting the annual inventories due in the year 2004. For inventory submissions due in 2003, the decision states that Annex I Parties should continue to use the original inventory reporting guidelines adopted with decision 3/C.P.5. Annual inventories of Annex I Parties are due by 15 April each year.

The second, "Guidelines for the technical review of greenhouse gas inventories from Parties included in Annex I to the Convention", was adopted with decision 19/CP. 8. This decision requires that these guidelines be used for the reviews of GHG inventories beginning in the year 2003.

These guidelines have been compiled in a single document to facilitate ease of use by Annex I Parties.

GUIDELINES FOR THE PREPARATION OF NATIONAL COMMUNICATIONS BY PARTIES INCLUDED IN ANNEX I TO THE CONVENTION, PART I: UNFCCC REPORTING GUIDELINES ON ANNUAL INVENTORIES

A. Objectives

1. The objectives of the UNFCCC reporting guidelines on annual inventories are:

(a) To assist Parties included in Annex I to the Convention (Annex I Parties) in meeting their commitments under Articles 4 and 12 of the Convention and to assist Annex I Parties to the Kyoto Protocol in preparing to meet commitments under Articles 3, 5 and 7 of the Kyoto Protocol;

(b) To facilitate the process of considering annual national inventories, including the preparation of technical analysis and synthesis documentation;

(c) To facilitate the process of verification, technical assessment and expert review of the inventory information.

B. Principles and definitions

2. National greenhouse gas inventories, referred to below only as inventories, should be transparent, consistent, comparable, complete and accurate.

3. Inventories should be prepared using comparable methodologies agreed upon by the Conference of the Parties (COP), as indicated in paragraph 9 below.

4. In the context of these UNFCCC reporting guidelines on annual inventories:

Transparency means that the assumptions and methodologies used for an inventory should be clearly explained to facilitate replication and assessment of the inventory by users of the reported information. The transparency of inventories is fundamental to the success of the process for the communication and consideration of information;

Consistency means that an inventory should be internally consistent in all its elements with inventories of other years. An inventory is consistent if the same methodologies are used for the base and all subsequent years and if consistent data sets are used to estimate emissions or removals from sources or sinks. Under certain circumstances referred to in paragraphs 15 and 16, an inventory using different methodologies for different years can be considered to be consistent if it has been recalculated in a transparent manner, in accordance with the Intergovernmental Panel on Climate Change (IPCC) *Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories*;[1]

Comparability means that estimates of emissions and removals reported by Annex I Parties in inventories should be comparable among Annex I Parties. For this purpose, Annex I Parties should use the methodologies and formats agreed by the COP for estimating and reporting inventories. The allocation of different source/sink categories should follow the split of the *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories*,[2] at the level of its summary and sectoral tables;

---

[1] Referred to in this document as the IPCC good practice guidance. The IPCC is currently developing *Good Practice Guidance for Land Use, Land-Use Change and Forestry*.

[2] Referred to in this document as the IPCC Guidelines.

Completeness means that an inventory covers all sources and sinks, as well as all gases, included in the IPCC Guidelines as well as other existing relevant source/sink categories which are specific to individual Annex I Parties and, therefore, may not be included in the IPCC Guidelines. Completeness also means full geographic coverage of sources and sinks of an Annex I Party;[3]

Accuracy is a relative measure of the exactness of an emission or removal estimate. Estimates should be accurate in the sense that they are systematically neither over nor under true emissions or removals, as far as can be judged, and that uncertainties are reduced as far as practicable. Appropriate methodologies should be used, in accordance with the IPCC good practice guidance, to promote *accuracy* in inventories.

5. In the context of these guidelines, definitions of common terms used in greenhouse gas inventory preparation are those provided in the IPCC good practice guidance.

C. Context

6. These UNFCCC reporting guidelines on annual inventories cover the estimation and reporting of greenhouse gas emissions and removals in both annual inventories and inventories included in national communications, as specified by decision 11/CP.4 and other relevant decisions of the COP.

7. An annual inventory submission shall consist of a national inventory report (NIR) and the common report format (CRF) tables, as described in paragraphs 38 through 43 and 44 through 50, respectively.

D. Base year

8. The year 1990 should be the base year for the estimation and reporting of inventories. According to the provisions of Article 4.6 of the Convention and decisions 9/CP.2 and 11/CP.4, the following Annex I Parties that are undergoing the process of transition to a market economy are allowed to use a base year or a period of years other than 1990, as follows:

Bulgaria:	1988
Hungary:	the average of the years 1985 to 1987
Poland:	1988
Romania:	1989
Slovenia:	1986

E. Methods

Methodology

9. Annex I Parties shall use the IPCC Guidelines to estimate and report on anthropogenic emissions by sources and removals by sinks of greenhouse gases not controlled by the Montreal Protocol. In preparing national inventories of these gases, Annex I Parties shall also use the IPCC good practice guidance in order to improve transparency, consistency, comparability, completeness and accuracy.

10. In accordance with the IPCC Guidelines, Annex I Parties may use different methods (tiers) included in those guidelines, giving priority to those methods which, according to the decision trees in the IPCC good practice guidance, produce more accurate estimates. In accordance with the IPCC Guidelines, Annex I Parties may also use national methodologies which they consider better able to

---

3 According to the instrument of ratification, acceptance, approval or accession to the Convention of each Annex I Party.

reflect their national situation, provided that these methodologies are compatible with the IPCC Guidelines and IPCC good practice guidance and are well documented and scientifically based.

11. For source categories that are determined to be key source categories, in accordance with IPCC good practice guidance, and estimated in accordance with the provisions in paragraph 13 below, Annex I Parties should make every effort to use a recommended method, in accordance with the corresponding decision trees of the IPCC good practice guidance. Annex I Parties should also make every effort to develop and/or select emission factors, and collect and select activity data, in accordance with the IPCC good practice guidance.

12. For most source categories, the IPCC Guidelines provide a default methodology which includes default emission factors and in some cases default activity data references. Furthermore, the IPCC good practice guidance provides updated default emission factors and default activity data for some sources and gases. As the assumptions implicit in these default data, factors and methods may not be appropriate for specific national contexts, it is preferable for Annex I Parties to use their own national emission factors and activity data, where available, provided that they are developed in a manner consistent with the IPCC good practice guidance, are considered to be more accurate, and reported transparently. The updated default activity data or emission factors provided in the IPCC good practice guidance should be used, where available, if Annex I Parties choose to use default factors or data due to lack of country-specific information.

Key source category determination

13. Annex I Parties shall identify their national key source categories for the base year and the latest reported inventory year, as described in the IPCC good practice guidance, using the tier 1 or tier 2 level and trend assessment.

Uncertainties

14. Annex I Parties shall quantitatively estimate the uncertainties in the data used for all source and sink categories using at least the tier 1 method, as provided in the IPCC good practice guidance. Alternatively, Annex I Parties may use the tier 2 method in the IPCC good practice guidance to address technical limitations in the tier 1 method. Uncertainty in the data used for all source and sink categories should also be qualitatively discussed in a transparent manner in the NIR, in particular for those sources that were identified as key sources.

Recalculations

15. The inventories of an entire time series, including the base year and all subsequent years for which inventories have been reported, should be estimated using the same methodologies, and the underlying activity data and emission factors should be obtained and used in a consistent manner. Recalculations should ensure consistency of the time series and shall be carried out only to improve accuracy and/or completeness. Where the methodology or manner in which underlying activity data and emission factors are gathered has changed, Annex I Parties should recalculate inventories for the base and subsequent years. Annex I Parties should evaluate the need for recalculations relative to the reasons provided by the IPCC good practice guidance, in particular for key sources. Recalculations should be performed in accordance with IPCC good practice guidance and the general principles set down in these UNFCCC guidelines.

16. In some cases it may not be possible to use the same methods and consistent data sets for all years due to a possible lack of activity data, emission factors or other parameters directly used in the calculation of emission estimates for some historical years, including the base year. In such cases, emissions or removals may need to be recalculated using alternative methods not generally covered by

paragraphs 9 through 12. In these instances, Annex I Parties should use one of the techniques provided by the IPCC good practice guidance (e.g., overlap, surrogate, interpolation, and extrapolation) to determine the missing values. Annex I Parties should document and demonstrate in the NIR that the time series is consistent, wherever such techniques are used.

Quality assurance/quality control (QA/QC)

17. Each Annex I Party shall elaborate an inventory QA/QC plan and implement general inventory QC procedures (tier 1)[4] in accordance with its QA/QC plan following the IPCC good practice guidance. In addition, Annex I Parties should apply source category specific QC procedures (tier 2) for key source categories and for those individual source categories in which significant methodological changes and/or data revisions have occurred, in accordance with IPCC good practice guidance. The implementation of tier 2 QC may be more efficiently implemented in conjunction with the evaluation of uncertainties in data sources. In addition, Annex I Parties should implement QA procedures by conducting a basic expert peer review (tier 1 QA) of their inventories in accordance with IPCC good practice guidance.

F. Reporting

1. General guidance

Estimates of emissions and removals

18. Article 12.1(a) of the Convention requires that each Party shall communicate to the COP, through the secretariat, inter alia, a national inventory of anthropogenic emissions by sources and removals by sinks of all greenhouse gases not controlled by the Montreal Protocol. As a minimum requirement, inventories shall contain information on the following greenhouse gases: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), perfluorocarbons (PFCs), hydrofluorocarbons (HFCs) and sulphur hexafluoride (SF_6). Annex I Parties should report anthropogenic emissions and removals of any other greenhouse gases whose 100-year global warming potential (GWP) values have been identified by the IPCC and adopted by the COP. Annex I Parties should also provide information on the following indirect greenhouse gases: carbon monoxide (CO), nitrogen oxides (NO_x) and non-methane volatile organic compounds (NMVOCs), as well as sulphur oxides (SO_x).

19. Greenhouse gas emissions and removals should be presented on a gas-by-gas basis in units of mass with emissions by sources listed separately from removals by sinks, except in cases where it may be technically impossible to separate information on sources and sinks in the areas of land use, land-use change and forestry. For HFCs and PFCs, emissions should be reported for each relevant chemical in the category on a disaggregated basis, except in cases where paragraph 27 below applies.

20. In addition, consistent with decision 2/CP.3, Annex I Parties should report aggregate emissions and removals of greenhouse gases, expressed in CO_2 equivalent terms at summary inventory level,[5] using GWP values provided by the IPCC in its Second Assessment Report, referred to below as 1995 IPCC GWP values, based on the effects of greenhouse gases over a 100-year time horizon. A list of these values is given in table 1 at the end of these guidelines. Table 1 will be amended to include any additional greenhouse gases and their 100-year GWP values, once the GWP values have been adopted by the COP.

---

[4] As outlined in table 8.1 of the IPCC good practice guidance.

[5] CO_2 equivalent emissions should be provided at a level of category disaggregation similar to that specified in table Summary 1.A of the common reporting format.

21. Consistent with decision 2/CP.3, Annex I Parties should report actual emissions of HFCs, PFCs and SF_6, where data are available, providing disaggregated data by chemical (for example, HFC-134a) and source category in units of mass and in CO_2 equivalents. Annex I Parties should make every effort to develop the necessary sources of data for reporting actual emissions. For the source categories where the concept of potential emissions applies, and Annex I Parties do not yet have the necessary data to calculate actual emissions, Annex I Parties should report disaggregated potential emissions. Annex I Parties reporting actual emissions should also report potential emissions for the sources where the concept of potential emissions applies, for reasons of transparency and comparability.

22. Any Annex I Party that is a Party to the Kyoto Protocol and that in accordance with Article 3, paragraph 8 of the Kyoto Protocol chooses to use 1995 as its base year for HFCs, PFCs and SF_6 for the purposes of calculating assigned amounts pursuant to Article 3, paragraphs 7 and 8 of the Kyoto Protocol, should indicate this in its NIR and in the documentation boxes of the relevant tables of the CRF. Irrespective of the base year chosen for these gases for the purpose of the Kyoto Protocol, such Annex I Parties should report, to the extent that data are available, emission estimates and trends for these gases from 1990 onward, in accordance with the provisions of these guidelines.

23. Annex I Parties are strongly encouraged to also report emissions and removals of additional greenhouse gases for which 100-year GWP values are available, but not yet adopted by the COP. These emissions and removals should be reported separately from national totals. The GWP value and reference should be indicated.

24. In accordance with the IPCC Guidelines, international aviation and marine bunker fuel emissions should not be included in national totals but should be reported separately. Annex I Parties should make every effort to both apply and report according to the IPCC good practice guidance method for separation between domestic and international emissions. Annex I Parties should also report emissions from international aviation and marine bunker fuels as two separate entries in their inventories.

25. Annex I Parties should clearly indicate how feedstocks and non-energy use of fuels have been accounted for in the inventory, in the energy or industrial processes sector, in accordance with the IPCC good practice guidance.

26. If Annex I Parties account for effects of CO_2 capture from flue gases and subsequent CO_2 storage in their inventory, they should indicate in which source categories such effects are included, and provide transparent documentation of the methodologies used and the resulting effects.

27. Emissions and removals should be reported at the most disaggregated level of each source/sink category, taking into account that a minimum level of aggregation may be required to protect confidential business and military information.

Completeness

28. Where methodological or data gaps in inventories exist, information on these gaps should be presented in a transparent manner. Annex I Parties should clearly indicate the sources and sinks not considered in their inventories but which are included in the IPCC Guidelines, and explain the reasons for such exclusion. Similarly, Annex I Parties should indicate the parts of their geographical area, if any, not covered by their inventory and explain the reasons for their exclusion. In addition, Annex I Parties should use the notation keys presented below to fill in the blanks in all the tables in the CRF.[6]
This approach facilitates assessment of the completeness of an inventory.

---

6 If notation keys are used in the NIR they should be consistent with those reported in the CRF.

The notation keys are as follows:

(a) "NO" (not occurring) for activities or processes in a particular source or sink category that do not occur within a country;

(b) "NE" (not estimated) for existing emissions by sources and removals by sinks of greenhouse gases which have not been estimated. Where "NE" is used in an inventory for emissions or removals of CO_2, N_2O, CH_4, HFCs, PFCs or SF_6, the Annex I Party should indicate in both the NIR and the CRF completeness table why emissions or removals have not been estimated; [7]

(c) "NA" (not applicable) for activities in a given source/sink category that do not result in emissions or removals of a specific gas. If categories in the CRF for which "NA" is applicable are shaded, they do not need to be filled in;

(d) "IE" (included elsewhere) for emissions by sources and removals by sinks of greenhouse gases estimated but included elsewhere in the inventory instead of the expected source/sink category. Where "IE" is used in an inventory, the Annex I Party should indicate, using the CRF completeness table, where in the inventory the emissions or removals from the displaced source/sink category have been included and the Annex I Party should explain such a deviation from the expected category;

(e) "C" (confidential) for emissions by sources and removals by sinks of greenhouse gases which could lead to the disclosure of confidential information, given the provisions of paragraph 27 above.

29. If Annex I Parties estimate and report emissions and removals from country-specific sources or sinks or of gases which are not part of the IPCC Guidelines, they should explicitly describe what source/sink categories or gases these are, as well as what methodologies, emission factors and activity data have been used for their estimation and provide the references for these data.

Key sources

30. Annex I Parties shall estimate and report the individual and cumulative percentage contributions of emissions from key source categories to their national total, with respect to both emission level and emission trend. The emissions should be expressed in terms of CO_2 equivalents using the methods provided in the IPCC good practice guidance. As indicated in paragraphs 41 and 47 below, this information should be included in table 7 of the CRF as well as the NIR using tables 7.A1 – 7.A3 of the IPCC good practice guidance adapted to the level of category disaggregation that the Annex I Party used for determining its key sources.

Verification

31. In accordance with the IPCC Guidelines, as well as for verification purposes, Annex I Parties should compare their national estimates of carbon dioxide emissions from fuel combustion with those estimates obtained using the IPCC reference approach, and report the results of this comparison in the CRF and NIR. Annex I Parties are also encouraged to report on any peer review of their inventory conducted nationally.

Uncertainties

32. Annex I Parties shall report, in the NIR, uncertainties estimated as indicated in paragraph 14 above, as well as methods used and underlying assumptions, with the purpose of helping to prioritize

---

[7] Even if emissions are considered to be negligible, Parties should either report the emission estimate if calculated or use the notation key "NE".

efforts to improve the accuracy of national inventories in the future and guide decisions on methodological choice. This information should be presented using tables 6.1 and 6.2 of the IPCC good practice guidance. In addition, Annex I Parties should indicate in these tables those sources that have been identified as key sources in their inventory. If the methods used to estimate the level of uncertainty depart from the IPCC good practice guidance, these methods should be described.

Recalculations

33. Recalculations of previously submitted estimates of emissions and removals as a result of changes in methodologies, changes in the manner in which emission factors and activity data are obtained and used, or the inclusion of new sources or sinks which have existed since the base year but were not previously reported, should be reported for the base year and all subsequent years up to the year in which the recalculations are made.

34. Recalculations should be reported in the NIR, with explanatory information including justification for recalculations, and in the relevant CRF tables. Annex I Parties should also provide explanations for those cases in which they have not recalculated an estimate when such a recalculation is called for in the IPCC good practice guidance. Information on the procedures used for performing the recalculations, changes in the calculation methods, emission factors and activity data used, and the inclusion of sources or sinks not previously covered, should be reported with an indication of the relevant changes in each source or sink category where these changes have taken place. For key sources, Annex I Parties should include this information in the NIR, as indicated in paragraph 41 below.

35. Annex I Parties should report any other changes in estimates of emissions and removals, regardless of magnitude, and clearly indicate the reason for the changes compared with previously submitted inventories, e.g., error correction, statistical or editorial changes or reallocation of sources, using the corresponding CRF table, as indicated in paragraph 47 below and outlined in the annex II to these guidelines.

QA/QC

36. Annex I Parties shall report in the NIR on their QA/QC plan and give information on QA/QC procedures already implemented or to be implemented in the future.

Adjustments[8]

37. Inventories are to be reported without adjustments relating, for example, to climate variations or trade patterns of electricity. If Annex I Parties, in addition, carry out such adjustments to inventory data, they should be reported separately and in a transparent manner, with clear indications of the method followed.

2. National inventory report

38. Annex I Parties shall submit to the COP, through the secretariat, an NIR containing detailed and complete information on their inventories. The NIR should ensure transparency and contain sufficiently detailed information to enable the inventory to be reviewed. This information should cover the entire time series, from the base year[9] to the latest inventory year, and any changes to previously submitted inventories.

8 The adjustments referred to here relate, for example, to climate variations or trade patterns of electricity. They do not refer to adjustments under Article 5, paragraph 2, of the Kyoto Protocol.

9 According to the provisions of Article 4.6 of the Convention and decisions 9/CP.2 and 11/CP.4, some Parties with economies in transition are allowed to use base years other than 1990, as mentioned in paragraph 8 above.

39. Each year, an updated NIR shall be electronically submitted in its entirety to the COP, through the secretariat, in accordance with the relevant decisions of the COP; in instances where Annex I Parties have produced published hard copy versions of their NIR, they are also encouraged to submit copies to the secretariat.

40. The NIR shall include annual inventory information, submitted in accordance with paragraph 38 above.

41. The NIR should include:

(a) Descriptions, references and sources of information of the specific methodologies, assumptions, emission factors and activity data, as well as the rationale for their selection. It also should include an indication of the level of complexity (IPCC tiers) applied and a description of any national methodology used by the Annex I Party, as well as information on anticipated future improvements. For key sources, an explanation should be provided if the recommended methods from the appropriate decision tree in the IPCC good practice guidance are not used. In addition, activity data, emission factors and related information should be documented in accordance with the IPCC good practice guidance.

(b) A description of the national key sources as indicated in paragraph 30,[10] including:

(i) Reference to the key source tables in the CRF;

(ii) Information on the level of source category disaggregation used and its rationale;

(iii) Additional information relating to the methodology used for identifying key sources;

(c) With regard to possible double counting or non-counting of emissions, an indication in the corresponding sectoral part of the NIR:

(i) Whether feedstocks and non-energy use of fuels have been accounted for in the inventory, and if so, where they have been accounted for in the energy or industrial processes sector;

(ii) Whether CO_2 from agricultural soils has been estimated and if so, where it has been accounted for in the agriculture sector (under category 4.D – Agricultural soils) or in the land-use change and forestry (LUCF) sector (category 5.D – CO_2 emissions and removals from soil);

(iii) Whether emissions of CO_2 corresponding to atmospheric oxidation of CO, NMVOCs and CH_4 emissions from non-combustion and from non-biogenic processes, such as solvent use, coal mining and handling, venting and leakages of fossil fuels, have been accounted for in the inventory;

(iv) Information on source or sink categories excluded or potentially excluded, including efforts to develop estimates for future submissions;

[10] The secretariat will also perform a standardized key source determination for all Parties, based on table 7.1 of the IPCC good practice guidance. Parties may also use this approach if it is consistent with the way they prepare their inventories.

(d) Background data used to estimate emissions and removals from the LUCF sector to enhance transparency;[11]

(e) Information on how the effects of CO_2 capture from flue gases and subsequent CO_2 storage are accounted for in the inventory;

(f) Information on uncertainties, as requested in paragraph 32 above;

(g) Information on any recalculations relating to previously submitted inventory data, as requested in paragraphs 33 to 35 above, including changes in methodologies, sources of information and assumptions, as well as recalculations in response to the review process;

(h) Information on changes from previous years, not related to recalculations, including the changes in methodologies, sources of information and assumptions, as well as changes in response to the review process;

(i) Information on QA/QC as requested in paragraph 36 above, describing the QA/QC plan, and the QA/QC activities implemented for the entire inventory as well as for individual source categories, in particular key sources, and the entire inventory performed internally, as well as on the external reviews conducted, if any. Key findings on the quality of the input data, methods, processing and archiving and how they have been addressed, should be described;

(j) A description of the institutional arrangements for inventory preparation.

42. If any of the information required under paragraph 41 (a) to (h) above is provided in detail in the CRF, Annex I Parties should indicate in the NIR where in the CRF this information is provided.

43. The NIR should be reported in accordance with the outline contained in the annex I to these guidelines, ensuring that all information requested in paragraph 41 above is included.

3. Common reporting format

44. The common reporting format (CRF) is designed to ensure that Annex I Parties report quantitative data in a standardized format and to facilitate comparison of inventory data and trends among Annex I Parties. Explanation of information of a qualitative character should mainly be provided in the NIR rather than in the CRF tables. Such explanatory information should be cross-referenced to the specific section of the NIR.

45. Annex I Parties shall submit annually to the COP, through the secretariat, the information required in the CRF as contained in the annex II to these guidelines. This information shall be electronically submitted on an annual basis in its entirety to the COP, through the secretariat, in accordance with the relevant decisions of the COP.

46. The CRF is a standardized format for reporting estimates of greenhouse gas emissions and removals and other relevant information. The CRF allows for the improved handling of electronic submissions and facilitates the processing of inventory information and the preparation of useful technical analysis and synthesis documentation.

---

[11] The Subsidiary Body for Scientific and Technological Advice (SBSTA) may wish to consider this issue when guidance on good practice for the land use, land-use change and forestry sector has been completed by the IPCC and, as appropriate, expand this subparagraph in any subsequent revisions of these guidelines.

47. The CRF consists of:

(a) Summary, sectoral and trend tables for all greenhouse gas emissions and removals;

(b) Sectoral background data tables for reporting implied emission factors[12] and activity data, including:

(i) IPCC worksheet 1-1 containing estimates of CO_2 emissions from fuel combustion using the IPCC reference approach and a table for comparing estimates under this reference approach with estimates under the sectoral approach, as well as providing explanations of any significant differences;[13]

(ii) Tables for reporting fossil fuel consumption for non-energy feedstocks, international bunkers and multilateral operations;

(c) Tables for reporting, inter alia, key source categories, recalculations and completeness of the inventory.

48. The CRF should be reported in accordance with the tables included in the annex II to these guidelines, ensuring that all information requested in paragraph 47 above is included. In completing these tables Annex I Parties should:

(a) Provide the full CRF for the latest inventory year and for those years for which any change in any sector has been made. For years where no changes are made, resubmission of full CRF tables is not necessary, but a reference should be made to the inventory submission in which the unchanged data were reported originally. Annex I Parties should ensure that a full and time-series consistent set of CRF tables is annually available for the entire time series from the base year onwards;

(b) Provide the CRF trend tables covering inventory years for the entire time series in one submission only, that is, in the CRF for the last inventory year;

(c) Provide completeness tables in one submission only if the information applies to all years. If the information in these tables differs for each reported year, then either the tables or information on the specific changes must be provided for each year in the CRF;

(d) Use the documentation boxes provided at the foot of the sectoral report and background data tables to provide cross-references to detailed explanations in the NIR, or any other information, as specified in those boxes.

49. Annex I Parties should provide the information requested in the additional information boxes. Where the information called for is inappropriate because of the methodological tier used by the Annex I Party, the corresponding cells should be completed using the notation key “NA”. In such cases, the Annex I Parties should cross-reference in the documentation box the relevant section in the NIR where equivalent information can be found.

50. Annex I Parties should use the notation keys, as specified in paragraph 28 above, in all tables of the CRF, to fill in the cells where no quantitative data are directly entered. Using the notation keys in

---

12 The sectoral background tables were designed to allow calculation of implied emission factors. These are top-down ratios between an Annex I Party's emission estimates and activity data at the level of aggregation given by the tables. The implied emission factors are intended solely for purposes of data comparison. They will not necessarily be the emission factors actually used in the original emission estimate, unless this was a simple multiplication based on the same aggregate activity data used to calculate the implied emission factor.

13 Detailed explanations should be included in the NIR.

this way facilitates the assessment of the completeness of an inventory. Specific guidance is provided on how notation keys should be used in each CRF table where qualitative information is required.

G. Record keeping

51. Annex I Parties should gather and archive all relevant inventory information for each year, including all disaggregated emission factors, activity data and documentation on how these factors and data were generated, including expert judgement where appropriate, and how they have been aggregated for reporting in the inventory. This information should allow reconstruction of the inventory by the expert review teams, inter alia. Inventory information should be archived from the base year and should include corresponding data on the recalculations applied. The “paper trail”, which can include spreadsheets or databases used to compile inventory data, should enable estimates of emissions and removals to be traced back to the original disaggregated emission factors and activity data. Also, relevant supporting documentation related to QA/QC implementation, uncertainty evaluation, or key source analyses should be kept on file. This information should also facilitate the process of clarifying inventory data in a timely manner when the secretariat prepares annual compilations of inventories or assesses methodological issues. Annex I Parties are encouraged to collect and gather the information in a single national inventory facility or, at least, to keep the number of facilities to a minimum.

H. Systematic updating of the guidelines

52. These UNFCCC reporting guidelines on annual inventories shall be reviewed and revised, as appropriate, in accordance with decisions of the COP on this matter.

I. Language

53. The national inventory report shall be submitted in one of the official languages of the United Nations. Annex I Parties are also encouraged to submit, where relevant, a translation of the national inventory report into English.

Table 1. 1995 IPCC global warming potential (GWP) values[a] based on the effects of greenhouse gases over a 100-year time horizon

Greenhouse gas	Chemical formula	1995 IPCC GWP
Carbon dioxide	CO_2	1
Methane	CH_4	21
Nitrous oxide	N_2O	310
	Hydrofluorocarbons (HFCs)	
HFC-23	CHF_3	11 700
HFC-32	CH_2F_2	650
HFC-41	CH_3F	150
HFC-43-10mee	$C_5H_2F_{10}$	1 300

[a] As provided by the IPCC in its second assessment report.

Annex I

STRUCTURE OF NATIONAL INVENTORY REPORT

EXECUTIVE SUMMARY

ES.1. Background information on greenhouse gas inventories and climate change (e.g., as it pertains to the national context, to provide information to the general public)
ES.2. Summary of national emission and removal related trends
ES.3. Overview of source and sink category emission estimates and trends
ES.4. Other information (e.g., indirect greenhouse gases)

Chapter 1: INTRODUCTION

1.1. Background information on greenhouse gas inventories and climate change (e.g., as it pertains to the national context, to provide information to the general public)
1.2. A description of the institutional arrangement for inventory preparation
1.3. Brief description of the process of inventory preparation (e.g., data collection, data processing, data storage)
1.4. Brief general description of methodologies and data sources used
1.5. Brief description of key source categories
1.6. Information on the QA/QC plan including verification and treatment of confidentiality issues where relevant
1.7. General uncertainty evaluation, including data on the overall uncertainty for the inventory totals
1.8. General assessment of the completeness (with reference to annex 5 of the structure of the national inventory report (NIR))

Chapter 2: TRENDS IN GREENHOUSE GAS EMISSIONS

Information should be provided in this chapter that provides an overview of emission trends, but it is not necessary to repeat information that is provided in the sector chapters and in the common reporting format (CRF) trend tables.

2.1. Description and interpretation of emission trends for aggregated greenhouse gas emissions
2.2. Description and interpretation of emission trends by gas
2.3. Description and interpretation of emission trends by source
2.4. Description and interpretation of emission trends for indirect greenhouse gases and SO_2

Chapters 3–9: *(e.g. SECTOR NAME (CRF sector number))*

The structure outlined below should be followed in each of the following sectoral chapters. The information should be reported following the IPCC sectors.

3.1. Overview of sector (e.g., quantitative overview and description)
3.2. *Source category* (CRF source category number)

For each IPCC source category (i.e., at the level of the table Summary 1.A of the CRF, or the level at which IPCC methods are described, or at the level that the Annex I Party estimates its greenhouse gas emissions) the following information should be provided:

- 3.2.1. Source category description (e.g., characteristics of sources)
- 3.2.2. Methodological issues (e.g., choice of methods/activity data/emission factors, assumptions, parameters and conventions underlying the emission and removal estimates – the rationale for their selection, any specific methodological issues (e.g. description of national methods))
- 3.2.3. Uncertainties and time-series consistency
- 3.2.4. Source-specific QA/QC and verification, if applicable
- 3.2.5. Source-specific recalculations, if applicable, including changes made in response to the review process
- 3.2.6 Source-specific planned improvements, if applicable (e.g., methodologies, activity data, emission factors, etc.), including those in response to the review process

Annex I Parties may report some of the information requested above in an aggregate form for some/several source categories if the same methodology, activity data and/or emission factors are used, in order to avoid repetition of information. For key source categories, the information should be detailed in order to enable a thorough review of the inventory.

Chapter 3: ENERGY (CRF sector 1)

In addition, the energy information should include the following:

Fuel combustion (CRF 1.A), including detailed information on:

- Comparison of the sectoral approach with the reference approach
- International bunker fuels
- Feedstocks and non-energy use of fuels
- CO_2 capture from flue gases and subsequent CO_2 storage
- Country-specific issues

Fugitive emissions from solid fuels and oil and natural gas (CRF 1.B)

Chapter 4: INDUSTRIAL PROCESSES (CRF sector 2)

Chapter 5: SOLVENT AND OTHER PRODUCT USE (CRF sector 3)

Chapter 6: AGRICULTURE (CRF sector 4)

Chapter 7: LUCF (CRF sector 5)

Chapter 8: WASTE (CRF sector 6)

Chapter 9: OTHER (CRF sector 7) (if applicable)

In addition, information previously included in the additional information and the documentation boxes of the CRF version for the trial period (FCCC/CP/1999/7) should be included and expanded in the NIR, where relevant, as specified in the appendix to this proposed structure.

Chapter 10: RECALCULATIONS AND IMPROVEMENTS

Information should be provided in this chapter that provides an overview of recalculations and improvements made to the inventory, but it is not necessary to repeat information that is provided in the sector chapters, specifically the source specific information to be provided, and in particular, Annex I Parties should cross-reference information provided in the sector chapters.

10.1. Explanations and justifications for recalculations
10.2. Implications for emission levels
10.3. Implications for emission trends, including time series consistency
10.4 Recalculations, including in response to the review process, and planned improvements to the inventory (e.g., institutional arrangements, inventory preparation)

REFERENCES

ANNEXES TO THE NATIONAL INVENTORY REPORT

Annex 1: Key sources
- Description of methodology used for identifying key sources
- Reference to the key source tables in the CRF
- Information on the level of disaggregation
- Tables 7.A1 - 7.A3 of the IPCC good practice guidance[1]

Annex 2: Detailed discussion of methodology and data for estimating CO_2 emissions from fossil fuel combustion

Annex 3: Other detailed methodological descriptions for individual source or sink categories (where relevant)

Annex 4: CO_2 reference approach and comparison with sectoral approach, and relevant information on the national energy balance

Annex 5: Assessment of completeness and (potential) sources and sinks of greenhouse gas emissions and removals excluded

Annex 6: Additional information to be considered as part of the NIR submission (where relevant) or other useful reference information

Annex 7: Tables 6.1 and 6.2 of the IPCC good practice guidance[2]

Annex 8: Other annexes - (Any other relevant information – optional).

---

[1] This item has been added for consistency with the provisions in paragraph 30 of these guidelines.
[2] This item has been added for consistency with the provisions in paragraphs 32 and 41(f) of these guidelines.

Appendix A

ADDITIONAL GUIDANCE ON SECTORAL REPORTING TO BE INCLUDED IN THE CORRESPONDING SECTION OF THE NIR

This appendix provides guidance on additional information that Annex I Parties could include in their NIR in order to facilitate the review of the inventory. This list is not exhaustive. Additional information may be included in the NIR, depending on the Annex I Party's national approach for estimating greenhouse gas emissions and removals.

Energy

Fuel combustion
More specific information than that required in CRF table 1.A(a) could be provided, e.g.,

- Autoproduction of electricity
- Urban heating (in manufacturing industries, commercial and residential sectors).

Fugitive fuel emissions
Coal mining:
More specific information than that required in CRF table 1.B.1 could be provided, e.g.

- Number of active underground mines
- Number of mines with drainage (recovery) systems.

Oil and natural gas
More specific information than that required in CRF table 1.B.2 could be provided, e.g.

- Pipeline length
- Number of oil wells
- Number of gas wells
- Gas throughput[1]
- Oil throughput[1]

Industrial processes

Metal production
More specific information than is required in CRF table 2(I).A-G could be provided, e.g., data on virgin and recycled steel production.

Potential emissions of halocarbons and SF_6
In CRF table 2(II)s2, reporting of "production" refers to production of new chemicals. Recycled substances could be included in that table, but it should be ensured that double counting of emissions is avoided. Relevant explanations should be provided in the NIR.

[1] In the context of oil and gas production, throughput is a measure of the total production, such as barrels per day of oil, or cubic metres of gas per year. Specify the units of the reported values. Take into account that these values should be consistent with the activity data reported under production in table 1.B.2 of the CRF.

PFCs and SF_6 from metal production / Production of halocarbons and SF_6
The type of activity data used is to be specified in CRF tables 2(II).C-E (under column “description”). Where applying tier 1b (for 2.C Metal production), tier 2 (for 2.E Production of halocarbons and SF_6) and country-specific methods, any other relevant activity data used should be specified.

Consumption of HFCs, PFCs and SF_6
With regard to activity data reported in CRF table 2(II).F (“Amount of fluid remaining in products at decommissioning”), Annex I Parties should provide in the NIR information on the amount of the chemical recovered (recovery efficiency) and other relevant information used in the emission estimation.

CRF table 2.(II).F provides for reporting of the activity data and emission factors used to calculate actual emissions from consumption of halocarbons and SF_6 using the "bottom-up approach" (based on the total stock of equipment and estimated emission rates from this equipment). Some Annex I Parties may prefer to estimate their actual emissions following the alternative "top-down approach" (based on annual sales of equipment and/or gas). Those Annex I Parties should provide the activity data used in that CRF table and provide any other relevant information in the NIR. Data these Annex I Parties should provide include:

- The amount of fluid used to fill new products
- The amount of fluid used to service existing products
- The amount of fluid originally used to fill retiring products (the total nameplate capacity of retiring products)
- The product lifetime
- The growth rate of product sales, if this has been used to calculate the amount of fluid originally used to fill retiring products.

Alternatively, Annex I Parties may provide alternative formats with equivalent information.

Solvents and other product use

The IPCC Guidelines do not provide methodologies for the calculation of emissions of N_2O from solvent and other product use. If reporting such data in the CRF, Annex I Parties should provide additional information (activity data and emission factors) used to make these estimates in the NIR.

Agriculture

Cross-cutting
Annex I Parties should provide livestock population data in CRF table 4.A. Any further disaggregation of these data, e.g. for regions, for type (according to the classification recommended in the IPCC good practice guidance), could be provided in the NIR, where relevant**.** Consistent livestock population data should be used in the relevant CRF tables to estimate CH_4 emissions from enteric fermentation, CH_4 and N_2O emissions from manure management, N_2O emissions from soils, and N_2O emissions associated with manure production and use, as well as emissions from the use of manure as fuel and sewage-related emissions reported in the waste sector.

Enteric fermentation
More specific information than is required in CRF table 4.A could be provided, e.g., parameters relevant to the application of good practice guidance.

Manure management
More specific information than is required in CRF tables 4.B(a) and 4.B(b) could be provided, e.g., parameters relevant to the application of the IPCC good practice guidance. Information required in the additional information table may not be directly applicable to country-specific methods developed for methane conversion factor (MCF) calculations. If relevant data cannot be provided in the additional information box, information on how the MCF are derived should be described in the NIR.

Rice cultivation
More specific information than is required in CRF table 4.C could be provided. For example, when disaggregating by more than one region within a country and/or by growing season, provide additional information on disaggregation and related data in the NIR. Where available, provide activity data and scaling factors by soil type and rice cultivar in the NIR.

Agricultural soils
More specific information than is required in CRF table 4.D could be provided. For example,

- The IPCC Guidelines do not provide methodologies for the calculation of CH_4 emissions or removals by agricultural soils. If reporting such data, Annex I Parties should provide in the NIR additional information (activity data and emission factors) used to make these estimates;
- Annex I Parties which choose to account for CO_2 emissions and removals from agricultural soils under the agriculture sector (4.D Agricultural soils) should report background information on CO_2 emissions and removals estimates from agricultural soils (activity data, emissions factors) in the NIR;
- In addition to the data required in the additional information box of table 4.D, disaggregated values for $Frac_{GRAZ}$ according to animal type, and for $Frac_{BURN}$ according to crop types, should be provided in the NIR.

Prescribed burning of savannas and field burning of agricultural residues
More specific information than is required in CRF tables 4.E and 4.F could be provided. For example, the IPCC Guidelines do not provide methodologies for the calculation of CO_2 emissions from savanna burning or agricultural residues burning. If reporting such data, Annex I Parties should provide in the NIR additional information (activity data and emission factors) used to make these estimates.

Waste

Solid waste disposal and waste incineration
More specific information than is required in CRF tables 6.A and 6.C could be provided, e.g.,

- All relevant information used in the calculation should be provided in the NIR, if it is not already included in the additional information box of the CRF
- Composition of landfilled waste (%), according to paper and paperboard, food and garden waste, plastics, glass, textiles, other (specify according to inert or organic waste, respectively)
- Fraction of wastes recycled
- Fraction of wastes incinerated
- Number of solid waste disposal sites recovering CH_4.

Waste-water handling
More specific information than is required in CRF table 6.B could be provided. For example, with regard to data on N_2O from waste-water handling to be reported in CRF table 6.B, Annex I Parties using other methods for estimation of N_2O emissions from human sewage or waste-water treatment should provide in the NIR corresponding information on methods, activity data and emission factors used.

Annex II

COMMON REPORTING FORMAT[1]

Notes on the common reporting format

1. The common reporting format (CRF) is an integral part of the national inventory submission. It is designed to ensure that Annex I Parties report quantitative data in a standardized format, and to facilitate the comparison of inventory data across Annex I Parties. Details regarding any information of a non-quantitative character should be provided in the NIR.

2. The information provided in the CRF is aimed at enhancing the comparability and transparency of inventories by facilitating, inter alia, activity data and implied emission factor (IEF) cross-comparisons among Annex I Parties, and easy identification of possible mistakes, misunderstandings and omissions in the inventories.

3. As stated in these reporting guidelines, the CRF consists of summary report and sectoral report tables from the Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories (IPCC Guidelines) plus newly developed sectoral background data tables and other tables that are consistent with the IPCC Guidelines and the IPCC good practice guidance.

4. Some sectoral background tables call for the calculation of IEFs. These are top-down ratios between the Annex I Party's emissions estimate and aggregate activity data. The IEFs are intended solely for purposes of comparison. They will not necessarily be the emission factors actually used in the original emissions estimate, unless of course this was a simple multiplication based on the same aggregate activity data used to calculate the IEF.

5. Consistent with the IPCC Guidelines, memo items, such as emissions estimates from international marine and aviation bunker fuels, CO_2 emissions from biomass and emissions from multilateral operations, should be reported in the appropriate tables, but not included in the national totals.

6. Annex I Parties should use the documentation boxes at the foot of the tables to provide specific references to the relevant sections of the NIR where full details for a given sector/source category are to be provided.

7. Annex I Parties should fill in all the cells calling for emissions or removals estimates, activity data, or emission factors. Notation keys, as described in paragraph 28 of the reporting guidelines, should be used where data have not been entered.

8. In the sectoral background tables, below the source category "Other", an empty row indicates that country-specific source categories may be added. These source categories will automatically be included in the sectoral report tables.

9. Annex I Parties should complete the data in the additional information boxes. Where the information called for is inappropriate because of the methodological tier used by the Annex I Party, the corresponding cells should be completed using the indicator "NA".

---

[1] The document FCCC/SBSTA/2002/L.5/Add.2, which contains the UNFCCC reporting guidelines on annual inventories, includes on pages 23 to 27 a descriptive section on agreed changes to the tables of the common reporting format . The complete tables were published separately as document FCCC/WEB/SBSTA/2002/1 prior to the eighth session of the Conference of the Parties. Because the complete common reporting format tables with the changes are now included in this document (beginning on page 25), the descriptive section has been deleted from this final version.

10. Table 5 (the land-use change and forestry sectoral report) should be completed by Annex I Parties. The corresponding sectoral background tables 5.A–D follow the IPCC Guidelines and should be completed by Annex I Parties that use IPCC default methods. Annex I Parties not using the IPCC default methods are encouraged to provide background data and descriptions for the methodologies used to estimate emissions/removals from the LUCF sector in the NIR in order to enhance transparency. Alternative formats for tables 5.A–D will be considered after the IPCC has developed the good practice guidance for the LULUCF sector.

11. Neither the order nor the notations of the columns, rows or cells should be changed in the tables as this will complicate data compilation. Any additions to the existing disaggregation of source and sink categories should be provided under "Other", if appropriate.

12. To simplify the layout of the tables and indicate clearly the specific reporting requirements for each table, only those cells that require entries by Annex I Parties have been left blank. Slight shading in cells indicates that they are expected to be filled in by software to be provided by the secretariat. However, Annex I Parties that choose not to use any software for completing the CRF would have to provide entries in those cells as well.

13. As in the current CRF, dark shading has been used in those cells that are not expected to contain any information.

List of tables

Explanatory note:

In order to avoid changes to the layout of the complex tables of the common reporting format, the tables have not been translated. The common reporting format is a standardized format to be used by Annex I Parties for electronic reporting of estimates of greenhouse gas emissions and removals and any other relevant information. Due to technical limitations, the layout of the printed version of the CRF in this document (e.g., size of tables and fonts) cannot be standardized. The list of tables in this document follows the order of tables in the electronic version of the CRF.

Memo Items: [(1)]							
International Bunkers							
Aviation							
Marine							
Multilateral Operations							
CO_2 Emissions from Biomass							

[(1)] Countries are asked to report emissions from international aviation and marine bunkers and multilateral operations, as well as CO_2 emissions from biomass, under Memo Items. These emissions should not be included in the national total emissions from the energy sector. Amounts of biomass used as fuel are included in the national energy consumption but the corresponding CO_2 emissions are not included in the national total as it is assumed that the biomass is produced in a sustainable manner. If the biomass is harvested at an unsustainable rate, net CO_2 emissions are accounted for as a loss of biomass stocks in the land-use change and forestry sector.

Documentation Box: Parties should provide detailed explanations on the energy sector in Chapter 3: Energy (CRF sector 1) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.

(1) If activity data are calculated using net calorific values (NCV) as specified by the IPCC Guidelines, write NCV in this column. If gross calorific values (GCV) are used, write GCV in this column.

(2) Accurate estimation of CH_4 and N_2O emissions depends on combustion conditions, technology and emission control policy, as well as on fuel characteristics. Therefore, caution should be used when comparing the implied emission factors across countries.

(3) Although carbon dioxide emissions from biomass are reported in this table, they will not be included in the total CO_2 emissions from fuel combustion. The value for total CO_2 from biomass is recorded in Table1 sheet 2 under the Memo Items.

(4) Use this cell to list all activities covered under "f. Other".

(5) Use this cell to list all activities covered under "e. Other transportation".

(6) Include military fuel use under this category.

(7) Use this cell to list activities covered under "1.A.5.a Other - stationary".

(8) Use this cell to list activities covered under "1.A.5.b Other - mobile".

Documentation Box:
• Parties should provide detailed explanations on the fuel combustion sub-sector in the corresponding part of Chapter 3: Energy (CRF sub-sector 1.A) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.
• If estimates are based on GCV, use this documentation box to provide reference to the relevant section of the NIR where the information necessary to allow the calculation of the activity data based on NCV can be found.
• If some derived gases (e.g. gas works gas, coke oven gas, blast furnace gas) are considered, use this documentation box to provide a reference to the relevant section of the NIR containing the information on the allocation of these derived gases under the above fuel categories (liquid, soild, gaseous, biomass and other fuels).

[1] To convert quantities in previous columns to energy units, use net calorific values (NCV) and write NCV in this column. If gross calorific values (GCV) are used, write GCV in this column.

[2] If data for Anthracite are not available separately, include with Other Bituminous Coal.

[3] BKB: Brown coal/peat briquettes.

Documentation Box: Parties should provide detailed explanations on the fuel combustion sub-sector, including information related to CO_2 from the Reference approach, in the corresponding part of Chapter 3: Energy (CRF sub-sector 1.A) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.

TABLE 1.A(c) COMPARISON OF CO_2 EMISSIONS FROM FUEL COMBUSTION
(Sheet 1 of 1)

Country
Year
Submission

FUEL TYPES	REFERENCE APPROACH			SECTORAL APPROACH [1]		DIFFERENCE [2]	
	Apparent energy consumption [3] (PJ)	Apparent energy consumption (excluding non-energy use and feedstocks) [4] (PJ)	CO_2 emissions (Gg)	Energy consumption (PJ)	CO_2 emissions (Gg)	Energy consumption (%)	CO_2 emissions (%)
Liquid Fuels (excluding international bunkers)							
Solid Fuels (excluding international bunkers) [5]							
Gaseous Fuels							
Other [5]							
Total [5]							

[1] "Sectoral approach" is used to indicate the approach (if different from the Reference approach) used by the Party to estimate CO_2 emissions from fuel combustion as reported in table 1.A(a), sheets 1-4.
[2] Difference in CO_2 emissions estimated by the Reference approach (RA) and the Sectoral approach (SA) (difference = 100% x ((RA-SA)/SA)). For calculating the difference in energy consumption between the two approaches, data as reported in the column "Apparent energy consumption (excluding non-energy use and feedstocks)" are used for the Reference approach.
[3] Apparent energy consumption data shown in this column are as in table 1.A(b).

[4] For the purposes of comparing apparent energy consumption from the Reference approach with energy consumption from the Sectoral approach, Parties should, in this column, subtract from the apparent energy consumption (Reference approach) the energy content corresponding to the fuel quantities used as feedstocks and/or for non-energy purposes, in accordance with the accounting of energy use in the Sectoral approach.

[5] Emissions from biomass are not included.

Note: The Reporting Instructions of the Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories require that estimates of CO_2 emissions from fuel combustion, derived using a detailed Sectoral approach, be compared to those from the Reference approach (Worksheet 1-1 of the IPCC Guidelines, Volume 2, Workbook). This comparison is to assist in verifying the Sectoral data.

Documentation Box:
• Parties should provide detailed explanations on the fuel combustion sub-sector, including information related to the comparison of CO_2 emissions calculated using the Sectoral approach with those calculated using the Reference approach, in the corresponding part of Chapter 3: Energy (CRF sub-sector 1.A) of the NIR. Use this documentation box to provide references to the relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.
• If the CO_2 emission estimates from the two approaches differ by more than 2 per cent, Parties should briefly explain the cause of this difference in this documentation box and provide a reference to the relevant section of the NIR where this difference is explained in more detail.

TABLE 1.A(d) SECTORAL BACKGROUND DATA FOR ENERGY
Feedstocks and Non-Energy Use of Fuels
(Sheet 1 of 1)

Country
Year
Submission

FUEL TYPE	ACTIVITY DATA AND RELATED INFORMATION		IMPLIED EMISSION FACTOR	ESTIMATE
	Fuel quantity (TJ)	Fraction of carbon stored	Carbon emission factor (t C/TJ)	Carbon stored in non-energy use of fuels (Gg C)
Naphtha [1]				
Lubricants				
Bitumen				
Coal Oils and Tars (from Coking Coal)				
Natural Gas[1]				
Gas/Diesel Oil [1]				
LPG [1]				
Ethane [1]				
Other *(please specify)*				
Total				
Total amount of C and CO_2 from feedstocks and non-energy use of fuels that is included as emitted CO_2 in the Reference approach				

Additional information [a]

CO_2 not emitted ($Gg\ CO_2$)	Subtracted from energy sector *(specify source category)*

[1] Enter data for those fuels that are used as feedstocks (fuel used as raw materials for manufacture of products such as plastics or fertilizers) or for other non-energy use (fuels not used as fuel or transformed into another fuel (e.g. bitumen for road construction, lubricants)).

[a] The fuel lines continue from the table to the left.

Documentation box: A fraction of energy carriers is stored in such products as plastics or asphalt. The non-stored fraction of the carbon in the energy carrier or product is oxidized, resulting in carbon dioxide emissions, either during use of the energy carriers in the industrial production (e.g. fertilizer production), or during use of the products (e.g. solvents, lubricants), or in both (e.g. monomers). To report associated emissions, use the above table, filling in an extra table, as shown below.

Associated CO_2 emissions (Gg)	Allocated under *(Specify source category, e.g. Waste Incineration)*

• Parties should provide detailed explanations on the fuel combustion sub-sector, including information related to feedstocks, in the corresponding part of Chapter 3: Energy (CRF sub-sector 1.A) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.

• The above table is consistent with the IPCC Guidelines. Parties that take into account the emissions associated with the use and disposal of these feedstocks could continue to use their methodology, but should indicate this in this documentation box and provide a reference to the relevant section of the NIR where further explanation can be found.

TABLE 1.B.1 SECTORAL BACKGROUND DATA FOR ENERGY
Fugitive Emissions from Solid Fuels
(Sheet 1 of 1)

Country
Year
Submission

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	ACTIVITY DATA	IMPLIED EMISSION FACTORS		EMISSIONS		
	Amount of fuel produced	CH_4 [1]	CO_2	CH_4		CO_2
				Recovery/Flaring [2]	Emissions [3]	
	(Mt)	(kg/t)		(Gg)

Mining Activities						
Post-Mining Activities						
ii. Surface Mines[4]						
Mining Activities						
Post-Mining Activities						
1. B. 1. b. Solid Fuel Transformation						
1. B. 1. c. Other *(please specify)* [5]						

(1) The IEFs for CH_4 are estimated on the basis of gross emissions as follows: (CH_4 emissions + amounts of CH_4 flared/recovered) / activity data.

(2) Amounts of CH_4 drained (recovered), utilized or flared.

(3) Final CH_4 emissions after subtracting the amounts of CH_4 utilized or recovered.

(4) In accordance with the IPCC Guidelines, emissions from Mining Activities and Post-Mining Activities are calculated using the activity data of the amount of fuel produced for Underground Mines and Surface Mines.

(5) This category is to be used for reporting any other solid fuel-related activities resulting in fugitive emissions, such as emissions from abandoned mines and waste piles.

Note: There are no clear references to the coverage of 1.B.1.b. and 1.B.1.c. in the IPCC Guidelines. Make sure that the emissions entered here are not reported elsewhere. If they are reported under another source category, indicate this by using notation key IE and making the necessary reference in Table 9 (completeness).

Documentation box:
• Parties should provide detailed explanations on the fugitive emissions from source category 1.B.1 Solid fuels, in the corresponding part of Chapter 3: Energy (CRF source category 1.B.1) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table. • Regarding data on the amount of fuel produced entered in the above table, specify in this documentation box whether the fuel amount is based on the run-of-mine (ROM) production or on the saleable production. • If entries are made for "Recovery/Flaring", indicate in this documentation box whether CH_4 is flared or recovered and provide a reference to the section in the NIR where further details on recovery/flaring can be found. • If estimates are reported under 1.B.1.b. and 1.B.1.c., use this documentation box to provide information regarding activities covered under these categories and to provide a reference to the section in the NIR where the background information can be found.

Flaring									
i. Oil	*(e.g. PJ gas consumption)*								
ii. Gas	*(e.g. PJ gas consumption)*								
iii. Combined									
1.B.2.d. Other *(please specify)* [6]									

[1] Specify the activity data used in the Description column (see examples). Specify the unit of the activity data in the Unit column using one of the following units: PJ, Tg, 10^6 m^3, 10^6 bbl/yr, km, number of sources (e.g. wells).
[2] The unit of the implied emission factor will depend on the unit of the activity data used, and is therefore not specified in this column.
[3] Use the category also to cover emissions from combined oil and gas production fields. Natural gas processing and distribution from these fields should be included under 1.B.2.b.ii and 1.B.2.b.iv, respectively.
[4] If using default emission factors, these categories will include emissions from production other than venting and flaring.
[5] If using default emission factors, emissions from Venting and Flaring from all oil and gas production should be accounted for under Venting.
[6] For example, fugitive CO_2 emissions from production of geothermal power could be reported here.

Documentation box:
• Parties should provide detailed explanations on the fugitive emissions from source category 1.B.2 Oil and natural gas, in the corresponding part of Chapter 3: Energy (CRF source category 1.B.2) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.
• Regarding data on the amount of fuel produced entered in this table, specify in this documentation box whether the fuel amount is based on the raw material production or on the saleable production. Note cases where more than one type of activity data is used to estimate emissions.
• Venting and Flaring: Parties using the IPCC software could report venting and flaring emissions together, indicating this in this documentation box.
• If estimates are reported under "1.B.2.d Other", use this documentation box to provide information regarding activities covered under this category and to provide a reference to the section in the NIR where background information can be found.

Multilateral Operations [1]							

Additional information

Fuel consumption	Distribution [a] (per cent)	
	Domestic	International
Aviation		
Marine		

[a] For calculating the allocation of fuel consumption, the sums of fuel consumption for domestic navigation and aviation (Table 1.A(a)) and for international bunkers (Table 1.C) are used.

[1] Parties may choose to report or not report the activity data and implied emission factors for multilateral operations consistent with the principle of confidentiality stated in the UNFCCC reporting guidelines. In any case, Parties should report the emissions from multilateral operations, where available, under the Memo Items section of the Summary tables and in the Sectoral report table for energy.

Note: In accordance with the IPCC Guidelines, international aviation and marine bunker fuel emissions from fuel sold to ships or aircraft engaged in international transport should be excluded from national totals and reported separately for information purposes only.

Documentation box: • Parties should provide detailed explanations on the fuel combustion sub-sector, including international bunker fuels, in the corresponding part of Chapter 3: Energy (CRF sub-sector 1.A) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table. • Provide in this documentation box a brief explanation on how the consumption of international marine and aviation bunker fuels was estimated and separated from domestic consumption, and include a reference to the section of the NIR where the explanation is provided in more detail.

Potential/Actual emissions ratio																									

(1) In accordance with the UNFCCC reporting guidelines, HFC and PFC emissions should be reported for each relevant chemical. However, if it is not possible to report values for each chemical (i.e. mixtures, confidential data, lack of disaggregation), these columns could be used for reporting aggregate figures for HFCs and PFCs, respectively. Note that the unit used for these columns is Gg of CO_2 equivalent.

(2) Note that the units used in this table differ from those used in the rest of the Sectoral report tables, i.e. *t* instead of *Gg*.

(3) ODS: ozone-depleting substances

(4) Potential emissions of each chemical of halocarbons and SF_6 estimated using Tier 1a or Tier 1b of the IPCC Guidelines (Volume 3. Reference Manual, pp. 2.47-2.50). Where potential emission estimates are available in a disaggregated manner for the source categories F.1 to F.9, these should be reported in the NIR and a reference should be provided in the documentation box. Use table Summary 3 to indicate whether Tier 1a or Tier 1b was used.

(5) Production refers to production of new chemicals. Recycled substances could be included here, but avoid double counting of emissions. An indication as to whether recycled substances are included should be provided in the documentation box to this table.

(6) Relevant only for Tier 1b.

(7) Total actual emissions equal the sum of the actual emissions of each halocarbon and SF_6 from the source categories 2.C, 2.E, 2.F and 2.G as reported in sheet 1 of this table multiplied by the corresponding GWP values.

(8) Potential emissions of each halocarbon and SF_6 taken from row F(p) multiplied by the corresponding GWP values.

Note: As stated in the UNFCCC reporting guidelines, Parties should report actual emissions of HFCs, PFCs and SF_6, where data are available, providing disaggregated data by chemical and source category in units of mass and in CO_2 equivalent. Parties reporting actual emissions should also report potential emissions for the sources where the concept of potential emissions applies, for reasons of transparency and comparability. Gases with GWP values not yet agreed upon by the COP should be reported in Table 9 (b).

Documentation box:
• Parties should provide detailed explanations on the industrial processes sector in Chapter 4: Industrial processes (CRF sector 2) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table. • If estimates are reported under "2.G Other", use this documentation box to provide information regarding activities covered under this category and to provide reference to the section in the NIR where background information can be found.

TABLE 2(II). C, E SECTORAL BACKGROUND DATA FOR INDUSTRIAL PROCESSES
Metal Production; Production of Halocarbons and SF_6
(Sheet 1 of 1)

			HFC-23	SF_6	HFCs/PFCs *(as specified)*	HFC-23		SF_6		HFCs/PFCs		
						Emissions[3]	Recovery[4]	Emissions[3]	Recovery[4]	(specify chemical)	Emissions[3]	Recovery[4]
	Description [1]	(t)	(kg/t)			(t)						
E. Production of Halocarbons and SF_6												
1. By-product Emissions												
Production of HCFC-22												
Other *(specify activity)*												
2. Fugitive Emissions *(please specify activity)*												
3. Other *(please specify activity)*												

(1) Specify the activity data used as shown in the examples within parentheses.

(2) The implied emission factors (IEFs) are estimated on the basis of gross emissions as follows: IEF = (emissions + amounts recovered, oxidized, destroyed or transformed) / activity data.

(3) Final emissions are to be reported (after subtracting the amounts of emission recovery, oxidation, destruction or transformation).

(4) Amounts of emission recovery, oxidation, destruction or transformation.

Documentation box:
• Parties should provide detailed explanations on the industrial processes sector in Chapter 4: Industrial processes (CRF sector 2) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table. • Where only aggregate figures for activity data are provided, e.g. due to reasons of confidentiality (see footnote 1 to table 2(II)), a note indicating this should be provided in this documentation box. • Where applying Tier 1b (for source category 2.C), Tier 2 (for source category 2.E) and country-specific methods, specify any other relevant activity data used in this documentation box, including a reference to the section of the NIR where more detailed information can be found. • Use this documentation box for providing clarification on emission recovery, oxidation, destruction and/or transformation, and provide a reference to the section of the NIR where more detailed information can be found.

TABLE 2(II).F SECTORAL BACKGROUND DATA FOR INDUSTRIAL PROCESSES
Consumption of Halocarbons and SF_6
(Sheet 1 of 2)

Country
Year
Submission

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	ACTIVITY DATA *Amount of fluid*			IMPLIED EMISSION FACTORS			EMISSIONS		
	Filled into new manufactured products	In operating systems (average annual stocks)	Remaining in products at decommissioning	Product manufacturing factor	Product life factor	Disposal loss factor	From manufacturing	From stocks	From disposal
	(t)			(% per annum)			(t)		
1. Refrigeration[(1)]									
Air Conditioning Equipment									
Domestic Refrigeration *(Specify chemical)* [(1)]									
Commercial Refrigeration									
Transport Refrigeration									
Industrial Refrigeration									
Stationary Air-Conditioning									
Mobile Air-Conditioning									
2. Foam Blowing[(1)]									
Hard Foam									
Soft Foam									

(1) Under each of the listed source categories, specify the chemical consumed (*e.g. HFC-32)* as indicated under category Domestic Refrigeration; use one row per chemical.

Note: This table provides for reporting of the activity data and emission factors used to calculate actual emissions from consumption of halocarbons and SF_6 using the "bottom-up approach" (based on the total stock of equipment and estimated emission rates from this equipment). Some Parties may prefer to estimate actual emissions following the alternative "top-down approach" (based on annual sales of equipment and/or gas). Those Parties should provide the activity data used in the current format and any other relevant information needed to understand the content of the table in the documentation box at the end of sheet 2 to this table, including a reference to the section of the NIR where further details can be found. Those Parties should provide the following data in the NIR:

1. the amount of fluid used to fill new products,
2. the amount of fluid used to service existing products,
3. the amount of fluid originally used to fill retiring products (the total nameplate capacity of retiring products),
4. the product lifetime, and
5. the growth rate of product sales, if this has been used to calculate the amount of fluid originally used to fill retiring products.

In the NIR, Parties may provide alternative formats for reporting equivalent information with a similar level of detail.

TABLE 2(II).F SECTORAL BACKGROUND DATA FOR INDUSTRIAL PROCESSES
Consumption of Halocarbons and SF_6
(Sheet 2 of 2)

Country
Year
Submission

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	ACTIVITY DATA *Amount of fluid*			IMPLIED EMISSION FACTORS			EMISSIONS		
	Filled into new manufactured products	In operating systems (average annual stocks)	Remaining in products at decommissioning	Product manufacturing factor	Product life factor	Disposal loss factor	From manufacturing	From stocks	From disposal
	(t)			(% per annum)			(t)		
3. Fire Extinguishers *Specify chemical)* [(1)]									
4, Aerosols [(1)]									
Metered Dose Inhalers									
Other									
5. Solvents [(1)]									
6. Other applications using ODS[(2)] **substitutes** [(1)]									
7. Semiconductors [(1)]									
8. Electric Equipment[(1)]									
9. Other *(please specify)* [(1)]									

(1) Under each of the listed source categories, specify the chemical consumed (e.g. HFC-32) as indicated under category Fire Extinguishers; use one row per chemical.

(2) ODS: ozone-depleting substances.

Documentation box:
• Parties should provide detailed explanations on the industrial processes sector in Chapter 4: Industrial processes (CRF sector 2) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table. • Where only aggregate figures for activity data are provided, e.g. due to reasons of confidentiality (see footnote 1 to table 2(II)), a note indicating this should be provided in this documentation box. • With regard to data on the amounts of fluid that remained in retired products at decommissioning, use this documentation box to provide a reference to the section of the NIR where information on the amount of the chemical recovered (recovery efficiency) and other relevant information used in the emission estimation can be found. • Parties that estimate their actual emissions following the alternative top-down approach might not be able to report emissions using this table. As indicated in the note to sheet 1 of this table, Parties should in these cases, in the NIR, provide alternative formats for reporting equivalent information with a similar level of detail. References to the relevant section of the NIR should be provided in this documentation box.

TABLE 3 SECTORAL REPORT FOR SOLVENT AND OTHER PRODUCT USE
(Sheet 1 of 1)

Country
Year
Submission

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	CO_2	N_2O	NMVOC
	(Gg)		
Total Solvent and Other Product Use			
A. Paint Application			
B. Degreasing and Dry Cleaning			
C. Chemical Products, Manufacture and Processing			
D. Other			
1. Use of N_2O for Anaesthesia			
2. N_2O from Fire Extinguishers			
3. N_2O from Aerosol Cans			
4. Other Use of N_2O			
5. Other *(as specified in table 3.A-D)*			

Note: The quantity of carbon released in the form of NMVOCs should be accounted for in both the NMVOC and the CO_2 columns. Note that these quantites of NMVOCs should be converted into CO_2 equivalent emissions before being added to the CO_2 amounts in the CO_2 column.

Documentation box:
• Parties should provide detailed explanations on the solvent and other product use sector in Chapter 5: Solvent and other product use (CRF sector 3) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table. • The IPCC Guidelines do not provide methodologies for the calculation of emissions of N_2O from Solvent and Other Product Use. If reporting such data, Parties should provide additional information (activity data and emission factors) used to derive these estimates in the NIR, and provide in this documentation box a reference to the section of the NIR where this information can be found.

[(1)] The sum for cattle would be calculated on the basis of entries made under either option A (dairy and non-dairy cattle) or option B (mature dairy cattle, mature non-dairy cattle and young cattle).

[(2)] See footnote 4 to Summary 1.A of this common reporting format. Parties which choose to report CO_2 emissions and removals from agricultural soils under 4.D Agricultural Soils of the sector Agriculture should report the amount (in Gg) of these emissions or removals in table Summary 1.A of the CRF. References to additional information (activity data, emissions factors) reported in the NIR should be provided in the documentation box to table 4.D. In line with the corresponding table in the IPCC Guidelines (i.e. IPCC Sectoral Report for Agriculture), this table does not include provisions for reporting CO_2 estimates.

[(3)] Direct N_2O emissions from pasture, range and paddock manure are to be reported in the "4.D Agricultural Soils" category. All other N_2O emissions from animal manure are to be reported in the "4.B Manure Management" category. See also chapter 4.4 of the IPCC good practice guidance report.

Note: The IPCC Guidelines do not provide methodologies for the calculation of CH_4 emissions and CH_4 and N_2O removals from agricultural soils, or CO_2 emissions from prescribed burning of savannas and field burning of agricultural residues. Parties that have estimated such emissions should provide, in the NIR, additional information (activity data and emission factors) used to derive these estimates and include a reference to the section of the NIR in the documentation box of the corresponding Sectoral background data tables.

Documentation box:
• Parties should provide detailed explanations on the agriculture sector in Chapter 6: Agriculture (CRF sector 4) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table. • If estimates are reported under "4.G Other", use this documentation box to provide information regarding activities covered under this category and to provide reference to the section in the NIR where background information can be found.

TABLE 4.A SECTORAL BACKGROUND DATA FOR AGRICULTURE
Enteric Fermentation

Additional information (only for those livestock types for which Ttier 2 was used) [a]

Disaggregated list of animals [b] / Indicators:		Dairy Cattle	Non-Dairy Cattle	Other *(specify)*	
Weight	(kg)				
Feeding situation [c]					
Milk yield	(kg/day)				
Work	(h/day)				
Pregnant	(%)				
Digestibility of feed	(%)				

[a] See also Tables A-1 and A-2 of the IPCC Guidelines (Volume 3. Reference Manual, pp. 4.31-4.34). These data are relevant if Parties do not have data on average feed intake.

[b] Disaggregate to the split actually used. Add columns to the table if necessary.

[c] Specify feeding situation as pasture, stall fed, confined, open range, etc.

(1) Parties are encouraged to provide detailed livestock population data by animal type and region, if available, in the NIR, and provide reference to the relevant section in the documentation box below. Parties should use the same animal population statistics to estimate CH_4 emissions from enteric fermentation, CH_4 and N_2O from manure management, N_2O direct emissions from soil and N_2O emissions associated with manure production, as well as emissions from the use of manure as fuel, and sewage-related emissions reported in the waste sector.

(2) Y_m refers to the fraction of gross energy in feed converted to methane and should be given in per cent in this table.

(3) The implied emission factors will not be calculated until the corresponding emission estimates are entered directly into Table 4.

(4) Including data on dairy heifers, if available.

Documentation box:
• Parties should provide detailed explanations on the agriculture sector in Chapter 6: Agriculture (CRF sector 4) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table. • Indicate in this documentation box whether the activity data used are one year-estimates or a three-year average. • Provide a reference to the relevant section in the NIR, in particular with regard to: (a) disaggregation of livestock population (e.g. according to the classification recommended in the IPCC good practice guidance), including information on whether these data are one-year estimates or a three-year average. (b) parameters relevant to the application of IPCC good practice guidance.

4. Goats								
5. Camels and Llamas								
6. Horses								
7. Mules and Asses								
8. Swine								
9. Poultry								
10. Other livestock *(please specify)*								

[(1)] Climate regions are defined in terms of annual average temperature as follows: Cool = less than 15°C; Temperate = 15 - 25°C inclusive; and Warm = greater than 25°C (see Table 4.2 of the IPCC Guidelines (Volume 3, Reference Manual, p. 4.8)).

[(2)] VS = Volatile Solids; Bo = maximum methane producing capacity for manure IIPCC Guidelines (Volume 3, Reference Manual, p.4.23 and p.4.15); dm = dry matter. Provide average values for VS and Bo where original calculations were made at a more disagregated level of these livestock categories.

[(3)] Including data on dairy heifers, if available.

[(4)] The implied emission factors will not be calculated until the corresponding emission estimates are entered directly into Table 4.

Additional information (for Tier 2) [(a)]

Animal category	Indicator	Climate region	Animal waste management system						
			Anaerobic lagoon	Liquid system	Daily spread	Solid storage	Dry lot	Pasture range paddock	Other
Dairy Cattle	Allocation (%)	Cool							
		Temperate

		Warm							
Other livestock *(please specify)*	Allocation (%)	Cool							
		Temperate							
		Warm							
	MCF[(b)]	Cool							
		Temperate							
		Warm							

[(a)] The information required in this table may not be directly applicable to country-specific methods developed for MCF calculations. In such cases, information on MCF derivation should be described in the NIR and references to the relevant sections of the NIR should be provided in the documentation box.

[(b)] MCF = Methane Conversion Factor (IPCC Guidelines, (Volume 3. Reference Manual, p. 4.9)). If another climate region categorization is used, replace the entries in the cells with the climate regions for which the MCFs are specified.

Documentation box:
- Parties should provide detailed explanations on the agriculture sector in Chapter 6: Agriculture (CRF sector 4) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and further details are needed to understand the content of this table.
- Indicate in this documentation box whether the activity data used are one-year estimates or a three-year average.
- Provide a reference to the relevant section in the NIR, in particular with regard to:
  (a) disaggregation of livestock population (e.g. according to the classification recommended in the IPCC good practice guidance), including information on whether these data are one-year estimates or a three-year average.
  (b) parameters relevant to the application of IPCC good practice guidance;
  (c) information on how the MCF are derived, if relevant data could not be provided in the additional information box.

Agricultural Soils[1]

(Sheet 1 of 1)

Country

Year

Submission

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	ACTIVITY DATA AND OTHER RELATED INFORMATION		IMPLIED EMISSION FACTORS	EMISSIONS
	Description	Value kg N/yr	kg N_2O-N/kg N [2]	N_2O (Gg)
1. Direct Soil Emissions	**N input to soils**			
1. Synthetic Fertilizers	Nitrogen input from application of synthetic fertilizers			
2. Animal Manure Applied to Soils	Nitrogen input from manure applied to soils			
3. N-fixing Crops	Nitrogen fixed by N-fixing crops			
4. Crop Residue	Nitrogen in crop residues returned to soils			
5. Cultivation of Histosols [2]	Area of cultivated organic soils (ha/yr)			
6. Other direct emissions *(please specify)*				
2. Pasture, Range and Paddock Manure	**N excretion on pasture range and paddock**			
3. Indirect Emissions				
1. Atmospheric Deposition	Volatized N from fertilizers, animal manures and other			
2. Nitrogen Leaching and Run-off	N from fertilizers, animal manures and other that is lost through leaching and run-off			
4. Other *(please specify)*				

Additional information

Fraction [a]	Description	Value
$Frac_{BURN}$	Fraction of crop residue burned	
$Frac_{FUEL}$	Fraction of livestock N excretion in excrements burned for fuel	
$Frac_{GASF}$	Fraction of synthetic fertilizer N applied to soils that volatilizes as NH_3 and NOx	
$Frac_{GASM}$	Fraction of livestock N excretion that volatilizes as NH_3 and NOx	
$Frac_{GRAZ}$	Fraction of livestock N excreted and deposited onto soil during grazing	
$Frac_{LEACH}$	Fraction of N input to soils that is lost through leaching and run-off	
$Frac_{NCRBF}$	Fraction of total above-ground biomass of N-fixing crop that is N	
$Frac_{NCRO}$	Fraction of residue dry biomass that is N	
$Frac_{R}$	Fraction of total above-ground crop biomass that is removed from the field as a crop product	
Other fractions *(please specify)*		

[a] Use the definitions for fractions as specified in the IPCC Guidelines (Volume 3. Reference Manual, pp. 4.92 - 4.113) as elaborated by the IPCC good practice guidance (pp. 4.54 - 4.74).

[1] See footnote 4 to Summary 1.A. of this common reporting format. Parties that choose to report CO_2 emissions and removals from agricultural soils under 4.D. Agricultural Soils category should indicate the amount (in Gg) of these emissions or removals and relevant additional information (activity data, implied emissions factors) in the documentation box.

[2] To convert from N_2O-N to N_2O emissions, multiply by 44/28. Note that for cultivation of Histosols the unit of the IEF is kg N_2O-N/ha.

Documentation box:

• Parties should provide detailed explanations on the agriculture sector in Chapter 6: Agriculture (CRF sector 4) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.

• Provide a reference to the relevant section in the NIR, in particular with regard to:

(a) Background information on CO_2 emissions and removals estimates from agricultural soils, if accounted for under the agriculture sector;

(b) Background information on CH_4 emissions from agricultural soils, if accounted for under the agriculture sector;

(c) Disaggregated values for $Frac_{GRAZ}$ according to animal type, and for $Frac_{BURN}$ according to crop types;

(d) Full list of assumptions and fractions used.

1. Tropical Forests							
2. Temperate Forests							
3. Boreal Forests							
4. Grasslands/Tundra							
5. Other *(please specify)*							
C. Abandonment of Managed Lands							
1. Tropical Forests							
2. Temperate Forests							
3. Boreal Forests							
4. Grasslands/Tundra							
5. Other *(please specify)*							
D. CO_2 Emissions and Removals from Soil							
Cultivation of Mineral Soils							
Cultivation of Organic Soils							
Liming of Agricultural Soils							
Forest Soils							
Other *(please specify)* [(3)]							
E. Other *(please specify)*							

(1) Note that according to the IPCC Guidelines, for purposes of reporting, the signs for removals are always (-) and for emissions (+). Net CO_2 emissions/removals are calculated as follows: net CO_2 = CO_2 emissions + CO_2 removals. Note that this result is to be reported in table Summary 1.A, where a single number is to be placed in either the CO_2 emissions or the CO_2 removals column, as appropriate.

(2) Following the IPCC Guidelines, the harvested wood should be reported under Changes in Forest and Other Woody Biomass Stocks (Volume 3. Reference Manual, p.5.17).

(3) Include emissions from soils not reported under sections A, B and C.

Note: According to the IPCC Guidelines (Volume 3. Reference Manual, pp. 4.2, 4.87), CO_2 emissions from agricultural soils are to be included under Land-use change and forestry (LUCF). At the same time, the Summary Report 7A (Volume 1. Reporting Instructions, Tables.27) allows for reporting CO_2 emissions or removals from agricultural soils either in the Agriculture sector, under 4.D Agricultural soils or in the Land-use change and forestry sector under 5.D Emissions and removals from soil. Parties may choose either way to report emissions or removals from this source in the common reporting format, but the way they have chosen to report should be clearly indicated, by providing a brief explanation in the documentation boxes to Table 4D of the agriculture sector. Double-counting of these emissions or removals should be avoided. Parties should include these emissions or removals consistently in Table8(a) (Recalculation - Recalculated data) and Table10 (Emission trends).

Documentation box:
• Parties should provide detailed explanations on the land-use change and forestry sector in Chapter 7: Land-use change and forestry (CRF sector 5) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.
• If estimates are reported under "5.E Other", use this documentation box to provide information regarding activities covered under this category and to provide reference to the section in the NIR where background information can be found.

TABLE 5.A SECTORAL BACKGROUND DATA FOR LAND-USE CHANGE AND FORESTRY
Changes in Forest and Other Woody Biomass Stocks

GREENHOUSE GAS SOURCE AND SINK CATEGORIES			ACTIVITY DATA		IMPLIED EMISSION FACTORS	ESTIMATES
			Area of forest/biomass stocks (kha)	Average annual growth rate (t dm/ha)	Implied carbon uptake factor (t C/ha)	Carbon uptake increment (Gg C)
Tropical	Plantations	*Acacia spp.*				
		Eucalyptus spp.				
		Tectona grandis				
		Pinus spp				
		Pinus caribaea				
		Mixed Hardwoods				
		Mixed Fast-Growing Hardwoods				
		Mixed Softwoods				
	Other Forests	Moist				
		Seasonal				
		Dry				
	Other *(specify)*					
Temperate	Plantations					
	Commercial	Evergreen				
		Deciduous				
	Other *(specify)*					
Boreal						
			Number of trees (1000s of trees)	Annual growth rate (kt dm/1000 trees)	Carbon uptake factor (t C/tree)	Carbon uptake increment (Gg C)
Non-Forest Trees *(specify type)*						
					Total annual growth increment (Gg C)	
					Gg CO_2	

	Amount of biomass removed (kt dm)	Carbon emission factor (t C/t dm)	Carbon release (Gg C)
Total biomass removed in Commercial Harvest			
Traditional Fuelwood Consumed			
Total Other Wood Use			
		Total Biomass Consumption from Stocks [1] (Gg C)	
		Other Changes in Carbon Stocks [2] (Gg C)	
		Gg CO_2	

Net annual carbon uptake (+) or release (-) (Gg C)	
Net CO_2 emissions (-) or removals (+) (Gg CO_2)	

[1] Make sure that the quantity of biomass burned off-site is subtracted from this total.

[2] The net annual carbon uptake/release is determined by comparing the annual biomass growth versus annual harvest, including the decay of forest products and slash left during harvest. The IPCC Guidelines recommend default assumption that all carbon removed in wood and other biomass from forests is oxidized in the year of removal. The emissions from decay could be included under Other Changes in Carbon Stocks.

Note: Sectoral background data tables on Land-Use Change and Forestry should be filled in only by Parties using the IPCC default methodology.
Parties that use country-specific methods and models should report information on them in a transparent manner in the NIR.

Documentation box:
Parties should provide detailed explanations on the land-use change and forestry sector in Chapter 7: Land-use change and forestry (CRF sector 5) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.

Limestone $Ca(CO_3)$			
Dolomite $CaMg(CO_3)_2$			

Total annual net carbon emissions from agriculturally impacted soils (Gg C)	
Total annual net CO_2 emissions from agriculturally impacted soils (Gg CO_2)	

Additional information

Year	Climate [a]	Land-use/ management system [a]	Soil type: High activity soils	Low activity soils	Sandy	Volcanic	Wetland (Aquic)	Organic soil
			percent distribution (%)					
20 years prior	*(e.g. tropical, dry)*	*(e.g. savanna)*						
		(e.g. irrigated cropping)						
inventory year								

[a] These should represent the major types of land management systems per climate region present in the country as well as ecosystem types which were either converted to agriculture (e.g., forest, savanna, grassland) or have been derived from previous agricultural land-use (e.g., abandoned lands, reforested lands). Systems should also reflect differences in soil carbon stocks that can be related to differences in management (IPCC Guidelines, Volume 2. Workbook, Table 5-9, p. 5.26, and Appendix (pp. 5.31 - 5.38)).

[1] The information to be reported under Cultivation of Mineral Soils aggregates data per soil type over all land-use/management systems. This refers to land area data and to the emission estimates and implied emissions factors accordingly.

Note: Sectoral background data tables on Land-Use Change and Forestry should be filled in only by Parties using the IPCC default methodology. Parties that use country-specific methods and models should report information on them in a transparent manner in the NIR.

Documentation box: Parties should provide detailed explanations on the land-use change and forestry sector in Chapter 7: Land-use change and forestry (CRF sector 5) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.

TABLE 6 SECTORAL REPORT FOR WASTE

						Emissions (2)	Recovery (3)	
	(Gg)		%	(t /t MSW)		(Gg)		
1 Managed Waste Disposal on Land								
2 Unmanaged Waste Disposal Sites								
a. Deep (>5 m)								
b. Shallow (<5 m)								
3 Other *(please specify)*								

Additional information

Description	Value
Total population (1000s)(a)	
Urban population (1000s)(a)	
Waste generation rate (kg/capita/day)	
Fraction of MSW disposed to SWDS	
Fraction of DOC in MSW	
CH_4 oxidation factor (b)	
CH_4 fraction in landfill gas	
CH_4 generation rate constant (k) (c)	
Time lag considered (yr) (c)	

MSW - Municipal Solid Waste, SWDS - Solid Waste Disposal Site, MCF - Methane Correction Factor, DOC - Degradable Organic Carbon (IPCC Guidelines (Volume 3. Reference Manual, section 6.2.4)).
MSW includes household waste, yard/garden waste, commercial/market waste and organic industrial solid waste. MSW should not include inorganic industrial waste such as construction or demolition materials.

(1) The CH_4 implied emission factor (IEF) is calculated on the basis of gross CH_4 emissions, as follows: IEF = (CH_4 emissions + CH_4 recovered)/annual MSW at the SWDS.
(2) Actual emissions (after recovery).
(3) CH_4 recovered and flared or utilized.
(4) Under Solid Waste Disposal, CO_2 emissions should be reported only when the disposed waste is combusted at the disposal site as a management practice. CO_2 emissions from non-biogenic wastes are included in the total emissions, whereas the CO_2 emissions from biogenic wastes are not included in the total emissions.

(a) Specify whether total or urban population is used and the rationale for doing so.
(b) See IPCC Guidelines (Volume 3. Reference Manual, p. 6.9).
(c) Only for Parties using Tier 2 methods.

TABLE 6.C SECTORAL BACKGROUND DATA FOR WASTE
Waste Incineration
(Sheet 1 of 1)

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	ACTIVITY DATA	IMPLIED EMISSION FACTOR			EMISSIONS		
	Amount of incinerated wastes	CO_2	CH_4	N_2O	CO_2 (1)	CH_4	N_2O
	(Gg)	(kg/t waste)			(Gg)		
Waste Incineration							
a. Biogenic (1)							
b. Other (non-biogenic - *please specify*) (1), (2)							

(1) Under Solid Waste Disposal, CO_2 emissions should be reported only when the disposed waste is combusted at the disposal site as a management practice. CO_2 emissions from non-biogenic wastes are included in the total emissions, while the CO_2 emissions from biogenic wastes are not included in the total emissions.

(2) Enter under this source category all types of non-biogenic wastes, such as plastics.

Note: Only emissions from waste incineration without energy recovery are to be reported in the waste sector. Emissions from incineration with energy recovery are to be reported in the energy sector, as other fuels (see IPCC good practice guidance, page 5.23).

Documentation box:
• Parties should provide detailed explanations on the waste sector in Chapter 8: Waste (CRF sector 6) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and/or further details are needed to understand the content of this table.
• Parties that use country-specific models should provide a reference in the documentation box to the relevant section in the NIR where these models are described, and fill in only the relevant cells of tables 6.A and 6.C.
• Provide a reference to the relevant section in the NIR, in particular with regard to:
(a) A population size (total or urban population) used in the calculations and the rationale for doing so;
(b) The composition of landfilled waste;
(c) In relation to the amount of incinerated wastes, specify whether the reported data relate to wet or dry matter.

TABLE 6.B SECTORAL BACKGROUND DATA FOR WASTE
Waste Water Handling
(Sheet 1 of 1)

SUMMARY 1.A SUMMARY REPORT FOR NATIONAL GREENHOUSE GAS INVENTORIES (IPCC TABLE 7A) (Sheet 3 of 3)

Country
Year
Submission

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	CO_2 emissions	CO_2 removals	CH_4	N_2O	HFCs		PFCs		SF_6		NO_x	CO	NMVOC	SO_2
					P	A	P	A	P	A				
	(Gg)				CO_2 equivalent (Gg)						(Gg)			
Memo Items: [(8)]														
International Bunkers														
Aviation														
Marine														
Multilateral Operations														
CO_2 Emissions from Biomass														

[(1)] The emissions of HFCs and PFCs are to be expressed as CO_2 equivalent emissions. Data on disaggregated emissions of HFCs and PFCs are to be provided in Table 2(II) of this common reporting format.

[(2)] For verification purposes, countries are asked to report the results of their calculations using the Reference approach and to explain any differences with the Sectoral approach in the documentation box to Table 1.A.(c). For estimating national total emissions, the results from the Sectoral approach should be used, where possible.

[(3)] Other Production includes Pulp and Paper and Food and Drink Production.

[(4)] According to the IPCC Guidelines (Volume 3. Reference Manual, pp. 4.2, 4.87), CO_2 emissions from agricultural soils are to be included under Land-use change and forestry (LUCF). At the same time, the Summary Report 7A (Volume 1. Reporting Instructions, Tables.27) allows for reporting CO_2 emissions or removals from agricultural soils either in the Agriculture sector, under 4.D Agricultural soils or in the Land-use change and forestry sector under 5.D Emissions and removals from soil. Parties may choose either way to report emissions or removals from this source in the common reporting format, but the way they have chosen to report should be clearly indicated, by providing a brief explanation in the documentation box to Table 4.D of the agriculture sector. Double-counting of these emissions or removals should be avoided. Parties should include these emissions or removals consistently in Table8(a) (Recalculation - Recalculated data) and Table10 (Emission trends).

[(5)] Do not provide an estimate of both CO_2 emissions and CO_2 removals. "Net" emissions (emissions - removals) of CO_2 should be estimated and a single number placed in either the CO_2 emissions or CO_2 removals column, as appropriate. Note that for the purposes of reporting, the signs for removals are always (-) and for emissions (+).

[(6)] Note that CO_2 from source categories Solid waste disposal on land and Waste incineration should only be included if it stems from non-biogenic or inorganic waste streams. Note that only emissions from waste incineration without energy recovery are to be reported in the waste sector, whereas emissions from incineration with energy recovery are to be reported in the energy sector.

[(7)] If reporting any country-specific source category under sector "7. Other", detailed explanations should be provided in Chapter 9: Other (CRF sector 7) of the NIR.

[(8)] Countries are asked to report emissions from international aviation and marine bunkers and multilateral operations, as well as CO_2 emissions from biomass, under Memo Items. These emissions should not be included in the national total emissions from the energy sector. Amounts of biomass used as fuel are included in the national energy consumption but the corresponding CO_2 emissions are not included in the national total as it is assumed that the biomass is produced in a sustainable manner. If the biomass is harvested at an unsustainable rate, net CO_2 emissions are accounted for as a loss of biomass stocks in the land-use change and forestry sector.

CO_2 Emissions from Biomass															

A = Actual emissions based on Tier 2 approach of the IPCC Guidelines.
P = Potential emissions based on Tier 1 approach of the IPCC Guidelines.

(1) The emissions of HFCs and PFCs are to be expressed as CO_2 equivalent emissions. Data on disaggregated emissions of HFCs and PFCs are to be provided in Table 2(II) of this common reporting format.

(2) For verification purposes, countries are asked to report the results of their calculations using the Reference approach and to explain any differences with the Sectoral approach in the documentation box to Table 1.A.(c).
For estimating national total emissions, the result from the Sectoral approach should be used, where possible.

(3) According to the IPCC Guidelines (Volume 3. Reference Manual, pp. 4.2, 4.87), CO_2 emissions from agricultural soils are to be included under Land-use change and forestry (LUCF). At the same time, the Summary Report 7A (Volume 1. Reporting Instructions, Tables.27) allows for reporting CO_2 emissions or removals from agricultural soils either in the Agriculture sector, under 4.D Agricultural soils or in the Land-use change and forestry sector under 5.D Emissions and removals from soil. Parties may choose either way to report emissions or removals from this source in the common reporting format, but the way they have chosen to report should be clearly indicated, by providing a brief explanation in the documentation box to Table 4.D of the agriculture sector. Double-counting of these emissions or removals should be avoided. Parties should include these emissions or removals consistently in Table8(a) (Recalculation - Recalculated data) and Table10 (Emission trends).

(4) Do not provide an estimate of both CO_2 emissions and CO_2 removals. "Net" emissions (emissions - removals) of CO_2 should be estimated and a single number placed in either the CO_2 emissions or CO_2 removals column, as appropriate. Note that for the purposes of reporting, the signs for removals are always (-) and for emissions (+).

(5) Countries are asked to report emissions from international aviation and marine bunkers and multilateral operations, as well as CO_2 emissions from biomass, under Memo Items. These emissions should not be included in the national total emissions from the energy sector. Amounts of biomass used as fuel are included in the national energy consumption but the corresponding CO_2 emissions are not included in the national total as it is assumed that the biomass is produced in a sustainable manner. If the biomass is harvested at an unsustainable rate, net CO_2 emissions are accounted for as a loss of biomass stocks in the land-use change and forestry sector.

SUMMARY 2 SUMMARY REPORT FOR CO_2 EQUIVALENT EMISSIONS
(Sheet 1 of 1)

Country
Year
Submission

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	CO_2 [1]	CH_4	N_2O	HFCs [2]	PFCs [2]	SF_6 [2]	Total
	CO_2 equivalent (Gg)						
Total (Net Emissions) [1]							
1. Energy							
A. Fuel Combustion (Sectoral Approach)							
1. Energy Industries							
2. Manufacturing Industries and Construction							
3. Transport							
4. Other Sectors							
5. Other

7. Other *(as specified in Summary 1.A)*							

Memo Items: [4]							
International Bunkers							
Aviation							
Marine							
Multilateral Operations							
CO_2 Emissions from Biomass							

(1) For CO_2 emissions from Land-Use Change and Forestry the net emissions are to be reported. Note that for the purposes of reporting, the signs for removals are always (-) and for emissions (+).

(2) Actual emissions should be included in the national totals. If no actual emissions were reported, potential emissions should be included.

(3) See footnote 4 to table Summary 1.A.

(4) See footnote 8 to table Summary 1.A.

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	CO_2 emissions	CO_2 removals	Net CO_2 emissions / removals	CH_4	N_2O	Total emissions
Land-Use Change and Forestry	CO_2 equivalent (Gg)					
A. Changes in Forest and Other Woody Biomass Stocks						
B. Forest and Grassland Conversion						
C. Abandonment of Managed Lands						
D. CO_2 Emissions and Removals from Soil						
E. Other						
Total CO_2 Equivalent Emissions from Land-Use Change and Forestry						

Total CO_2 Equivalent Emissions without Land-Use Change and Forestry [a]	
Total CO_2 Equivalent Emissions with Land-Use Change and Forestry [a]	

(a) The information in these rows is requested to facilitate comparison of data, because Parties differ in the way they report emissions and removals from Land-Use Change and Forestry. Note that these totals will differ from the totals reported in Table 10, sheet 5 if Parties report non-CO_2 emissions from LUCF.

SUMMARY 3 SUMMARY REPORT FOR METHODS AND EMISSION FACTORS USED
(Sheet 1 of 2)

Country
Year
Submission

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	CO_2 Method applied	CO_2 Emission factor	CH_4 Method applied	CH_4 Emission factor	N_2O Method applied	N_2O Emission factor	HFCs Method applied	HFCs Emission factor	PFCs Method applied	PFCs Emission factor	SF_6 Method applied	SF_6 Emission factor
1. Energy												
A. Fuel Combustion												
1. Energy Industries												
2. Manufacturing Industries and Construction												
3. Transport												
4. Other Sectors												
5. Other												
B. Fugitive Emissions from Fuels												
1. Solid Fuels												
2. Oil and Natural Gas												
2. Industrial Processes												
A. Mineral Products												
B. Chemical Industry												
C. Metal Production												
D. Other Production												
E. Production of Halocarbons and SF_6												
F. Consumption of Halocarbons and SF_6												
G. Other												

Use the following notation keys to specify the method applied:

D (IPCC default), **T1a, T1b, T1c** (IPCC Tier 1a, Tier 1b and Tier 1c, respectively), **CR** (CORINAIR),
RA (Reference Approach), **T2** (IPCC Tier 2), **CS** (Country Specific).
T1 (IPCC Tier 1), **T3** (IPCC Tier 3), **OTH** (Other)

If using more than one method within one source category, list all the relevant methods. Explanations regarding country-specific methods, other methods or any modifications to the default IPCC methods, as well as information regarding the use of different methods per source category where more than one method is indicated, should be provided in the documentation box. Also use the documentation box to explain the use of notation OTH.

Use the following notation keys to specify the emission factor used:

D (IPCC default), **CS** (Country Specific),
CR (CORINAIR), **PS** (Plant Specific).
OTH (Other)

Where a mix of emission factors has been used, list all the methods in the relevant cells and give further explanations in the documentation box. Also use the documentation box to explain the use of notation OTH.

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	CO_2 Method applied	CO_2 Emission factor	CH_4 Method applied	CH_4 Emission factor	N_2O Method applied	N_2O Emission factor	HFCs Method applied	HFCs Emission factor	PFCs Method applied	PFCs Emission factor	SF_6 Method applied	SF_6 Emission factor
3. Solvent and Other Product Use												
4. Agriculture												
A. Enteric Fermentation												
B. Manure Management												
C. Rice Cultivation												
D. Agricultural Soils												
E. Prescribed Burning of Savannas												
F. Field Burning of Agricultural Residues												
G. Other												
5. Land-Use Change and Forestry												
A. Changes in Forest and Other Woody Biomass Stocks												
B. Forest and Grassland Conversion												
C. Abandonment of Managed Lands												
D. CO_2 Emissions and Removals from Soil												
E. Other												
6. Waste												
A. Solid Waste Disposal on Land												
B. Waste-water Handling												
C. Waste Incineration												
D. Other												
7. Other (as specified in Summary 1.A)												

Use the following notation keys to specify the method applied:

D (IPCC default), **T1a, T1b, T1c** (IPCC Tier 1a, Tier 1b and Tier 1c, respectively), **CR** (CORINAIR),
RA (Reference Approach), **T2** (IPCC Tier 2), **CS** (Country Specific).
T1 (IPCC Tier 1), **T3** (IPCC Tier 3), **OTH** (Other)

If using more than one method within one source category, list all the relevant methods. Explanations regarding country-specific methods, other methods or any modifications to the default IPCC methods, as well as information regarding the use of different methods per source category where more than one method is indicated, should be provided in the documentation box. Also use the documentation box to explain the use of notation OTH.

Use the following notation keys to specify the emission factor used:

D (IPCC default), **CS** (Country Specific),
CR (CORINAIR), **PS** (Plant Specific).
OTH (Other)

Where a mix of emission factors has been used, list all the methods in the relevant cells and give further explanations in the documentation box. Also use the documentation box to explain the use of notation OTH.

Documentation box:
• Parties should provide the full information on methodological issues, such as methods and emission factors used, in the relevant sections of Chapters 3 to 9 (see section 2.2 of each of Chapters 3 - 9) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and further details are needed to understand the content of this table.
• Where a mix of methods/emission factors has been used within one source category, use this documentation box to specify those methods/emission factors for the various sub-sources where they have been applied.
• Where the notation OTH (Other) has been entered in this table, use this documentation box to specify those other methods/emission factors.

TABLE 7 SUMMARY OVERVIEW FOR KEY SOURCES
(Sheet 1 of 1)

Country
Year
Submission

KEY SOURCES	GAS	CRITERIA USED FOR KEY SOURCE IDENTIFICATION			COMMENTS
		L	T	Q	
Specify key sources according to the national level of disaggregation used:					
For example: *4.B Manure management*	*CH_4*	*X*			

Note: L = Level assessment; T = Trend assessment; Q = Qualitative assessment.

For estimating key sources Parties may chose the disaggregation level presented as an example in Table 7.1 of the IPCC good practice guidance (page 7.6), the level used in Summary 1A of the CRF or any other disaggregation level that the Party used to determine its key sources.

Documentation box:
Parties should provide the full information on methodologies used for identifying key sources and the quantitative results from the level and trend assessments (according to tables 7.A1 – 7.A3 of the IPCC good practice guidance) in Annex 1 to the NIR.

	CO_2 equivalent (Gg)			(%)
Total CO_2 Equivalent Emissions with Land-Use Change and Forestry [(6)]				
Total CO_2 Equivalent Emissions without Land-Use Change and Forestry [(6)]				

(1) Estimate the percentage change due to recalculation with respect to the previous submission (Percentage change = 100 x [(LS-PS)/PS], where LS = Latest submission and PS = Previous submission. All cases of recalculation of the estimate of the source/sink category should be addressed and explained in Table 8(b).

(2) Total emissions refer to total aggregate GHG emissions expressed in terms of CO_2 equivalent, excluding GHGs from the LUCF sector. The impact of the recalculation on the total emissions is calculated as follows:
impact of recalculation (%) = 100 x [(source (LS) - source (PS))/total emissions (LS)], where LS = Latest submission, PS = Previous submission.

(3) The relative impact of recalculations of the LUCF sector is not considered in this table, until the IPCC completes its work on good practices for this sector and methods for estimating key sources from this sector are available.

(4) According to the IPCC Guidelines (Volume 3. Reference Manual, pp. 4.2, 4.87), CO_2 emissions from agricultural soils are to be included under Land-use change and forestry (LUCF). At the same time, the Summary Report 7A (Volume 1. Reporting Instructions, Tables.27) allows for reporting CO_2 emissions or removals from agricultural soils either in the Agriculture sector, under 4.D Agricultural soils or in the Land-use change and forestry sector under 5.D Emissions and removals from soil. Parties may choose either way to report emissions or removals from this source in the common reporting format, but the way they have chosen to report should be clearly indicated, by providing a brief explanation in the documentation boxes to Table 4D of the agriculture sector. Double-counting of these emissions or removals should be avoided. Parties should include these emissions or removals consistently in Table8(a) (Recalculation - Recalculated data) and Table10 (Emission trends).

(5) Net CO_2 emissions/removals to be reported.

(6) The information in these rows is requested to facilitate comparison of data, because Parties differ in the way they report emissions and removals from Land-Use Change and Forestry.

Documentation box:
Parties should provide detailed information on recalculations in Chapter 10: Recalculations and improvements, and in the relevant sections of Chapters 3 to 9 (see section 2.5 of each of Chapters 3 - 9) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and further details are needed to understand the content of this table.

TABLE 8(b) RECALCULATION - EXPLANATORY INFORMATION
(Sheet 1 of 1)

Country
Year
Submission

Specify the sector and source/sink category[1] where changes in estimates have occurred:		GHG	RECALCULATION DUE TO				
			CHANGES IN:			Addition/removal/ reallocation of source/sink categories	Other changes in data (e.g. statistical or editorial changes, correction of errors)
			Methods [2]	Emission factors [2]	Activity data [2]		

[1] Enter the identification code of the source/sink category (e.g. 1.B.1) in the first column and the name of the category (e.g. Fugitive Emissions from Solid Fuels) in the second column of the table. Note that the source categories entered in this table should match those used in Table 8(a).

[2] Explain changes in methods, emission factors and activity data that have resulted in recalculation of the estimate of the source/sink as indicated in Table 8(a). Include changes in the assumptions and coefficients in the "Methods" column.

Documentation box:
Parties should provide the full information on recalculations in Chapter 10: Recalculations and improvements, and in the relevant sections of Chapters 3 to 9 (see section 2.5 of each of chapters 3 - 9) of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and further details are needed to understand the content of this table. References should particularly point to the sections of the NIR in which justifications of the changes as to improvements in the accuracy, completeness and consistency of the inventory are reported.

TABLE 9(a) COMPLETENESS - INFORMATION ON NOTATION KEYS
(Sheet 1 of 1)

Country
Year
Submission

Sources and sinks not estimated (NE)[1]			
GHG	**Sector[2]**	**Source/sink category [2]**	**Explanation**
CO_2			
CH_4			
N_2O			
HFCs			
PFCs			
SF_6			

Sources and sinks reported elsewhere (IE)[3]				
GHG	**Source/sink category**	**Allocation as per IPCC Guidelines**	**Allocation used by the Party**	**Explanation**
CO_2				
CH_4				
N_2O				
HFCs				
PFCs				
SF_6				

(1) Clearly indicate sources and sinks which are considered in the IPCC Guidelines but are not considered in the submitted inventory. Explain the reason for excluding these sources and sinks, in order to avoid arbitrary interpretations. An entry should be made for each source/sink category for which the notation key NE (not estimated) is entered in the sectoral tables.

(2) Indicate omitted source/sink following the IPCC source/sink category structure (e.g. sector: Waste, source category: Waste-water Handling).

(3) Clearly indicate sources and sinks in the submitted inventory that are allocated to a sector other than that indicated by the IPCC Guidelines. Show the sector indicated in the IPCC Guidelines and the sector to which the source or sink is allocated in the submitted inventory. Explain the reason for reporting these sources and sinks in a different sector. An entry should be made for each source/sink for which the notation key IE (included elsewhere) is used in the sectoral tables.

TABLE 9(b) COMPLETENESS - INFORMATION ON ADDITIONAL GREENHOUSE GASES (Sheet 1 of 1)

Country
Year
Submission

Additional GHG emissions reported[1]						
GHG	Source category	Emissions (Gg)	Estimated GWP value (100-year horizon)	Emissions CO_2 equivalent (Gg)	Reference to the source of GWP value	Explanation

(1) Parties are encouraged to provide information on emissions of greenhouse gases whose GWP values have not yet been agreed upon by the COP. Include such gases in this table if they are considered in the submitted inventory. Provide additional information on the estimation methods used.

Documentation box: Parties should provide detailed information regarding completeness of the inventory in the NIR (Chapter 1.8: General assessment of the completeness, and Annex 5). Use this documentation box to provide references to relevant sections of the NIR if any additional information and further details are needed to understand the content of this table.

4. Agriculture															
5. Land-Use Change and Forestry[(8)]															
6. Waste															
7. Other															
Total (including LUCF) [(8)]															

(1) The column "Base year" should be filled in only by those Parties with economies in transition that use a base year different from 1990 in accordance with the relevant decisions of the COP. For these Parties, this different base year is used to calculate the percentage change in the final column of this table.

(2) According to the IPCC Guidelines (Volume 3. Reference Manual, pp. 4.2, 4.87), CO_2 emissions from agricultural soils are to be included under Land-use change and forestry (LUCF). At the same time, the Summary Report 7A (Volume 1. Reporting Instructions, Tables.27) allows for reporting CO_2 emissions or removals from agricultural soils either in the Agriculture sector, under 4.D Agricultural soils or in the Land-use change and forestry sector under 5.D Emissions and removals from soil. Parties may choose either way to report emissions or removals from this source in the common reporting format, but the way they have chosen to report should be clearly indicated, by providing a brief explanation in the documentation box to Table 4.D of the agriculture sector. Double-counting of these emissions or removals should be avoided. Parties should include these emissions or removals consistently in Table8(a) (Recalculation - Recalculated data) and Table10 (Emission trends).

(3) Fill in net emissions as reported in table Summary 1.A. Please note that for the purposes of reporting, the signs for removals are always (-) and for emissions (+).

(4) The information in these rows is requested to facilitate comparison of data, because Parties differ in the way they report CO_2 emissions and removals from land-use change and forestry.

(5) Enter actual emissions estimates. If only potential emissions estimates are available, these should be reported in this table and an indication for this be provided in the documentation box. Note that only in these rows the emissions are expressed as CO_2 equivalent emissions.

(6) In accordance with the UNFCCC reporting guidelines, HFC and PFC emissions should be reported for each relevant chemical. However, if it is not possible to report values for each chemical (i.e. mixtures, confidential data, lack of disaggregation), this row could be used for reporting aggregate figures for HFCs and PFCs, respectively. Note that the unit used for this row is Gg of CO_2 equivalent and that appropriate notation keys should be entered in the cells for the individual chemicals.

(7) These totals will differ from the totals reported in table Summary 2 if Parties report non-CO_2 emissions from LUCF.

(8) Includes net CO_2, CH_4 and N_2O from LUCF.

Documentation box:
• Parties should provide detailed explanations on emissions trends in Chapter 2: Trends in greenhouse gas emissions and, as appropriate, in the corresponding Chapters 3 - 9 of the NIR. Use this documentation box to provide references to relevant sections of the NIR if any additional information and further details are needed to understand the content of this table.
• Use the documentation box to provide explanations if potential emissions are reported.

GUIDELINES FOR THE TECHNICAL REVIEW OF GREENHOUSE GAS INVENTORIES FROM PARTIES INCLUDED IN ANNEX I TO THE CONVENTION

A. Objective

1. The objective of these guidelines is to promote consistency in the review of annual greenhouse gas (GHG) inventories of Parties included in Annex I to the Convention (Annex I Parties) and to establish a process for a thorough and comprehensive technical assessment of national inventories.

B. Purposes of the technical review of greenhouse gas inventories

2. The purpose of the technical review of Annex I Parties' GHG inventories is:

(a) To ensure that the Conference of the Parties (COP) has adequate and reliable information on annual inventories and emission trends of anthropogenic emissions by sources and removals by sinks of greenhouse gases not controlled by the Montreal Protocol;

(b) To provide the COP with an objective, consistent, transparent, thorough and comprehensive technical assessment of the annual quantitative and qualitative inventory information submitted by Annex I Parties, and a technical assessment of the implementation of Annex I Parties' commitments under Article 4, paragraph 1 (a), and Article 12, paragraph 1 (a), of the Convention;

(c) To examine, in a facilitative and open manner, the reported inventory information for consistency with the "Guidelines for the preparation of national communications by Annex I Parties included in Annex I to the Convention, Part I: UNFCCC reporting guidelines on annual inventories"[1] and the *Revised 1996 (IPCC) Guidelines for National Greenhouse Gas Inventories*[2] as elaborated by the IPCC report entitled *Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories;*[3]

(d) To assist Annex I Parties in improving the quality of their GHG inventories.

C. General approach

3. Greenhouse gas inventory submissions from all Annex I Parties will be subject to an annual technical review. The technical review process for GHG inventories, as outlined in these guidelines, comprises three stages which consider different aspects of the inventories in such a way that all of the purposes described above are achieved by the end of the process. The three stages are:

(a) Initial check of annual inventories;

(b) Synthesis and assessment of annual inventories;

(c) Review of individual annual inventories.

4. The stages of the technical review process complement each other so that, in general, for each Annex I Party, one stage is concluded before the next one is undertaken.

---

1 Referred to in this document as the reporting guidelines.

2 Referred to in this document as the IPCC Guidelines.

3 Referred to in this document as the IPCC good practice guidance.

5. At all stages of the inventory review process, individual Annex I Parties under review will have the opportunity to clarify issues or provide additional information. The secretariat will send to these Annex I Parties drafts of their status report, the synthesis and assessment report and a preliminary analysis of the respective Party's inventory, and their individual inventory review report. Every effort will be made to reach agreement with each Party on the content of a report prior to its publication. In the case of a Party and the expert team being unable to agree on an issue, the Party may provide explanatory text to be included in a separate section of the report.

D. Initial check of annual inventories

1. Scope

6. The secretariat will conduct annually an initial check of the annual GHG inventory submissions from Annex I Parties in order to determine promptly whether the information provided is complete and in the correct format, and to enable subsequent review stages to take place.

7. The initial check will cover the national inventory submission, in particular, the data submitted electronically in the common reporting format (CRF), and will determine:

(a) Whether all sources, sinks and gases included in the IPCC Guidelines, as elaborated by the IPCC good practice guidance, are reported;

(b) Whether all tables of the CRF have been completed and any gaps have been explained in the CRF by use of notation keys (such as NE, NA, NO, IE, C)[4] and whether there is frequent use of these notation keys;

(c) Whether estimates for summary totals and individual source categories are provided in mass units and in terms of CO_2 equivalent using the IPCC global warming potential (GWP) values in accordance with the relevant decisions of the COP;

(d) Whether emission estimates are provided for all required years (i.e., from the base year to the latest year in the current submission);[5]

(e) Whether methodologies are indicated with notations in the CRF;

(f) Whether estimates for CO_2 emissions from fossil fuel combustion are reported using the IPCC reference approach in addition to estimates derived using national methods;

(g) Whether actual and potential emission estimates for hydrofluorocarbons, perfluorocarbons and sulphur hexafluoride are reported by individual chemical species;

(h) Whether any recalculations are reported for the entire time series and explanatory information relating to these recalculations is provided in the CRF;

(i) Whether all emissions are reported without adjustments relating, for example, to climate variations or trade of electricity;

(j) Whether emissions from fuel used in international transportation are reported separately from national totals;

---

[4] NE = not estimated, NA = not applicable, NO = not occurring, IE = included elsewhere, C = confidential.

[5] In accordance with the reporting guidelines, if there are no changes in the previously submitted inventories, the national inventory report (NIR) should reference the inventory submission where the other years constitute the time series.

(k) Whether key sources have been reported in the CRF as required by the reporting guidelines;

(l) Whether the tables on uncertainties have been reported as required by the reporting guidelines;

(m) Whether a national inventory report (NIR) has been submitted.

2. Status reports

8. The results of the initial check for each Annex I Party will be published on the UNFCCC web site as a status report, mainly in a tabular format. The status report will, inter alia:

(a) Indicate the date of receipt by the secretariat;

(b) Indicate whether the NIR and the CRF have been submitted;

(c) Determine whether the inventory information has been provided in the correct format as called for in the reporting guidelines;

(d) Determine whether the submission is complete and identify any gaps in the reported data, covering the elements listed in paragraph 7 above.

3. Timing

9. The initial check for each Annex I Party should be finalized and the status report published on the UNFCCC web site within seven weeks of the date of receipt of the submission by the secretariat. In general, the timetable for the initial check should conform to the following:

(a) The secretariat should perform the initial check and prepare a draft status report within three weeks and send it to the Party for comments;

(b) Each Party should provide comments on the draft status report within three weeks.

E. Synthesis and assessment of annual inventories

1. Scope

10. The secretariat will conduct a synthesis and assessment of Annex I Parties' greenhouse gas inventories to facilitate the consideration of inventory data and other information across Annex I Parties, and to identify issues for further consideration during the review of individual inventories.

11. The synthesis and assessment will cover the national inventory submission and previous national inventory submissions, where relevant, and will include a standardized set of data comparisons of:

(a) Implied emission factors and other inventory data across Annex I Parties to identify any irregularities or inconsistencies;

(b) Emission or removal estimates, activity data, implied emission factors and any recalculations with data from previous submissions to identify any irregularities or inconsistencies;

(c) Activity data of each Annex I Party with relevant authoritative sources, if feasible, to identify cases where there are significant differences.

12. To facilitate the analysis of the inventory data, the secretariat will, for each individual Annex I Party, identify and consider those sources that are *key sources* both in terms of their absolute

level and in terms of their trend assessment, applying the tier 1 level assessment as described in the IPCC good practice guidance. In addition, the secretariat will consider other sources (i.e., emissions from bunker fuels, emissions and removals from land-use change and forestry,[6] etc.) and non-key sources for which irregularities or inconsistencies are identified, based on their significance for specific sectors or for the whole GHG inventory.

2. Synthesis and assessment report

13. The synthesis and assessment will consist of two parts: part I and part II, which are described in paragraphs 14 and 15 below, respectively. The results of part I will be published on the UNFCCC web site as a synthesis and assessment report. Part II, containing a preliminary analysis of individual Annex I Party inventories, will be sent to the respective Party for comments. The results of part II, together with the comments provided by the respective Party, will be provided to the corresponding expert review team as input for the individual review.

Part I

14. The synthesis and assessment report (part I) will provide information to allow comparisons across Annex I Parties and to describe common methodological issues. This report will compile and compare information across Annex I Parties in a tabular and, as appropriate, graphical format, including:

(a) For *key sources*, based on the approach used by the secretariat, and other selected sources:

(i) Methodologies used in the preparation of the inventories;

(ii) Implied emission factors, default values and ranges contained in the IPCC Guidelines, as elaborated by the IPCC good practice guidance;

(iii) Reported activity data and data from authoritative sources, if possible;

(iv) Other information provided in the various CRF tables;

(b) Estimates of CO_2 emissions from fuel combustion using the IPCC reference approach compared with estimates of CO_2 emissions from fuel combustion using a national (sectoral) approach;

(c) Estimates of actual and potential emissions of hydrofluorocarbons, perfluorocarbons and sulphur hexafluoride and the ratio between the actual and potential emissions;

(d) Inventory recalculations.

Part II

15. The preliminary analysis of individual Annex I Party inventories (part II), will be based on the information contained in the synthesis and assessment report, and will, for each individual inventory:

(a) Identify issues within source or sink categories requiring further consideration or clarification during the individual review stage;

(b) Identify any recurring problems with reporting;

(c) Examine inventory recalculations and the consistency of the time series;

---

6 For land-use change and forestry, good practice guidance has not, as yet, been elaborated.

(d) Assess the availability of documentation on:

(i) National self-verification procedures or independent review in the technical review process;

(ii) The application of the IPCC good practice guidance, including estimations of uncertainties;

(e) Assess the consistency of information on methodologies and emission factors in the CRF with related information in the NIR.

3. Timing

16. The synthesis and assessment will be conducted annually and should, in general, conform to the following timetable:

(a) The secretariat will complete the synthesis and assessment report (part I), containing the elements in paragraph 14 above, within 10 weeks from the due date for submission.[7] The secretariat will incorporate all submissions and any re-submissions from Annex I Parties that were provided as a response to the status report and were received within six weeks from the due date for submissions. Annex I Parties should provide comments within three weeks of receipt of the draft synthesis and assessment report. If possible, the secretariat should complete a synthesis and assessment of the GHG inventories submitted after that date and should publish these assessments as separate documents (addenda to the synthesis and assessment report) provided that this does not delay the review process for other Annex I Parties;

(b) The preliminary analysis of individual Annex I Party inventories (part II of the synthesis and assessment), containing the elements in paragraph 15 above, will be completed at the latest four weeks prior to the scheduled individual review for the Party concerned. The secretariat will send a draft of the preliminary analysis to the Party at the latest seven weeks prior to the scheduled individual review, and the Party will provide comments within three weeks. The preliminary analysis and the Party's comments will be forwarded to the expert review team for further consideration.

F. Review of individual annual inventories

1. Scope

17. Expert review teams, coordinated by the secretariat, will conduct reviews of individual greenhouse gas inventories in order to assess whether the COP has adequate and reliable information on annual GHG inventories. The individual reviews will provide for a detailed examination of the inventory estimates, procedures and methodologies used in the preparation of inventories, covering each Annex I Party's national inventory submission, supplementary material submitted by the Party and, as appropriate, previous inventory submissions. The results of this stage of the review process will be communicated to Annex I Parties.

18. Three operational approaches may be used during this stage of the technical review, namely desk reviews, centralized reviews and in-country reviews, assuming available resources. During a desk review, inventory information of Annex I Parties will be sent to experts, who will conduct the review in their own countries. During a centralized review, the experts will meet in a single location to review the

[7] In accordance with decision 3/CP.5, the due date for submission of the GHG inventories of Annex I Parties is 15 April of each year.

inventory information of Annex I Parties. During an in-country review, experts will visit an Annex I Party to review the inventory information of this Party.

19. The review of most individual inventories of Annex I Parties will be conducted annually as a desk review or as a centralized review. In addition, the GHG inventory of each Annex I Party will be subject to an in-country visit by an expert review team once every five years. In a year when an in-country review is scheduled, a desk or centralized review of the Party's GHG inventory will not take place. In-country visits will be scheduled, planned and take place with the consent of, and close coordination with, the Party subject to review. In general, during a centralized review, up to eight GHG inventories should be reviewed; during a desk review up to five GHG inventories should be reviewed.

20. Expert review teams should pay particular attention to those areas of the inventory where problems have been identified in previous reviews, or stages of the review, or where changes have been reported by the Party. Expert review teams should not perform an individual review in cases where a NIR has not been provided.

21. Each expert review team will:

(a) Examine application of the requirements of the reporting guidelines, and the IPCC Guidelines as elaborated by the IPCC good practice guidance, and identify any departure from these requirements;

(b) Examine whether the IPCC good practice guidance was applied and documented, in particular noting the identification of key source categories, selection and use of methodologies and assumptions, development and selection of emission factors, collection and selection of activity data, reporting of recalculations and consistent time-series, reporting of uncertainties related to inventory estimates, methodologies used for estimating those uncertainties and quality assurance and quality control procedures, and identify any inconsistencies;

(c) Compare emission or removal estimates, activity data, implied emission factors and any recalculations with data from previous submissions of the Annex I Party to identify any irregularities or inconsistencies;

(d) Identify any missing sources and examine any explanatory information relating to their exclusion from the GHG inventory;

(e) Identify the reason for any differences between the Party's and the secretariat's key source determination;

(f) Assess the consistency of information in the CRF with that in the NIR;

(g) Assess the extent to which issues raised in the synthesis and assessment of annual inventories, and issues and questions raised by expert review teams in previous reports, have been addressed and resolved;

(h) Identify areas for further improvement of the inventories and note possible ways for improving the estimation and the reporting of inventory information.

22. In addition to the tasks mentioned in paragraph 21 above, expert review teams conducting in-country reviews will consider the "paper trail" of the inventory from the collection of data to the reported emission estimates and will examine procedures and institutional arrangements for inventory development and management, including quality assurance and quality control, record-keeping and documentation procedures. During subsequent desk or centralized reviews, the expert review teams will

identify any changes that may have occurred in these procedures and institutional arrangements, based on the information provided in the NIRs of Annex I Parties.

23. The expert review team may use relevant technical information in the review process, such as information from international organizations.

2. Expert review teams

General procedures

24. Each GHG inventory submission will be assigned to a single expert review team that will be responsible for performing the review in accordance with the procedures and time frames established in these guidelines. A submission by an Annex I Party will not be reviewed in two successive years by expert review teams with an identical composition.

25. Each expert review team will provide a thorough and comprehensive technical assessment of the GHG information submitted and will, under its collective responsibility, prepare a review report in accordance with the provisions of these guidelines.

26. Expert review teams will be coordinated by the secretariat which will provide administrative support, and, as appropriate, technical and methodological assistance and assistance in the use of the reporting guidelines, and these review guidelines.

27. Expert review teams will be composed of experts selected on an ad hoc basis from the UNFCCC roster of experts and will include lead reviewers. Experts will be nominated by Parties to the Convention to the roster of experts and, as appropriate, by intergovernmental organizations, in accordance with guidance provided for this purpose by the COP. Participating experts will serve in their personal capacity and will neither be nationals of the Party under review nor be nominated or funded by that Party.

28. In the conduct of the review, expert review teams shall adhere to these guidelines and work on the basis of established and published procedures, including quality assurance and control and confidentiality provisions in accordance with the relevant decisions adopted by the COP.

29. The secretariat will notify Annex I Parties about up-coming desk and centralized reviews, and ask the Annex I Parties to identify the contact person(s) through whom enquiries could be directed. Communication between the expert review teams and the Party under review should be through the lead reviewers and the designated contact person(s) of the Party. Other members of the expert review team may communicate directly with the national experts involved in the GHG inventory preparation only if a Party so agrees. Information thus obtained should be made available to other members of the team.

30. Participating experts from Parties not included in Annex I to the Convention (non-Annex I Parties) and Annex I Parties with economies in transition will be funded according to the existing procedures for participation in UNFCCC activities. Experts from other Annex I Parties will be funded by their governments.

Composition of the expert review teams

31. Participating experts shall have experience in the area of GHG inventories in general and/or in specific sectors (Energy, Industrial Processes, Solvents and Other Products Use, Agriculture, Land-Use Change and Forestry, and Waste).

32. Expert review teams may vary in size and composition, taking into account the national circumstances of the Party under review and the different expertise needs.

In general, the normal size of the expert review teams should be:

(a) Six experts for in-country visits (one expert per inventory sector[8] plus one generalist[9]);

(b) Twelve experts for desk and centralized reviews (two experts per inventory sector[8] plus two generalists[9]).

33. The secretariat will select the members of the review teams in a way that will ensure that the collective skills of the team address the areas mentioned in paragraph 31 above and that most experts in the teams have the necessary experience in the review process. The secretariat will select national inventory experts with limited or no experience of the review process and invite one of these experts to participate in each in-country review, with a maximum of five experts to participate in each centralized review. These experts with limited or no experience of the review process will work on a specific IPCC sector together with an expert with experience of the review process. Desk reviews will be conducted only by experienced experts.

34. The secretariat will select the members of the expert review teams with a view to achieving a balance between experts from Annex I Parties and non-Annex I Parties in the overall composition of the expert review teams, without compromising the selection criteria referred to in paragraph 31 above. The secretariat shall make every effort to ensure geographical balance among those experts selected from non-Annex I Parties and among those experts selected from Annex I Parties.

35. Without compromising the criteria stated in paragraphs 31 to 34 above, the formation of expert review teams should ensure, to the extent possible, that at least one member is fluent in the language of the Party under review.

Lead reviewers

36. For each expert review team, two inventory experts with substantial inventory review experience will serve as lead reviewers. One lead reviewer will be from a non-Annex I Party and one from an Annex I Party.

37. Lead reviewers should ensure that the review in which they participate is performed according to these guidelines and is performed consistently across all Annex I Parties under review by the expert review team. They should also ensure the quality and the objectivity of the technical assessments in the reviews.

38. With the support of the secretariat, lead reviewers will:

(a) Prepare a brief work plan for the review activity;

(b) Verify that the experts have all the necessary information provided by the secretariat prior to the review activity;

(c) Monitor the progress of the review activity;

(d) Ensure that there is good communication within the expert review team;

(e) Coordinate queries of the expert review team to the Party and coordinate the inclusion of the answers in the review reports;

---

8 The expert(s) dealing with the Industrial Processes sector should also be responsible for the Solvents and Other Products Use sector which, in general, does not constitute a major source of GHG emissions.

9 The term “generalist” in these guidelines is used for experts who have broad knowledge of all areas of the inventory process.

(f) Provide technical advice to the ad hoc experts, if needed;

(g) Ensure that the review is performed and the review report is prepared in accordance with these guidelines;

(h) Verify that the review team gives priority to individual source categories for review in accordance with these guidelines.

3. Individual review reports

39. Under its collective responsibility, the expert review team will produce an individual inventory review report for publication in electronic format on the UNFCCC web site based on the results of the tasks listed in paragraph 21 above. The review reports should contain an objective assessment of the adherence of the inventory information to the reporting guidelines and the provisions of relevant decisions by the COP and should not contain any political judgement.

40. The report of all in-country reviews should not exceed 25–30 pages including a 2–3 page summary. For desk and centralized reviews, the report should not exceed 10 pages and should focus on particular strengths and identified problems as well as on an overall appraisal of the quality and reliability of the inventory, emission trends, actual emission factors and activity data, and on the degree of adherence to the reporting guidelines and the IPCC good practice guidance. Both types of review reports should include standardized tables, whenever possible, to increase the efficiency of communication.

4. Timing

41. The secretariat should forward all relevant information to the members of the expert review teams one month prior to the start of the review activities. Each desk or centralized review should be completed within 20 weeks and 25 weeks,[10] respectively, and each in-country review should be completed within 14 weeks. In general, the timetable for the individual review activities, assuming available resources, should conform to the following:

(a) *Desk review*: each expert review team performs individual reviews and prepares draft review reports within seven weeks (three weeks for individual reviews and four weeks for the preparation of the reports). The secretariat edits and formats the reports and sends them to the respective Annex I Party for comments. The Annex I Parties respond within four weeks. The expert review team integrates the Annex I Parties' comments within four weeks and sends the revised versions of the reports to the secretariat. The final reports are published on the UNFCCC web site within two weeks.

(b) *Centralized review*: each expert review team performs individual reviews and prepares draft review reports within ten weeks (up to eight working days for individual reviews and nine weeks for the preparation of the reports). The secretariat edits and formats the reports and sends them to the respective Annex I Party for comments. The Annex I Parties respond within four weeks. The expert review team integrates the Annex I Parties' comments within six weeks and sends the revised versions of the reports to the secretariat. The final reports are published on the UNFCCC web site within two weeks.

---

[10] According to the original version of these guidelines (see FCCC/SBSTA/2002/L.5/Add.2), a total of 22 weeks was allocated for the completion of a centralized review. However, this period does not include the necessary time for editing and formatting of the review reports by the secretariat as required in paragraph 41(b). Therefore, the total time available for review has been increased from 22 to 25 weeks to be consistent with the approach taken for desk and in-country reviews.

(c) *In-country review*: each expert review team performs the individual review within one week and prepares a draft review report within three weeks. The secretariat edits and formats the report and sends it to the respective Annex I Party for comments. The Party responds within four weeks. The expert review team integrates the Party's comments within three weeks and sends the revised version of the report to the secretariat. The final report is published on the UNFCCC web site within one week.

G. Annual report of emissions and trends of greenhouse gases

42. As part of the technical review of annual national GHG inventories, the secretariat will also compile and tabulate aggregate information and trends concerning greenhouse gas emissions by sources and removals by sinks, and any other inventory information, in a stand-alone document to be published electronically on the UNFCCC web site. This document will draw information from the latest available GHG inventory submissions of all Annex I Parties and will serve to provide aggregate information to the COP on GHG emissions by sources and removals by sinks and their trends for all Annex I Parties. This document may also be used as an input to the third stage of the technical review process.

43. A summary of the document mentioned in paragraph 42 above will be published in both hard copy and electronic format for the consideration of the COP and the subsidiary bodies.[11] This summary will include trends of GHG emissions by sources and removals by sinks and an assessment of the adherence of the reported inventory information to the reporting guidelines, as well as to the provisions of relevant decisions by the COP, including information on any delays in submitting the annual inventory information.

- - - - -

[11] In order to ensure the quality and timeliness of the information included in this summary, the secretariat will prepare this report for the consideration of the Convention bodies during the second sessional period scheduled for each year.

Stakeholder Meeting for the implementation of

UNEP' GLOBAL TECHNICAL ASSISTANCE PROGRAMME IN THE CHILLER SUB-SECTOR

CONCEPT NOTE

29 October 2006

BACKGROUND

The 48th meeting of the Executive Committee of the Multilateral Fund approved a Global Technical Assistance Programme in the Chiller Sub-Sector to be implemented by UNEP. The project complies with decision XVI/13 and in particular with regard to the countries which didn't receive a chillers demonstration project or any support in the chillers sector from the Multilateral Fund. Through UNEP's Compliance Assistance Programme, this project aims at providing global technical assistance to Article 5 countries in the chillers sub-sector to enable the countries to gain better understanding of the available financial and technological options in the chillers sub-sector to phase-out ODS through a close coordination with other Implementing and Bilateral Agencies working on investment projects in the chillers sector, other relevant stakeholders at the global and regional level as well as the regional teams of the Compliance Assistance Programme.

The 47th & 48th meetings of the Executive Committee approved several chillers demonstration projects within the funding window opened as per decision 45/4 covering countries in Latin America, Africa, East Europe, West Asia and South Asia & Pacific regions. Historically there were also previous approvals –under the Multilateral Fund- for chillers demonstration projects and activities (replacement & retrofitting); additionally many developed countries and some developing countries adopted national programs for phasing out the CFC-based chillers. On the other hand, most of international manufacturers developed and promoted non-CFC technologies during the last two decades. The TEAP special report on Chillers –that issued in 2004- provide a comprehensive snapshot on the technology trend as well as available information on remaining CFC-based chillers around the world. International/regional/national associations and societies are also contributing to the phase out actions through research activities, functions and thematic initiatives.

UNEP recognizes the importance of compiling all past, ongoing and future efforts in this movement and present relevant information in a useful way to the targeted stakeholders i.e. owners, policy makers, consultants and others influential parties to the chillers sector. UNEP also understands the values of coordination and appropriate planning for the sake of best results and saving of resources. Therefore, UNEP will organize a stakeholder meeting to discuss the implementation of the Global Technical Assistance Programme in the Chiller Sub-Sector.

TARGETED PARTICIPANTS

Participants to the stakeholder meeting will be representing the key partners and source of information for the implementation of the Global Technical Assistance Programme in the Chiller Sub-Sector, the proposed list includes:

- Bilateral & Implementing Agencies (Canada, Germany, France, Japan, USA, UNDP, UNIDO & World Bank);
- TEAP Chiller Task Force;
- Industry Representatives (Carrier, Trane, York, Daikin and others);
- Relevant International Associations/Organizations (ARI, ASHRAE, ICARMA, IIR) &
- Financial institutions

This meeting is being coordinated by UNEP's Compliance Assistance Programme Team (CAP) in cooperation with United States Environmental Protection Agency (US EPA).

OBJECTIVES

The stakeholder meeting will have the following objectives:

1. Discuss the project implementation approach and activities and compile feedback/proposals of participants and views on cooperation during the implementation timeframe.
2. Review the implementation time schedule of UNEP project with other Bilateral and Implementing agencies schedules in executing the demonstration projects to ensure that outputs of these projects are well reflected in the products developed by UNEP project.
3. Identify sources of information that could be used during the compilation phase of the project and means of verifying collected data.
4. Discuss the potential role of manufacturers and associations in compilation and dissemination of information during the various stages of the project.

DISCUSSION TOPICS

The topics proposed for discussions in the stakeholder meeting are:

- Detailed explanation of the project content and UNEP' view of implementation
- Plans and schedules for the chiller demonstration projects implemented by Bilateral and Implementing agencies
- Manufacturers views and experiences (focus on replacement/retrofit experience)
- Associations activities in the chiller sector
- Adequacy of the proposed activities and products in addressing countries' needs
- Role of Industry and international associations in information compilation and dissemination
- Proposed coordination plan inline with to the implementation time schedule
- Other topics (to be suggested by participants of the meeting)

DATE & VENUE

29 October 2006 from 9.00 a.m. to 5 p.m. at India Habitat Centre, New Delhi.

Chiller Replacement Projects

Presentation by World Bank
Global Chiller Workshop
29 October 2006
New Delhi, India

Objectives

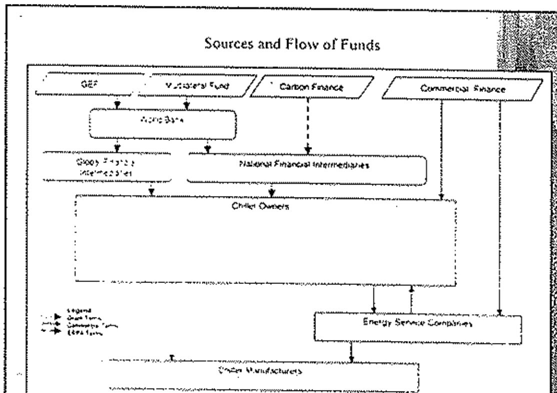
- Provide an overall strategy for all participating countries for phasing out CFCs in the chiller sector; and
- Promote utilization of more energy efficient chillers.

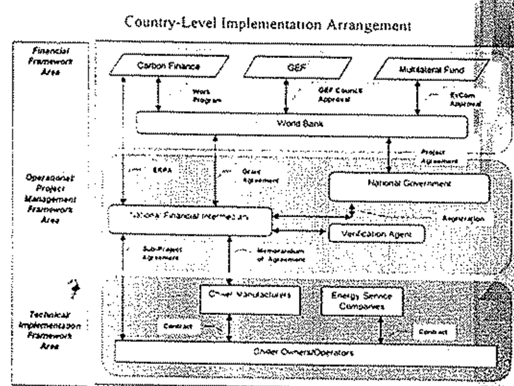
Expected Outputs

- Fulfillment of Protocol-mandated phase-out of CFC consumption;
- Accelerated transformation of the chiller sector market to one more technology-driven and responsive to energy saving opportunities;
- Free up power capacity of up to 416 MW;
- Reduce carbon dioxide emissions by up to 5.3 million MT per year for the next 17 years.

Project Description

- Deliver incentives to CFC chiller owners sufficient to overcome the well-documented techno-economic barriers;
- Stimulate the adoption by participating countries of policy and regulatory measures aimed at:
  - Fulfillment of CFC phase-out obligations;
  - Bringing private behavior in respect of energy conservation more in line with desirable social behavior; and
  - Reducing or eliminating avoidable greenhouse gas emissions.

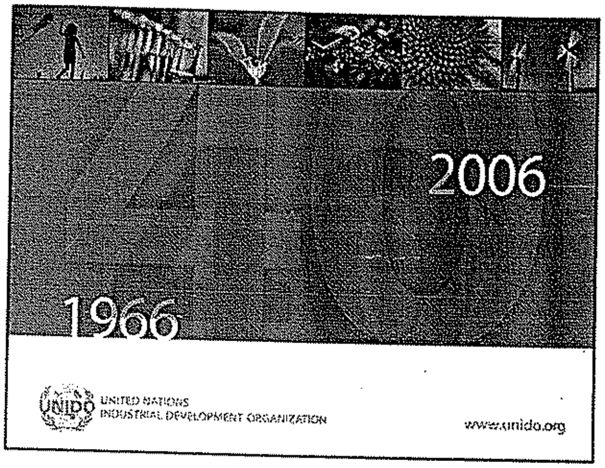




Sample Cashflow for the Overall Global Chiller Replacement Projec

Project Components

- Investment Component
  - Financial incentives to chiller owners to accelerate their chiller replacement schedules;
  - Level of incentives determined in accordance with para. (b) (ii) Decision 46/33;
- Technical Assistance Component
  - Local project implementation units (LPIU) will work with NOUs to assist chiller owners preparing decentralized refrigerant management plans;
  - Capacity building for LPIU on energy conservation and proper handling of refrigerants.
- Awareness
  - Chiller suppliers with their existing sales network will conduct, in close cooperation with LPIU and NOU, awareness activities for the targeted audience (chiller owners).



UNIDO's Chiller Programme

UNEP - USEPA Chiller meeting side event

S. M. Si Ahmed
29 October 2006, New Delhi, India

Three Regional Projects Approved

- West Asia (US$ 585,961) – Syria.
- Eastern Europe (US$ 1,069,074) - Croatia, Macedonia, Romania, and Serbia and Montenegro (Former)
- Africa (US$ 2,000,000) – Cameroon, Egypt, Namibia, Nigeria and Sudan (with possibility to include more countries in Africa)

  Under implementation by UNIDO, France, Germany and Japan

Project Activities

- Awareness Raising
- Policy advice
- Capacity Building
- Technology transfer
- Demonstration of funding approaches for replication aspects: Country based approach taking into account existing local conditions and chiller populations
- Dissemination of lessons learned

Croatia – Working through ESCOs

Role of the ESCO (Hrvatska Elektroprivreda)

- Information, advice and training on energy management issues
- Support for the implementation of energy plans
- Energy audits
- Raising awareness on energy efficiency
- Search for energy-management incentive funds at national and international level
- Financing through credit

Romania, Macedonia and Syria

Building the end users capacity in;

- evaluating the various available technology options,
- better understanding of the return on investment issue,
- preparing specifications,
- evaluating proposals,
- accessing chiller suppliers worldwide,
- available funding options

www.unido.org

Serbia

- Provision of subsidies for the replacement of a number of chillers instead of the partial cost pertaining to the replacement of one chiller.

www.unido.org

Common Limitations

- Substantial external financial resources are often required for the modification of the entire cooling plant, which creates an additional obstacle

www.unido.org

Africa

- Innovative approach to clearly evaluate and demonstrate the incentives and remove barriers for operators to replace CFC based chillers through coordinating inputs from engineering facilities and energy contracting providers, investors, financial institutions, government and private sector stakeholders in the region.

www.unido.org

Organizational and Institutional Framework

Government interventions in creating an overall framework that encourages chiller replacement

Differentiated roles ⇕ *Complementary roles*

Stakeholder involvement and willingness to respond with creativity and business generating attitude

www.unido.org

Potential External Funding Sources

- FGEF
- UNIDO's Investment and Technology Promotion Office (ITPO), Tokyo
- Japan Bank for International Cooperation
- African Development Bank
- Import / Export Banks (Afreximbank)
- Commercial Banks

www.unido.org

Main Conclusions of the Regional Workshop in Cairo

- Need to maintain momentum under the project funding conditions
- Implementing agencies were requested to take up the use of approved funds with the Multilateral Fund so that release of the funds is not conditional to any other steps at the national level
- Need to explore the CDM potential (UNIDO is currently studying the possibility of starting with a pilot country)

AFROC – AN EXAMPLE FOR CHILLER CDM FINANCING IN AFRICA

Juergen USINGER
GTZ Proklima

October - New Delhi

---

gtz

Content

1) Introduction of AFROC Project
2) Network of AFROC
3) Possibilities on Financing and Funding
4) Possibilities on CDM Financing

---

gtz

1) Introduction of the AFROC Project

Background

- Approved by the MLF: funding of a demonstration project and financing of 19 chillers in 6 African countries
- Market: ca. 600 to 1,000 chillers in the African countries
- Estimated average investment: ca. 140,000 US $ per chiller
- Incentive for significant exports of energy efficient technology system (unit and system)
- Proposed initial volume of funding: 20,000,000 US $

---

gtz

1) Introduction of the AFROC Project

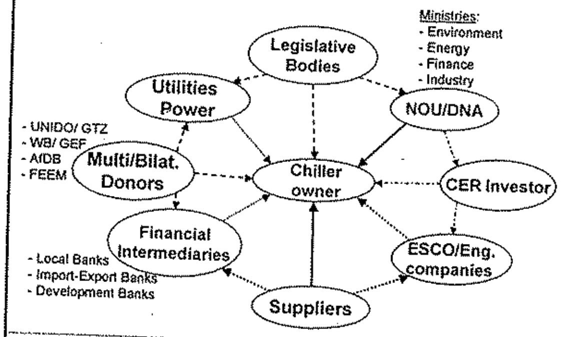
Phase I
- Demonstration of financial incentives and necessary infrastructure
- Technology acquisition for 19 chillers in 6 African countries
- Set up of a network and replacement policy
- Identify and remove barriers

Phase II
- Established mechanism from Phase I to replace all CFC Chillers in African countries which fulfil criteria of the Secretariat of the Montreal Protocol

---

gtz

2) Network of AFROC



---

gtz

3) Possibilities on Financing and Funding

Identified Barriers for chiller investments by Suppliers:

- Initial costs
- Operating costs
- Lack of awareness for new technologies
- Less knowledge on energy efficiency and environmental issues
- High customs duties

⇨ **Create conditions to remove these barriers through better access to:**

1) Capacity building / Technical assistance
2) Financial services

12

gtz

3) Possibilities on Financing and Funding

Overcome Barriers by an improved framework for investments

1) Capacity building / Technical assistance

- Establishment of national network
- Coordination of Stakeholders and Funding partners
- Support in formulation and adaptation of regulations and standards
- Identification of suitable technology

⇨ Reduction of transaction costs

gtz

3) Possibilities on Financing and Funding

Overcome Barriers by providing financial contributions

2) Interested financial institutions

- MLF: Funding of 19 chillers during Phase I
- FFEM: bilateral contribution and additional grants for TA and
- AfDB: Public and private loans, credit line; min. 3 Mio. US $
- Afreximbank: Credit lines to corporates and to local banks
- Development Bank Senegal: credit lines, guarantees
- KfW: commercial credits for energy efficiency
- CDM

gtz

4) Possibilities on CDM Financing

1) Methodology:
- Small-scale (simplified PDD, 1 barrier sufficient, <15 GWh/year)

2) Bundling:
- Max. size 15 GWh/year; will change to 60 GWh/year
- Bundle parts must have same crediting period
- No change of composition of bundle over time

- Bundle with same technologies – one monitoring plan
- Bundle with different technology – separate monitoring and reports

gtz

4) Possibilities on CDM Financing

CER sales from CDM are directly proportional to energy savings

$$\frac{\text{Gain from investment with CDM}}{\text{Gain from investment without CDM}} = \frac{\text{Emission factor x CER price}}{\text{Electricity price}}$$

Egypt: $\frac{0.525 \text{ CER / MWh x } 12 \text{ € / CER}}{0.027 \text{ € / kWh}}$ = 23 % higher NPV with CDM

Nigeria: 0.540 CER/MWh, 0.067 €/kWh = 9.6 %

Cameroon: 0.880 CER/MWh, 0.09 €/kWh = 11.7 %

Namibia: 0.890 CER/MWh, 0.019 €/kWh = 56 %

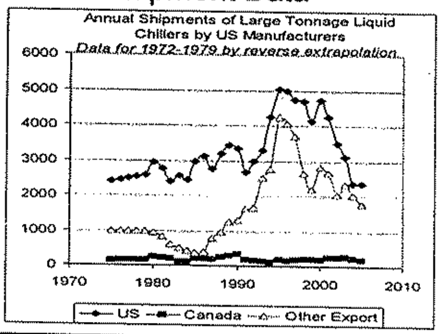
CFC Chiller Background

- CFCs were used primarily in large centrifugal chillers
- CFC chillers in operation
  - Approximately 50,000 worldwide
  - Includes approximately 37,000 in N. America (2004 ARI survey)
- CFC chiller replacement has been slow
  - High level of activity in early 1990s
  - 58% of U.S. CFC chillers have been replaced

Large Tonnage Chillers Shipment Data



CFC Refrigerant Use - Chillers

- Age of all CFC chillers in service
  - 29,000 units (approx.) ---- 10-20 years old
  - 21,000 units (approx.) ---- 20-30 years old
- Refrigerant inventory in CFC chillers
  - 24,000 MT (approx.)
- Chillers service needs
  - Recycled and reclaimed CFCs (Article 5 and non-Article 5)
  - Virgin CFCs (Article 5)

Impediments to Chiller Replacement

- Scarce capital and economic return
  - Available capital goes to replacement projects having the fastest economic return
- Useful life of existing equipment
  - Centrifugal chillers have a long service life – estimated between 20-30 years
- Confidence in CFC service supply and regulations
  - Adequate supplies of virgin/recycled/reclaimed CFCs exist
  - Regulations in most countries allow for the continued use and servicing of CFC chillers

Incentives for Chiller Replacement

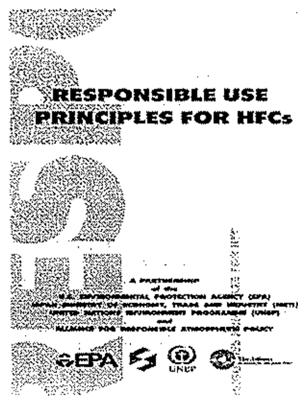
- Access to capital
  - Encourage measures to increase access to capital
    - Assistance from Multilateral Fund implementing agencies
    - Other governmental and commercial funding
- Change in current tax and incentive policies
  - Provide tax credits or accelerated depreciation
  - Institute rebate programs
- Increased awareness and leadership
  - Provide education for building owners
  - Protect the stratospheric ozone layer and the climate
  - Save energy and money; and create jobs
  - Support Montreal Protocol and Kyoto Protocol

Ozone and Climate Benefits of CFC Chiller Replacement

- New liquid centrifugal chillers use non-CFC refrigerants (lower ODP & lower GWP)
- Refrigerant emissions are negligible
  - Leak tight design – 0.5-2% annual leak rate today compared to 10-12% in 1980s
  - Venting prohibitions in many countries
  - Technician certification for equipment service and repair
- Chiller efficiencies have significantly improved -- over 30% since the 1980s
  - Indirect emissions account for 98% of a chiller's lifetime contribution to global climate change
  - Increased efficiency results in less carbon dioxide emissions from power generation

Technical and Economic Feasibility of CFC Chiller Replacement

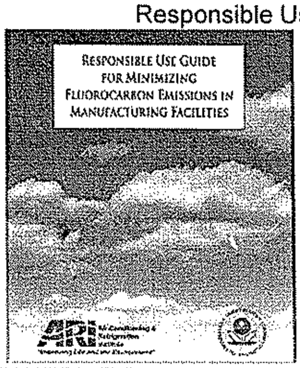
- New chillers have 3 to 5-year economic return in most locations that need cooling for more than 3 months per year
- Variable pump and cooling tower are used to optimize chiller system efficiency
- Variable speed drive (VSD) gaining popularity to dramatically improve part load energy efficiency (IPLV)



Responsible Use

- New chillers should minimize environmental impact and incorporate Responsible Use Principles
  - Contain refrigerants in tight or closed systems and containers minimizing atmospheric releases
  - Encourage monitoring after installations to minimize direct refrigerant emissions and to maintain energy efficiency
  - Train all personnel in proper refrigerant handling
  - Comply with standards on refrigerant safety, proper installation and maintenance (e.g., ASHRAE-15 and ISO- 5149)
  - Design, select, install and operate to optimize energy efficiency
  - Recover, recycle and reclaim refrigerants
  - Continue to improve equipment energy efficiency when cost effective

Air-Conditioning & Refrigeration Institute Responsible Use Guide



- Encourages refrigerant containment in air conditioning and refrigeration equipment manufacturing facilities
- Published by ARI/U.S. EPA in April 2006
- Endorsed by the International Council of Air-Conditioning and Refrigeration Manufacturers' Associations (ICARMA), the Heating, Refrigerating, & Air-Conditioning Institute of Canada (HRAI) and Australia
- ICARMA will undertake translations:

Emission Facts: Greenhouse Gas Emissions from a Typical Passenger Vehicle

EPA420-F-05-004 February 2005

Download a PDF version of this document formatted for print. (6 pp, 54K, About PDF Files)

The U.S. Environmental Protection Agency (EPA) developed this series of four fact sheets to facilitate consistency of assumptions and practices in the calculation of emissions of greenhouse gases from transportation and mobile sources. They are intended as a reference for anyone estimating emissions benefits of mobile sources air pollution control programs.

Issue

Each EPA voluntary climate change program has used slightly different assumptions to translate the greenhouse gas (GHG) reductions associated with the program to the equivalent GHG emissions of a number of cars on the road. The result is that different numbers for the greenhouse gas emissions associated with a passenger vehicle have been used for different programs. The purpose of this fact sheet is to determine consistent assumptions and produce a number that is accepted for the annual GHG emissions associated with a passenger vehicle. The estimate calculated here is for vehicle emissions only, and does not include lifecycle emissions such as emissions associated with the production and distribution of fuel.

top of page

Recommendation

To translate GHG reductions into an equivalent number of cars off the road, annual emissions from a typical passenger vehicle should be equated to 5.5 metric tons of carbon dioxide equivalent or 1.5 metric tons of carbon equivalent.

top of page

Key Steps to the Calculation

There are six key steps to estimate the annual greenhouse gas emissions associated with a passenger vehicle:

1. Determining the carbon dioxide (CO_2) produced per gallon of gasoline
2. Estimating the fuel economy of passenger cars and light trucks (in miles per gallon [mpg])
3. Determining the number of miles driven
4. Determining the emissions of greenhouse gases other than CO_2 (methane [CH_4], nitrous oxide [N_2O], and hydrofluorocarbons [HFCs])
5. Estimating the relative percentages of passenger cars and light trucks
6. Calculating the resulting annual greenhouse gas emissions

Note that for the purposes of this fact sheet, representative values were chosen for each of these variables, despite the fact that in practice variation does occur in these numbers.

Step 1: Determining the CO_2 produced per gallon of gasoline

A gallon of gasoline is assumed to produce 8.8 kilograms (or 19.4 pounds) of CO_2. This number is calculated from values in the Code of Federal Regulations at 40 CFR 600.113-78, which EPA uses to calculate the fuel economy of vehicles, and relies on assumptions consistent with the Intergovernmental Panel on Climate Change (IPCC) guidelines.

In particular, 40 CFR 600.113-78 gives a carbon content value of 2,421 grams (g) of carbon per gallon of gasoline, which produces 8,877 g of CO_2. (The carbon content is multiplied by the ratio of the molecular weight of CO_2 to the molecular weight of carbon: 44/12).

This number is then multiplied by an oxidation factor of 0.99, which assumes that 1 percent of the carbon remains un-oxidized.[1.] This produces a value of 8,788 g or 8.8 kg (19.4 lbs) of CO_2.

⇧Return to Key Steps

Step 2: Estimating the fuel economy of passenger cars and light trucks (MPG estimate)

There are two sources of data which EPA has used for the average fuel economy of passenger cars and light trucks. MOBILE6.2 (EPA's computer model for estimating emissions for highway vehicles) can calculate an average fuel economy across the fleet, based on the EPA annual Fuel Economy Trends reports. For 2003, MOBILE calculates values of 23.9 miles per gallon (mpg) for passenger cars and 17.4 mpg for light trucks. These values are weighted averages (based on vehicle age data for the fleet, including vehicles up to 25 years old) of the Fuel Economy Trends sales-weighted average fuel economy of passenger cars and light trucks for each model year. MOBILE6.2 calculates an overall average fuel economy for passenger vehicles of 20.3 mpg (weighted by vehicle miles traveled [VMT] for passenger cars and light trucks).

The Federal Highway Administration's (FHWA) "Highway Statistics 2001" EXIT Disclaimer gives average values of 22.1 mpg for passenger cars and 17.6 mpg for light trucks as a fleet wide average in for the year 2001 (includes all vehicles on the road in 2001). These values are obtained by dividing vehicle miles traveled by fuel use.[2.] These values are used in the development of the "Inventory of U. S. Greenhouse Gas Emissions and Sinks."

Recommendation: Values were calculated using both sets of fuel economy numbers. Depending on the circumstances, use of one set of numbers or the other may be more appropriate. Generally EPA staff should use the MOBILE6 estimates. However, EPA uses the FHWA numbers in developing the National Inventory for Greenhouse Gas Emissions because they are consistent with the methodology used to develop the inventory. (Note that a small variation in the fuel economy number will not change the rough estimate of greenhouse gases derived here.)

⇧Return to Key Steps

Step 3: Determining the number of miles driven

The number of miles driven per year is assumed to be 12,000 miles for all passenger vehicles. This number is based on several sources. Calculations from EPA's MOBILE6 model show an average annual mileage of roughly 10,500 miles per year for passenger cars and over 12,400 miles per year for light trucks across all vehicles in the fleet. However, these numbers include the oldest vehicles in the fleet (vehicles 25 years of age and older), which are likely not used as primary vehicles and are driven substantially less than newer vehicles. Since this calculation is for a typical vehicle, including the oldest vehicles may not be appropriate. For all vehicles up to 10 years old, MOBILE6 shows an annual average mileage of close to 12,000 miles per year for passenger cars, and over 15,000 miles per year for light trucks.

FHWA's National Highway Statistics contains values of 11,766 miles for passenger cars and 11,140 miles for light trucks across the fleet. However, as with the MOBILE6 fleet-wide estimates, these numbers include the oldest vehicles in the fleet. EPA's Commuter Model uses 1997 data from Oak Ridge Laboratories for the number of cars nationally and number of miles driven which produces a value of just over 12,000 miles per year. Due to the wide range of estimates, 12,000 miles per vehicle is used as a rough estimate for calculating the greenhouse gas emissions from a typical passenger vehicle.)

⇧Return to Key Steps

Step 4: Determining the emissions of greenhouse gases other than CO_2 (N_2O, CH_4, and HFCs)

In addition to carbon dioxide, automobiles produce methane (CH_4) and nitrous oxide (N_2O) from the tailpipe, as well as HFC emissions from leaking air conditioners. The emissions of CH_4 and N_2O are related to vehicle miles traveled rather than fuel consumption, and the emissions of CH_4, N_2O, and HFCs are not as easily estimated from a vehicle as for CO_2.[3.] On average, CH_4, N_2O, and HFC emissions represent roughly 5 - 6 percent of the GHG emissions from passenger vehicles, while CO_2 emissions account for 94-95 percent, accounting for the global warming potential of each greenhouse gas. (These percentages are estimated from the EPA "Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990 - 2001".) To simplify this estimate, it is assumed that CH_4, N_2O, and HFCs account for 5 percent of emissions, and the CO_2 estimate was multiplied by 100/95 to incorporate the contribution of the other greenhouse gases.

Return to Key Steps

Step 5: Estimating the relative percentages of passenger cars and light trucks

Because FHWA calculates fuel economy for passenger cars and light trucks separately, it is necessary to determine the relative percentage of cars and light trucks in order to derive the greenhouse gas emissions for an average passenger vehicle. (This step is not necessary when using the MOBILE6 fuel economy data because MOBILE6 already calculates a weighted average fuel economy for all passenger vehicles.) Passenger cars are assumed to make up 63.4 percent and light trucks make up 36.6 percent of the passenger vehicle fleet. These values are derived from table 6.4 (2000 data) of the "Transportation Energy Data Book: Edition 22," EXIT Disclaimer (published by the Center for Transportation Analysis, Oak Ridge National Laboratory) which states there are 127,721,000 passenger cars on the road and 73,775,000 light trucks (less than 8500 lbs [4.]). Note that this percentage is changing over time, as light trucks now represent roughly 50 percent of annual new vehicle sales.

Return to Key Steps

Step 6: Calculating the resulting annual greenhouse gases from a typical passenger vehicle

A: Using EPA MOBILE6.2 fuel economy numbers

Metric tons of CO_2e for the average passenger vehicle =

(VMT/passenger vehicle avg. MPG) x CO_2 per gallon x (100/95) /1000 =

(12,000/20.3) x 8.8 x (100/95)/1000 =

5.48 metric tons CO_2e for the average passenger vehicle (1.49 metric tons CE)

B: Using DOT fuel economy numbers

[%LDV x (LDVVMT/LDVMPG) x CO_2 per gallon x (100/95) /1000] + [%LDT x (LDTVMT/LDTMPG) x CO_2 per gallon x (100/95) /1000] =

[0.634 x (12,000/22.1) x 8.8 x (100/95)/1000] + [0.366 x (12,000/17.6)] x 8.8 x (100/95)/1000] =

5.03 metric tons CO_2e for passenger cars and 6.32 metric tons CO_2e for light trucks (= 1.37 metric tons CE for cars and 1.72 metric tons CE for trucks) =

5.50 metric tons CO_2e for the average passenger vehicle (1.50 metric tons CE)

Recommendation: To calculate rough translations of GHG reductions into an equivalent number of cars off the road, use 5.5 metric tons of CO_2, or 1.5 metric tons of carbon equivalent. This number is rounded to the nearest tenth of a ton (using either DOT or EPA fuel economy estimates). This rough estimate will also allow for some variability in the underlying variables.

CO_2 only numbers

A: Using EPA MOBILE6.2 fuel economy numbers

Average passenger vehicle = 5.20 metric tons CO_2e (1.42 metric tons CE)

B: Using DOT fuel economy numbers

Passenger Cars = 4.78 metric tons CO_2e (1.30 metric tons CE)
Light Trucks = 6.00 metric tons CO_2e (1.64 metric tons CE)
All passenger vehicles = 5.23 metric tons CO_2e (1.43 metric tons CE)

Recommendation: For CO_2 only estimate, use 5.2 metric tons CO_2e, or 1.4 metric tons CE

Note: These calculations and the supporting data have associated variation and uncertainty. EPA may use other values in certain circumstances, and in some cases it may be appropriate to use a range of values.

[1.] *The International Panel on Climate Change Guidelines (IPCC) recommends a fraction of carbon oxidized factor of 0.99 for all oil and oil-based products. Based on the fundamentals of internal combustion engine design and combustion, EPA is currently examining whether this fraction is higher (closer to 100 percent) for gasoline vehicles in the US.*

[2.] *U.S. Department of Transportation, Federal Highway Administration, "Highway Statistics 2000,"* EXIT Disclaimer *Washington, DC, 2001. Vehicle travel and fuel use data are kept separately for passenger cars and light trucks.*

[3.] EPA is currently examining ways to better disaggregate the HFC emissions from vehicles.

[4.] Vehicles over 8500 lbs are often not included in the light truck category. These vehicles are not required to meet CAFE standards. Examples of these vehicles include the Hummer and the Ford Excursion.

INVENTORY OF U.S. GREENHOUSE GAS EMISSIONS AND SINKS:

1990 – 2007

APRIL 15, 2009

U.S. Environmental Protection Agency
1200 Pennsylvania Ave., N.W.
Washington, DC 20460
U.S.A.

greenhouse gas to trap heat in the atmosphere relative to another gas.

The GWP of a greenhouse gas is defined as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram (kg) of a trace substance relative to that of 1 kg of a reference gas (IPCC 2001). Direct radiative effects occur when the gas itself is a greenhouse gas. The reference gas used is CO_2, and therefore GWP-weighted emissions are measured in teragrams (or million metric tons) of CO_2 equivalent (Tg CO_2 Eq.).[7,8] All gases in this Executive Summary are presented in units of Tg CO_2 Eq.

The UNFCCC reporting guidelines for national inventories were updated in 2006,[9] but continue to require the use of GWPs from the IPCC Second Assessment Report (SAR) (IPCC 1996). This requirement ensures that current estimates of aggregate greenhouse gas emissions for 1990 to 2007 are consistent with estimates developed prior to the publication of the IPCC Third Assessment Report (TAR) and the IPCC Fourth Assessment Report (AR4). Therefore, to comply with international reporting standards under the UNFCCC, official emission estimates are reported by the United States using SAR GWP values. All estimates are provided throughout the report in both CO_2 equivalents and unweighted units. A comparison of emission values using the SAR GWPs versus the TAR and AR4 GWPs can be found in Chapter 1 and, in more detail, in Annex 6.1 of this report. The GWP values used in this report are listed below in Table ES-1.

Table ES-1: Global Warming Potentials (100-Year Time Horizon) Used in this Report

Gas	GWP
CO_2	1
CH_4*	21
N_2O	310
HFC-23	11,700
HFC-32	650
HFC-125	2,800
HFC-134a	1,300
HFC-143a	3,800
HFC-152a	140
HFC-227ea	2,900
HFC-236fa	6,300
HFC-4310mee	1,300
CF_4	6,500
C_2F_6	9,200
C_4F_{10}	7,000
C_6F_{14}	7,400
SF_6	23,900

Source: IPCC (1996)
* The CH_4 GWP includes the direct effects and those indirect effects due to the production of tropospheric ozone and stratospheric water vapor. The indirect effect due to the production of CO_2 is not included.

Global warming potentials are not provided for CO, NO_x, NMVOCs, SO_2, and aerosols because there is no agreed-upon method to estimate the contribution of gases that are short-lived in the atmosphere, spatially variable, or have only indirect effects on radiative forcing (IPCC 1996).

Recent Trends in U.S. Greenhouse Gas Emissions and Sinks

In 2007, total U.S. greenhouse gas emissions were 7,150.1 Tg CO_2 Eq. Overall, total U.S. emissions have risen by 17 percent from 1990 to 2007. Emissions rose from 2006 to 2007, increasing by 1.4 percent (99.0 Tg CO_2 Eq.). The following factors were primary contributors to this increase: (1) cooler winter and warmer summer conditions in 2007 than in 2006 increased the demand for heating fuels and contributed to the increase in the demand for electricity, (2) increased consumption of fossil fuels to generate electricity and (3) a significant decrease (14.2

---

7 Carbon comprises 12/44ths of carbon dioxide by weight.

8 One teragram is equal to 10^{12} grams or one million metric tons.

9 See <http://unfccc.int/resource/docs/2006/sbsta/eng/09.pdf>.

land to agricultural or urban use) or can act as a sink for CO_2 (e.g., through net additions to forest biomass).

Figure ES- 5: 2007 Sources of CO_2 Emissions

As the largest source of U.S. greenhouse gas emissions, CO_2 from fossil fuel combustion has accounted for approximately 79 percent of GWP-weighted emissions since 1990, growing slowly from 77 percent of total GWP-weighted emissions in 1990 to 80 percent in 2007. Emissions of CO_2 from fossil fuel combustion increased at an average annual rate of 1.3 percent from 1990 to 2007. The fundamental factors influencing this trend include (1) a generally growing domestic economy over the last 17 years, and (2) significant overall growth in emissions from electricity generation and transportation activities. Between 1990 and 2007, CO_2 emissions from fossil fuel combustion increased from 4,708.9 Tg CO_2 Eq. to 5,735.8 Tg CO_2 Eq. —a 21.8 percent total increase over the eighteen-year period. From 2006 to 2007, these emissions increased by 100.4 Tg CO_2 Eq. (1.8 percent).

Historically, changes in emissions from fossil fuel combustion have been the dominant factor affecting U.S. emission trends. Changes in CO_2 emissions from fossil fuel combustion are influenced by many long-term and short-term factors, including population and economic growth, energy price fluctuations, technological changes, and seasonal temperatures. On an annual basis, the overall consumption of fossil fuels in the United States generally fluctuates in response to changes in general economic conditions, energy prices, weather, and the availability of non-fossil alternatives. For example, in a year with increased consumption of goods and services, low fuel prices, severe summer and winter weather conditions, nuclear plant closures, and lower precipitation feeding hydroelectric dams, there would likely be proportionally greater fossil fuel consumption than a year with poor economic performance, high fuel prices, mild temperatures, and increased output from nuclear and hydroelectric plants.

Figure ES- 6: 2007 CO_2 Emissions from Fossil Fuel Combustion by Sector and Fuel Type

Figure ES- 7: 2007 End-Use Sector Emissions of CO_2, CH_4, and N_2O from Fossil Fuel Combustion

The five major fuel consuming sectors contributing to CO_2 emissions from fossil fuel combustion are electricity generation, transportation, industrial, residential, and commercial. CO_2 emissions are produced by the electricity generation sector as they consume fossil fuel to provide electricity to one of the other four sectors, or "end-use" sectors. For the discussion below, electricity generation emissions have been distributed to each end-use sector on the basis of each sector's share of aggregate electricity consumption. This method of distributing emissions assumes that each end-use sector consumes electricity that is generated from the national average mix of fuels according to their carbon intensity. Emissions from electricity generation are also addressed separately after the end-use sectors have been discussed.

Note that emissions from U.S. territories are calculated separately due to a lack of specific consumption data for the individual end-use sectors.

Figure ES- 6, Figure ES- 7, and Table ES-3 summarize CO_2 emissions from fossil fuel combustion by end-use sector.

Table ES-3: CO_2 Emissions from Fossil Fuel Combustion by Fuel Consuming End-Use Sector (Tg CO_2 Eq.)

End-Use Sector	**1990**	**1995**	**2000**	**2005**	**2006**	**2007**
Transportation	**1,487.5**	**1,601.7**	**1,803.7**	**1,886.2**	**1,885.4**	**1,892.2**
Combustion	1,484.5	1,598.7	1,800.3	1,881.5	1,880.9	1,887.4
Electricity	3.0	3.0	3.4	4.7	4.5	4.8
Industrial	**1,516.8**	**1,575.5**	**1,629.6**	**1,558.5**	**1,550.7**	**1,553.4**
Combustion	834.2	862.6	844.6	828.0	844.5	845.4
Electricity	682.6	712.9	785.0	730.5	706.2	708.0
Residential	**927.1**	**993.3**	**1,128.2**	**1,207.2**	**1,145.9**	**1,198.0**
Combustion	337.7	354.4	370.4	358.0	321.9	340.6

per kilogram of HCFC-22 manufactured) and the use of thermal oxidation at some plants to reduce HFC-23 emissions.

- SF_6 emissions from electric power transmission and distribution systems decreased by 53 percent (14.1 Tg CO_2 Eq.) from 1990 to 2007, primarily because of higher purchase prices for SF_6 and efforts by industry to reduce emissions.
- PFC emissions from aluminum production decreased by 79 percent (14.7 Tg CO_2 Eq.) from 1990 to 2007, due to both industry emission reduction efforts and lower domestic aluminum production.

Overview of Sector Emissions and Trends

In accordance with the Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories (IPCC/UNEP/OECD/IEA 1997), and the 2003 UNFCCC Guidelines on Reporting and Review (UNFCCC 2003), Figure ES-11 and Table ES-4 aggregate emissions and sinks by these chapters. Emissions of all gases can be summed from each source category from Intergovernmental Panel on Climate Change (IPCC) guidance. Over the eighteen-year period of 1990 to 2007, total emissions in the Energy, Industrial Processes, and Agriculture sectors climbed by 976.7 Tg CO_2 Eq. (19 percent), 28.5 Tg CO_2 Eq. (9 percent), and 28.9 Tg CO_2 Eq. (8 percent), respectively. Emissions decreased in the Waste and Solvent and Other Product Use sectors by 11.5 Tg CO_2 Eq. (6 percent) and less than 0.1 Tg CO_2 Eq. (0.4 percent), respectively. Over the same period, estimates of net C sequestration in the Land Use, Land-Use Change, and Forestry sector increased by 192.5 Tg CO_2 Eq. (23 percent).

Figure ES-11: U.S. Greenhouse Gas Emissions and Sinks by Chapter/IPCC Sector

Table ES-4: Recent Trends in U.S. Greenhouse Gas Emissions and Sinks by Chapter/IPCC Sector (Tg CO_2 Eq.)

Chapter/IPCC Sector	**1990**		**1995**		**2000**		**2005**	**2006**	**2007**
Energy	5,193.6		5,520.1		6,059.9		6,169.2	6,084.4	6,170.3
Industrial Processes	325.2		345.8		356.3		337.6	343.9	353.8
Solvent and Other Product Use	4.4		4.6		4.9		4.4	4.4	4.4
Agriculture	384.2		402.0		399.4		410.8	410.3	413.1
Land Use, Land-Use Change, and Forestry (Emissions)	14.2		16.2		33.0		26.4	45.1	42.9
Waste	177.1		174.7		154.6		160.2	163.0	165.6
Total Emissions	**6,098.7**		**6,463.3**		**7,008.2**		**7,108.6**	**7,051.1**	**7,150.1**
Net CO_2 Flux from Land Use, Land-Use Change, and Forestry (Sinks)*	(841.4)		(851.0)		(717.5)		(1,122.7)	(1,050.5)	(1,062.6)
Net Emissions (Sources and Sinks)	**5,257.3**		**5,612.3**		**6,290.7**		**5,985.9**	**6,000.6**	**6,087.5**

* The net CO_2 flux total includes both emissions and sequestration, and constitutes a sink in the United States. Sinks are only included in net emissions total.
Note: Totals may not sum due to independent rounding. Parentheses indicate negative values or sequestration.

Energy

The Energy chapter contains emissions of all greenhouse gases resulting from stationary and mobile energy activities including fuel combustion and fugitive fuel emissions. Energy-related activities, primarily fossil fuel combustion, accounted for the vast majority of U.S. CO_2 emissions for the period of 1990 through 2007. In 2007, approximately 85 percent of the energy consumed in the United States (on a Btu basis) was produced through the combustion of fossil fuels. The remaining 15 percent came from other energy sources such as hydropower, biomass, nuclear, wind, and solar energy (see Figure ES-12). Energy-related activities are also responsible for CH_4 and N_2O emissions (35 percent and 14 percent of total U.S. emissions of each gas, respectively). Overall, emission sources in the Energy chapter account for a combined 86.3 percent of total U.S. greenhouse gas emissions in 2007.

Figure ES-12: 2007 U.S. Energy Consumption by Energy Source

Fact Sheet -- Proposed Rule: Prevention of Significant Deterioration and Title V Greenhouse Gas Tailoring Rule

ACTION

- On September 30, 2009, EPA announced a proposal that is focused on large facilities emitting over 25,000 tons of greenhouse gases a year. These facilities would be required to obtain permits that would demonstrate they are using the best practices and technologies to minimize GHG emissions.
- The rule proposes new thresholds for greenhouse gas emissions (GHG) that define when Clean Air Act (CAA) permits under the New Source Review (NSR) and title V operating permits programs would be required for new or existing industrial facilities.
- The proposed thresholds would "tailor" the permit programs to limit which facilities would be required to obtain NSR and title V permits and would cover nearly 70 percent of the national GHG emissions that come from stationary sources, including those from the nation's largest emitters—including power plants, refineries, and cement production facilities.
- Small farms, restaurants and many other types of small facilities would not be subject to these permitting programs.
- This proposal addresses the emissions of the group of six greenhouse gases (GHGs) that may be covered by an EPA rule controlling or limiting their emissions:
    1. Carbon dioxide (CO2)
    2. Methane (CH4)
    3. Nitrous oxide (N2O)
    4. Hydrofluorocarbons (HFCs)
    5. Perfluorocarbons (PFCs)
    6. Sulfur hexafluoride (SF6)
- EPA is proposing carbon dioxide equivalent (CO2e) as the preferred metric for determining GHG emissions rates for any combination of these six GHGs, but we are requesting comment in this proposal on alternatives. Emissions of greenhouse gases are typically expressed in a common metric, so that their impacts can be directly compared, as some gases are more potent (have a higher global warming potential or GWP) than others. The international standard practice is to express GHGs in CO2e. Emissions of gases other than CO2 are translated into CO2 equivalents by using the gases' global warming potentials.
- Under the Title V operating permits program, EPA is proposing a major source emissions applicability threshold of 25,000 tons per year (tpy) of carbon dioxide CO2e for existing industrial facilities. Facilities with GHG emissions below this threshold would not be required to obtain an operating permit.
- Under the Prevention of Significant Deterioration (PSD) portion of NSR—which is a permit program designed to minimize emissions from new sources and existing sources making major modifications—EPA is proposing a:
    1. Major stationary source threshold of 25,000 tpy CO2e. This threshold level would be used to determine if a new facility or a major modification at an existing facility would trigger PSD permitting requirements.
    2. Significance level between 10,000 and 25,000 tpy CO2e. Existing major sources making modifications that result in an increase of emissions above the significance level would be required to obtain a PSD permit. EPA is requesting comment on a range of values in this proposal, with the intent of selecting a single value for the GHG significance level.

- Operating permits contain air emissions control requirements that apply to a facility, such as national emissions standards for hazardous air pollutants, new source performance standards, or best available control technologies required by a PSD permit. In general, since there are currently no such air emission control requirements, existing facilities with GHG emissions greater than 25,000 tons per year that already have operating permits would not need to immediately revise them. At the end of a 5-year period when the operating permit must be renewed, these facilities would be required to include estimates of their GHG emissions in their permit applications. Facilities may use the same data reported to EPA under the Mandatory Reporting Rule to fulfill this requirement.
- New or modified facilities with GHG emissions that trigger PSD permitting requirements would need to apply for a revision to their operating permits to incorporate the best available control technologies and energy efficiency measures to minimize GHG emissions. These controls are determined on a case-by-case basis during the PSD process.
- Under the proposed emissions thresholds, EPA estimates that 400 new sources and modifications would be subject to PSD review each year for GHG emissions. Less than 100 of these would be newly subject to PSD. In total, approximately 14,000 large sources would need to obtain operating permits for GHG emissions under the operating permits program. About 3,000 of these sources would be newly subject to CAA operating permit requirements as a result of this action. The majority of these sources are expected to be municipal solid waste landfills.
- Municipal solid waste landfills are the second largest source of human-related methane emissions in the United States, accounting for approximately 23 percent of these emissions in 2007. Landfill methane, a powerful greenhouse gas, can be captured, converted, and used as an energy source, reducing emissions and providing an important renewable energy source.
- The current thresholds for criteria pollutants such as lead, sulfur dioxide and nitrogen dioxide, are 100 and 250 tons per year (tpy). These thresholds are in effect now, and are appropriate for criteria pollutants. However, they are not feasible for GHGs. Without the tailoring rule, these lower thresholds would take effect automatically for GHGs with the adoption of any EPA rule that controls or limits GHG emissions.
- The proposed thresholds would continue to preserve the ability of the NSR and title V operating permit programs to achieve and maintain public health and environmental protection goals while avoiding an administrative burden that would prevent state and local permitting authorities from processing CAA permits efficiently.
- EPA will accept comment on this proposal for 60 days after publication in the *Federal Register.*

NEXT STEPS

- The final emissions thresholds for GHG emissions under the federal PSD and operating permits programs will take effect immediately upon promulgation of the final rule. At that time, EPA will put the new thresholds into effect in state, local and tribal agency programs that run PSD and Title V operating programs under EPA approval. Those agencies will continue to have the option to seek EPA approval for lower thresholds if they demonstrate that they can adequately implement the PSD program at the lower thresholds.
- EPA intends to evaluate ways to streamline the process for identifying GHG emissions control requirements and issuing permits. This will reduce costs and increase efficiency for both sources and for state permitting agencies, which in most cases are responsible for issuing the permits.
- Under the proposal, EPA must also re-evaluate the final GHG emissions thresholds after an initial phase, during which PSD and Title V permitting authorities will gain experience in issuing permits to GHG sources. By the end of the first phase, which is proposed to last five years, the Agency is proposing to complete a study to evaluate whether it is administratively feasible for PSD and Title V permitting authorities to adequately administer their programs at lower GHG thresholds.
- After reviewing the study results, EPA will complete a follow-on regulatory action, within one year (six years following promulgation of this rule). The follow-on rule will establish

thresholds during the second phase, by either:
1. Confirming the need to retain the GHG permitting thresholds for PSD and/or Title V at the levels promulgated with this rulemaking; or
2. Establishing different GHG threshold levels that more accurately reflect the administrative capabilities of permitting authorities to address GHGs.

- EPA believes that a five-year duration for the first phase is appropriate but the Agency requests comment on alternative time periods.
- EPA also plans to develop supporting information to assist permitting authorities as they begin to address permitting actions for GHG emissions for the first time. The guidance would first cover source categories that typically emit GHGs at levels exceeding the thresholds established through this rulemaking.
- Although EPA has not yet identified specific source categories, the Agency plans to develop sector- and source-specific guidance that would help permitting authorities and affected sources better understand GHG emissions for the selected source categories, methods for estimating those emissions, control strategies for GHG emissions, and available GHG measurement and monitoring techniques.
- This guidance also will include approaches for making Best Available Control Technology determinations as required for a PSD permit.

BACKGROUND

- On April 2, 2007, the Supreme Court found that GHGs, including carbon dioxide, are air pollutants covered by the CAA. *Massachusetts v. EPA*, 549 U.S. 497 (2007).
- The Supreme Court found that EPA was required to determine whether or not emissions of GHGs from new motor vehicles cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In April 2009, EPA responded to the Court by proposing a finding that greenhouse gases contribute to air pollution that may endanger public health or welfare.
- EPA expects soon to take final action on the finding. The agency also expects to issue regulations under the Clean Air Act to control GHG emissions from light duty vehicles (proposal signed 9/15/09). Such an action will trigger Clean Air Act permitting requirements under the Prevention of Significant Deterioration (PSD) and Operating Permit (title V) programs for GHG emissions. This will be the first time GHGs would be subject to either of these Clean Air Act permitting programs.
- Congress established the NSR program as part of the 1977 Clean Air Act Amendments and modified it in the 1990 Amendments. NSR is a preconstruction permitting program that serves two important purposes:
  1. Ensures the maintenance of air quality standards or, where there are not air quality standards, it ensures that air quality does not significantly worsen when factories, industrial boilers, and power plants are modified or added. In areas that do not meet the national ambient air quality standards, NSR assures that new emissions do not slow progress toward cleaner air. In areas that meet the standards, especially pristine areas like national parks, NSR assures that new emissions fall within air quality standards.
  2. Ensures that state-of-the-art control technology is installed at new plants or at existing plants that are undergoing a major modification.
- New major stationary sources and major modifications at existing major stationary sources that meet emissions applicability thresholds outlined in the Clean Air Act and in existing PSD regulations must obtain a PSD permit outlining how they will control emissions. The permit requires facilities to apply best available control technology (BACT), which is determined on a case-by-case basis taking into account, among other factors, the cost and effectiveness of the control.
- The Clean Air Act Amendments of 1990 required that all states develop operating permit programs. Under these programs, known as Title V operating permits programs, every major industrial source of air pollution (and some other sources) must obtain an operating permit. The permits, which are reviewed every five years, contain all air emission control

requirements that apply to the facility, including the requirements established as part of the preconsturction permitting process.

HOW TO COMMENT

- EPA will accept comment on the proposal for 60 days after publication in the Federal Register. Comments, identified by Docket ID No. EPA-HQ-OAR-2009-0517, may be submitted by one of the following methods:
  - www.regulations.gov: Follow the online instructions for submitting comments.
  - E-mail: Comments may be sent by electronic mail (e-mail) to a-and-r-docket@epa.gov.
  - Fax: Fax your comments to: (202) 566-9744.
  - Mail: Send your comments to: EPA Docket Center, EPA West (Air Docket), Attention Docket ID No. EPA-HQ-OAR-2009-0517, U.S. Environmental Protection Agency, Mailcode: 2822T, 1200 Pennsylvania Avenue, NW, Washington, DC 20460.
  - Hand Delivery or Courier: Deliver your comments to: .S. Environmental Protection Agency, EPA West (Air Docket), 1301 Constitution Avenue, Northwest, Room 3334, Washington, DC 20004, Attention Docket ID No. EPA-HQ-OAR-2009-0517. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information

FOR MORE INFORMATION

- To download a copy of this notice, go to EPA's Web site at: http://www.epa.gov/nsr.
- Today's proposed action and other background information are also available electronically at http://www.regulations.gov, EPA's electronic public docket and comment system. The docket number for this action is Docket ID No. EPA-HQ-OAR-2009-0517.
- For more information on the final rule, contact Joseph Mangino at (919) 541-9778 or mangino.joseph@epa.gov.

Summary of the Science Supporting EPA's Finding That Greenhouse Gases Threaten Public Health and Welfare

For a full discussion of the rationale for EPA's proposed findings, please see the Proposal describing the findings as well the underlying Technical Support Document for a comprehensive synthesis of the science at: www.epa.gov/climatechange/endangerment.html. *All of the points in this fact sheet come from the published scientific literature, particularly from the assessments of the U.S. Climate Change Science Program, the National Research Council, and the Intergovernmental Panel on Climate Change.*

Key Points About Climate Change:

- Heat-trapping greenhouse gases are now at record-high levels in the atmosphere compared to the recent and distant past.
- These high atmospheric levels are the clear result of human emissions of carbon dioxide and other greenhouse gases.
- Warming of the climate system is now well documented, as is evident from increases in global average air and ocean temperatures, widespread melting of snow and ice, and rising global average sea level. Eight of the 10 warmest years on record have occurred since 2001.
- The buildup of greenhouse gases in the atmosphere is very likely the cause of the observed increase in average temperatures and other climatic changes. Most of the warming cannot be explained by natural variability such as variations in solar activity.
- Future warming over the course of the 21st century, even when assuming emissions growth will be low, is very likely to be greater than observed warming over the past century.
- The effects of climate change observed to date and/or projected to occur in the future include, but are not limited to: more frequent and intense heat waves, more wildfires, degraded air quality, more heavy downpours and flooding, increased drought, greater sea level rise, more intense storms, harm to water resources, harm to agriculture, and harm to wildlife and ecosystems.
- The changes to our climate may increase the likelihood of extreme and high-impact events such as more intense hurricanes.

Health Effects Associated With Elevated Greenhouse Gas Concentrations in the United States

Temperature Effects:

- There is evidence that extremely hot days are already increasing. Severe heat waves are projected to intensify, which can increase heat-related mortality and sickness. A possible benefit of moderate temperature increases includes fewer deaths from exposure to extreme cold.

Air Quality Changes:

- Climate change is expected to worsen regional ozone pollution, with associated risks in respiratory infection, aggravation of asthma, and premature death. The impact on particulate matter remains less certain.

Extreme Events:

- Storm impacts are likely to be more severe, especially along the Gulf and Atlantic coasts. Heavy rainfall events are expected to increase, increasing the risk of flooding, greater runoff and erosion, and thus the potential for adverse water quality effects. These projected trends can increase the number of people at risk from suffering disease and injury due to floods, storms, droughts and fires.

Climate-Sensitive Diseases:

- Potential ranges of certain diseases affected by temperature and precipitation changes, including tick-borne diseases, are expected to increase.

Welfare Effects Associated With Elevated Greenhouse Gas Concentrations in the United States

Under the Clean Air Act, "welfare" includes impacts such as effects on soils, water, crops, vegetation, man-made materials, animals, wildlife, weather, visibility, and climate; damage to and deterioration of property and hazards to transportation; as well as effects on economic values and on personal comfort and well-being.

- The global sea level gradually rose in the 20th century and is currently rising at an increased rate, exacerbating storm-surge flooding and shoreline erosion.
- Rising temperatures will diminish snowpack in the Western U.S., affecting seasonal availability of water.
- Climate change will likely further constrain already over-allocated water resources in some areas of the U.S., increasing competition among agricultural, municipal, industrial, and ecological uses.
- Modest climate change, plus elevated CO_2, may bring agricultural yield increases in the near term. But, as temperatures continue to rise, these crops will increasingly begin to experience failure. Increases in regional ozone levels will also adversely impact certain crops.
- Climate change has very likely already increased the size and number of forest fires, insect outbreaks, and tree mortality in the interior West, the Southwest, and Alaska, and will continue to do so.
- Changes in climate will cause species to shift north and to higher elevations and fundamentally rearrange U.S. ecosystems.
- Ocean acidification is projected to continue, which can affect the productivity of marine life such as corals.
- Climate change impacts in certain regions of the world may exacerbate problems that raise humanitarian, trade, and national security issues for the United States.

This fact sheet is intended to assist the public to understand key aspects of the proposal. However, this fact sheet is not intended to be a substitution for the proposal itself. Visit EPA's website at the address above for more information, including the proposal, or go to www.regulations.gov to access the rulemaking docket (EPA-HQ-OAR-2009-0171) which will be opened when the proposal is published in the Federal Register. For questions that cannot be answered through the Web site or docket, call 202-343-9927.

Environmental Protection Agency

California State Motor Vehicle Pollution Control Standards; Notice of Decision Granting a Waiver of Clean Air Act Preemption for California's 2009 and Subsequent Model Year Greenhouse Gas Emission Standards for New Motor Vehicles; Notice

ENVIRONMENTAL PROTECTION AGENCY

[FRL–8927–2]

California State Motor Vehicle Pollution Control Standards; Notice of Decision Granting a Waiver of Clean Air Act Preemption for California's 2009 and Subsequent Model Year Greenhouse Gas Emission Standards for New Motor Vehicles

SUMMARY: The Environmental Protection Agency (EPA) is granting the California Air Resources Board's (CARB's) request for a waiver of Clean Air Act preemption to enforce its greenhouse gas emission standards for model year 2009 and later new motor vehicles. This decision is under section 209(b) of the Clean Air Act (the ''Act''), as amended. This decision withdraws and replaces EPA's prior denial of the CARB's December 21, 2005 waiver request, which was published in the **Federal Register** on March 6, 2008.

DATES: Petitions for review must be filed by September 8, 2009.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2006–0173. All documents and public comments in the docket are listed on the *www.regulations.gov* Web site. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the Air and Radiation Docket in the EPA Headquarters Library, EPA West Building, Room 3334, 1301 Constitution Ave., NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding holidays. The telephone number for the Reading Room is (202) 566–1744. The Air and Radiation Docket and Information Center's Web site is *http://www.epa.gov/oar/docket.html.* The electronic mail (e-mail) address for the Air and Radiation Docket is: *a-and-r-Docket@epa.gov,* the telephone number is (202) 566–1742 and the fax number is (202) 566–9744.

FOR FURTHER INFORMATION CONTACT: Specific questions may be addressed to David Dickinson, Office of Transportation and Air Quality, Compliance and Innovative Strategies Division (6405J–NLD), EPA, 1200 Pennsylvania Ave., NW., Washington, DC 20460, telephone: (202) 343–9256, e-mail: *Dickinson.David@epa.gov.*

SUPPLEMENTARY INFORMATION:

Table of Contents

I. Executive Summary

Today, I, as Administrator of the Environmental Protection Agency, am granting California's request for a waiver of Clean Air Act preemption for California's greenhouse gas emission standards for 2009 and later model years of new motor vehicles, adopted by the California Air Resources Board on September 24, 2004. This decision withdraws and replaces EPA's previous March 6, 2008 Denial of California's waiver request.

In the March 6, 2008 Denial, EPA determined that one of the three criteria for denial of a waiver had been met, namely, that California did not need its

State standards to meet compelling and extraordinary conditions. I have reconsidered that determination, which was based on an interpretation of section 209(b)(1) of the Clean Air Act that I now reject. Based on a review of the statutory language, legislative history, and the comments received, I am returning to EPA's traditional interpretation of this provision. Applying EPA's traditional interpretation I have determined that the waiver should not be denied under this criterion. Since the March 6, 2008 Denial did not evaluate or make any determinations concerning either of the other two waiver criteria, I have evaluated those criteria and determined that the waiver should not be denied under either of them. This includes careful consideration of all of the evidence presented concerning technological feasibility of the model year 2009 and later model year standards, considering lead time and the cost of implementation.

The legal framework for this decision stems from the waiver provision first adopted by Congress in 1967, and later modified in 1977. Congress established that there would be only two programs for control of emissions from new motor vehicles—EPA emission standards adopted under the Clean Air Act and California emission standards adopted under its state law. Congress accomplished this by preempting all state and local governments from adopting or enforcing emission standards for new motor vehicles, while at the same time providing that California could receive a waiver of preemption for its emission standards and enforcement procedures. This struck an important balance that protected manufacturers from multiple and different state emission standards, and preserved a pivotal role for California in the control of emissions from new motor vehicles. Congress recognized that California could serve as a pioneer and a laboratory for the nation in setting new motor vehicle emission standards. Congress intentionally structured this waiver provision to restrict and limit EPA's ability to deny a waiver, and did this to ensure that California had broad discretion in selecting the means it determined best to protect the health and welfare of its citizens. Section 209(b) specifies that EPA must grant California a waiver if California determines that its standards are, in the aggregate, at least as protective of the public health and welfare as applicable Federal standards. EPA may deny a waiver only if it makes at least one of three findings specified under the Clean Air Act (including whether California's "protectiveness finding" noted above is arbitrary and capricious). Therefore, EPA's role upon receiving a request for waiver of preemption from California is to determine whether it is appropriate to make any of the three findings specified by the Clean Air Act and if the Agency cannot make at least one of the three findings then the waiver must be granted. The three waiver criteria are properly seen as criteria for a denial—EPA must grant the waiver unless at least one of three criteria for a denial is met. This is different from most waiver situations before the Agency, where EPA typically determines whether it is appropriate to make certain findings necessary for granting a waiver, and if the findings are not made then a waiver is denied. This reversal of the normal statutory structure embodies and is consistent with the congressional intent of providing deference to California to maintain its own new motor vehicle emissions program.

The three criteria for denial of a waiver are: First, whether California's determination that its standards are, in the aggregate, at least as protective as applicable Federal standards is arbitrary and capricious (Section 209(b)(1)(A)); second, whether California has a need for such standards to meet compelling and extraordinary conditions (Section 209(b)(1)(B)); and third, whether California's standards are consistent with Section 202(a) of the Act (Section 209(b)(1)(C)). EPA has consistently interpreted the waiver provision as placing the burden on the opponents of a waiver to demonstrate that one of the criteria for a denial has been met. In this context, since 1970, EPA has recognized its limited discretion in reviewing California waiver requests. EPA has granted over 50 waivers of preemption and has only fully denied one waiver request, the decision under reconsideration here.

In this case, California first requested that EPA waive preemption for its new motor vehicle greenhouse gas emission standards on December 21, 2005. EPA did not begin its formal consideration of the waiver request until after the *Massachusetts* v. *EPA* decision in April 2007, in which the Supreme Court determined that greenhouse gases are air pollutants within that term's meaning in the Clean Air Act. On March 6, 2008, after an administrative process that included two public hearings and a written comment period, EPA published its final decision denying California's request. EPA's waiver denial was based on the second waiver criterion, with EPA determining that California did not need its greenhouse gas standards to meet compelling and extraordinary conditions. EPA did not address the other two waiver criteria.

The reconsideration process started early this year. On January 21, 2009, California Governor Schwarzenegger sent a letter to President Obama, and the California Air Resources Board sent a letter to Administrator-designee Jackson, requesting the Agency reconsider the prior denial. After reviewing CARB's reconsideration request and the concerns raised by many different parties, EPA found that there were significant issues regarding the Agency's denial of the waiver. The denial was a substantial departure from EPA's longstanding interpretation of the Clean Air Act's waiver provision and EPA's history of granting waivers to California for its new motor vehicle emissions program. Many different parties, including California, states that have adopted or are interested in adopting California's standards, members of Congress, scientists, and other stakeholders, had expressed similar concerns about the denial of the waiver. Based on this, EPA believed there was merit to reconsidering its decision denying California's waiver request and on February 12, 2009, EPA published a **Federal Register** notice announcing its reconsideration of California's greenhouse gas waiver request. EPA held a public hearing on March 5, 2009, and received written comments through April 6, 2009.

EPA received substantial comment on each of the three waiver criteria. The entire administrative process in consideration of California's request provided the Agency with extensive legal argument and evidence, including oral testimony from three public hearings and nearly 500,000 written comments. This material has been substantive and invaluable in the Agency's review. EPA has received extensive comments from many states; federal, state and local officials; industry; environmental groups; scientists; and other stakeholders. The vast majority of comments EPA received were in support of the waiver.

After a thorough evaluation of the record, I am withdrawing EPA's March 6, 2008 Denial and have determined that the most appropriate action in response to California's greenhouse gas waiver request is to grant that request. I have determined that the waiver opponents have not met their burden of proof in order for me to deny the waiver under any of the three criteria in section 209(b)(1). The findings I have made concerning each of the criteria are summarized below.

Concerning the criterion with respect to the protectiveness of California's standards in the aggregate, I find that the opponents of the waiver have not met their burden to demonstrate that California's determination was arbitrary and capricious. This evaluation can properly by made in situations where EPA has not issued its own standards, and this finding is appropriate whether or not comparison is made to EPA's current emissions standards or the National Highway Transportation Safety Administration's (NHTSA's) fuel economy standards, and whether or not it includes an evaluation of the real-world in-use effect of California's greenhouse gas standards on its broader motor vehicle program.

With respect to the criterion concerning the need for California's state standards to meet compelling and extraordinary conditions, I have found that the March 6, 2008 Denial was based on an inappropriate interpretation of the waiver provision. The March 6, 2008 Denial determined that Congress intended to allow California to promulgate only those state standards that address pollution problems that are local or regional, and this provision was not intended to allow California to promulgate state standards designed to address global climate change problems. In the alternative, EPA found that the effects of climate change in California are not compelling and extraordinary compared to the effects in the rest of the country.

The text of section 209(b) and the legislative history, when viewed together, lead me to reject the interpretation adopted in the March 6, 2008 Denial, and to apply the traditional interpretation to the evaluation of California's greenhouse gas standards for motor vehicles. If California needs a separate motor vehicle program to address the kinds of compelling and extraordinary conditions discussed in the traditional interpretation, then Congress intended that California could have such a program. Congress also intentionally provided California the broadest possible discretion in adopting the kind of standards in its motor vehicle program that California determines are appropriate to address air pollution problems and protect the health and welfare of its citizens. The better interpretation of the text and legislative history of this provision is that Congress did not use this criterion to limit California's discretion to a certain category of air pollution problems, to the exclusion of others.

Under that interpretation, I cannot find that opponents of the waiver have demonstrated that California does not need its state standards to meet compelling and extraordinary conditions. The opponents of the waiver have not adequately demonstrated that California no longer has a need for its motor vehicle emissions program. I have also determined that even under the interpretation announced in the March 6, 2008 Denial, opponents of the waiver have not demonstrated that California does not need its greenhouse gas emission standards to meet compelling and extraordinary conditions. In addition, I have interpreted the ''compelling and extraordinary conditions'' criterion to not properly include a consideration of whether the impacts from climate change are compelling and extraordinary in California. Nevertheless, I have evaluated the comments received and evidence in the record and have determined that the opponents of the waiver have not met their burden in demonstrating why evidence such as the impacts of climate change on existing ozone conditions in California along with the cumulative impacts identified by proponents of the waiver (*e.g.,* impacts on snow melt and water resources and agricultural water supply, wildfires, coastal habitats, ecosystems, etc.) is not compelling and extraordinary.

Concerning the criterion with respect to consistency of the greenhouse gas emission standards with section 202(a), EPA has reviewed extensive comments and records received from California and from the regulated community concerning the kinds of technology needed to comply with California's standards, including costs and lead time, as well as evidence concerning the current compliance status of manufacturers. In light of the previous waiver denial, EPA specifically asked for comment on how lead time should be evaluated as part of the Agency's reconsideration. Based on all of that information, I cannot find that opponents of the waiver have demonstrated that the greenhouse gas emission standards are inconsistent with section 202(a). While I believe that a grant of the waiver for model year 2009 would not be a retroactive change in the law, to limit any potential concerns that have been raised by the manufacturers over their potential reliance upon EPA's previous waiver denial, my decision provides that CARB may not hold a manufacturer liable or responsible for any noncompliance civil penalty action caused by emission debits generated by a manufacturer for the 2009 model year.

EPA finds that those opposing the waiver request have not met the burden of demonstrating that California's regulations do not satisfy the statutory criteria of section 209(b). For this reason, I am granting California's waiver request to enforce its greenhouse gas motor vehicle emission regulations.

II. Background

A. California's Greenhouse Gas Program for New Motor Vehicles

As further explained below, CARB has adopted amendments to title 13, California Code of Regulations (CCR), sections 1900 and 1961, and established standards to regulate greenhouse gas (GHG) emissions from new passenger cars, light-duty trucks and medium-duty vehicles in a new section 1961.1.

California's GHG standards are included as part of its second generation low-emission vehicle program known as LEV II. EPA previously issued a waiver for the LEV II program and also issued a waiver for CARB's zero-emission vehicle program (known as ZEV) through the 2011 model year (MY).[1] By Resolution 04–28, CARB approved the GHG standards for motor vehicles on September 24, 2004, and California's Office of Administrative Law approved the regulations on September 15, 2005.[2]

CARB's regulation covers large-volume motor vehicle manufacturers beginning in the 2009 model year, and intermediate and small manufacturers beginning in the 2016 model year and controls greenhouse gas emissions from two categories of new motor vehicles—passenger cars and the lightest trucks (PC and LDT1) and heavier light-duty trucks and medium-duty passenger vehicles (LDT2 and MDPV). The regulations add four new greenhouse gas air contaminants (carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and hydrofluorocarbons (HFCs)) to California's existing regulations for criteria and criteria-precursor pollutants and air toxic contaminants. There are separate fleet average emission standards for the two vehicle size categories and within each category the sales-weighted average of a manufacturer's vehicles is required to comply with the standard. The regulations establish a manufacturer declining fleet average emission standard for these gases (expressed as grams of carbon dioxide equivalent per mile (''gpm'')), with separate standards for each of the two categories of passenger vehicles noted above. CARB places the declining standards into two phases: near-term standards phased in

[1] 68 FR 19811 (April 22, 2003) and 71 FR 78190 (December 26, 2006).

[2] California Air Resources Board, EPA–HQ–OAR–2006–0173–0004.2.

from the 2009 through 2012 model years, and mid-term standards, phased in from the 2013 through 2016 model years. Manufacturers may receive credits for meeting the standards before model year 2009, for surpassing the standards in later model years, and for selling alternative fuel vehicles. These credits may be banked for later use, transferred between vehicle categories, or sold to another manufacturer. If a manufacturer fails to meet the standard in a particular model year, it will begin to accrue debits. At that point it will have five years to make up for the debits, either by generating credits, or by purchasing credits from another manufacturer.

B. EPA's Consideration of CARB's Request

By letter dated December 21, 2005, CARB submitted a request (''Waiver Request'') seeking a waiver of Section 209(a)'s prohibition for its motor vehicle GHG standards.[3] On February 21, 2007, EPA notified the Executive Officer of CARB that the timing of EPA's consideration of the GHG waiver request was related to the then-pending *Massachusetts* v. *EPA* case before the United States Supreme Court. EPA stated that the decision in that case could potentially be relevant to issues EPA might address in the context of the GHG waiver proceeding. The Supreme Court issued its *Massachusetts* v. *EPA* decision on April 2, 2007, finding that greenhouse gases are air pollutants under the Clean Air Act, and that EPA is required to decide the pending rulemaking petition under section 202(a) of the Act, based on the statutory criteria of whether, in the Administrator's judgment, emissions of greenhouse gases from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare.[4]

On April 30, 2007, a **Federal Register** notice was published announcing an opportunity for hearing and comment on CARB's request.[5] EPA subsequently held two public hearings on May 22, 2007, in Washington, DC, and on May 30, 2007, in Sacramento, CA. The written comment period closed on June 15, 2007. On several occasions, EPA received requests to extend or re-open the comment period; however, the Agency did not extend the June 15, 2007 deadline. The Agency instead indicated that consistent with past waiver practice it would continue, as appropriate, to communicate with stakeholders and evaluate any comments submitted after the close of the comment period to the extent practicable. By letter dated December 19, 2007, EPA notified California Governor Schwarzenegger that EPA would be denying the waiver. On March 6, 2008, EPA published its decision denying California's waiver request (March 6, 2008 Denial).[6]

EPA's March 6, 2008 Denial was based on a finding that California did not need its GHG standards for new motor vehicles to meet compelling and extraordinary conditions. Because this finding was sufficient to deny California's waiver request, the Administrator found it unnecessary to determine whether the criteria for denial of a waiver under sections 209(b)(1)(A) and (C) had been met.

On January 21, 2009, CARB submitted a request for EPA to reconsider its March 6, 2008 Denial (''Reconsideration Request'').[7] CARB's Reconsideration Request stated its belief that EPA has the inherent authority to reconsider its previous waiver denial and EPA should do so in order to restore the Agency's interpretations and applications of the Clean Air Act to continue California's longstanding leadership role in setting emission standards. Specifically, CARB noted several bases for the reconsideration centered on EPA's misinterpretation of the Clean Air Act to set new flawed tests and misapplication of facts to those tests.

President Obama issued a Presidential Memorandum to the Administrator of the Environmental Protection Agency on January 26, 2009, stating that ''In order to ensure that the EPA carries out its responsibilities for improving air quality, you are hereby requested to assess whether the EPA's decision to deny a waiver based on California's application was appropriate in light of the Clean Air Act. I further request that, based on that assessment, the EPA initiate any appropriate action.'' [8]

Subsequently, EPA published a **Federal Register** notice on February 12, 2009, which responded to CARB's reconsideration request and announced that EPA would fully review and reconsider its March 6, 2008 Denial.[9] The February 12, 2009 notice specifically sought comment on: any new or additional information regarding the three section 209(b) waiver criteria; whether EPA's interpretation and application of section 209(b)(1)(B) in the March 6, 2008 Denial was appropriate; and, the effect of the waiver denial on whether CARB's GHG standards are consistent with section 202(a), including lead time. After holding a public hearing on March 5, 2009, the written comment period closed on April 6, 2009.

III. Analysis of Preemption Under Section 209(a) of the Clean Air Act

A. Clean Air Act Preemption Provisions

Section 209(a) of the Act provides:

> No State or any political subdivision thereof shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part. No State shall require certification, inspection or any other approval relating to the control of emissions from any new motor vehicle or new motor vehicle engine as condition precedent to the initial retail sale, titling (if any), or registration of such motor vehicle, motor vehicle engine, or equipment.[10]

Section 209(b)(1) of the Act requires the Administrator, after an opportunity for public hearing, to waive application of the prohibitions of section 209(a) for any State that has adopted standards (other than crankcase emission standards) for the control of emissions from new motor vehicles or new motor engines prior to March 30, 1966, if the State determines that its State standards will be, in the aggregate, at least as protective of public health and welfare as applicable Federal standards.[11] However, no such waiver shall be granted by the Administrator if she finds that: (A) The protectiveness determination of the State is arbitrary and capricious; (B) the State does not need such State standards to meet compelling and extraordinary conditions; or (C) such State standards and accompanying enforcement procedures are not consistent with section 202(a) of the Act. In previous waiver decisions, EPA has stated that Congress intended EPA's review of California's decision-making be narrow. This has led EPA to reject arguments that are not specified in the statute as grounds for denying a waiver:

[3] California Air Resources Board, EPA–HQ–OAR–2006–0173–0004.

[4] *Massachusetts* v. *EPA,* 549 U.S. 497, 127 S. Ct. 1438 (2007). On April 24, 2009, EPA issued ''Proposed Endangerment and Cause or Contribute Findings for Greenhouse Gases under Section 202(a) of the Clean Air Act'' at 74 FR 18885 (April 24, 2009).

[5] 72 FR 21260 (April 30, 2007).

[6] 73 FR 12156 (March 6, 2008). The State of California brought litigation against EPA in the United States Court of Appeals, DC Circuit. This litigation is held in abeyance pending further order of the court. (February 25, 2009).

[7] California Air Resources Board, EPA–HQ–OAR–2006–0173–7044.

[8] 74 FR 4905 (January 28, 2009).

[9] 74 FR 7040 (February 12, 2009).

[10] Clean Air Act section 209(a).

[11] California is the only State which meets section 209(b)(1)'s requirement for obtaining a waiver. *See* S. Rep. No. 90–403 at 632 (1967).

The law makes it clear that the waiver requests cannot be denied unless the specific findings designated in the statute can properly be made. The issue of whether a proposed California requirement is likely to result in only marginal improvement in air quality not commensurate with its cost or is otherwise an arguably unwise exercise of regulatory power is not legally pertinent to my decision under section 209, so long as the California requirement is consistent with section 202(a) and is more stringent than applicable Federal requirements in the sense that it may result in some further reduction in air pollution in California.[12]

Thus, my consideration of all the evidence submitted concerning a waiver decision is circumscribed by its relevance to those questions that I may consider under section 209(b).

B. Deference to California

In previous waiver decisions, EPA has recognized that the intent of Congress in creating a limited review based on the section 209(b)(1) criteria was to ensure that the federal government did not second-guess the wisdom of state policy. This has led EPA to state:

It is worth noting * * * I would feel constrained to approve a California approach to the problem which I might also feel unable to adopt at the federal level in my own capacity as a regulator. The whole approach of the Clean Air Act is to force the development of new types of emission control technology where that is needed by compelling the industry to ''catch up'' to some degree with newly promulgated standards. Such an approach * * * may be attended with costs, in the shaped of reduced product offering, or price or fuel economy penalties, and by risks that a wider number of vehicle classes may not be able to complete their development work in time. Since a balancing of these risks and costs against the potential benefits from reduced emissions is a central policy decision for any regulatory agency under the statutory scheme outlined above, I believe I am required to give very substantial deference to California's judgments on this score.[13]

EPA has stated that the text, structure, and history of the California waiver provision clearly indicate both a congressional intent and appropriate EPA practice of leaving the decision on ''ambiguous and controversial matters of public policy'' to California's judgment.[14]

The House Committee Report explained as part of the 1977 amendments to the Clean Air Act, where Congress had the opportunity to restrict the waiver provision, it elected instead to explain California's flexibility to adopt a complete program of motor vehicle emission controls. The amendment is intended to ratify and strengthen the California waiver provision and to affirm the underlying intent of that provision, *i.e.,* to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare.[15]

C. Burden of Proof

In *Motor and Equip. Mfrs Assoc.* v. *EPA,* 627 F.2d 1095 (DC Cir. 1979) (*MEMA I*), the U.S. Court of Appeals stated that the Administrator's role in a section 209 proceeding is to:

consider all evidence that passes the threshold test of materiality and * * * thereafter assess such material evidence against a standard of proof to determine whether the parties favoring a denial of the waiver have shown that the factual circumstances exist in which Congress intended a denial of the waiver.[16]

The court in *MEMA I* considered the standards of proof under section 209 for the two findings necessary to grant a waiver for an ''accompanying enforcement procedure'' (as opposed to the standards themselves): (1) Protectiveness in the aggregate and (2) consistency with section 202(a) findings. The court instructed that ''the standard of proof must take account of the nature of the risk of error involved in any given decision, and it therefore varies with the finding involved. We need not decide how this standard operates in every waiver decision.'' [17]

The court upheld the Administrator's position that, to deny a waiver, there must be 'clear and compelling evidence' to show that proposed procedures undermine the protectiveness of California's standards.[18] The court noted that this standard of proof also accords with the congressional intent to provide California with the broadest possible discretion in setting regulations it finds protective of the public health and welfare.[19]

With respect to the consistency finding, the court did not articulate a standard of proof applicable to all proceedings, but found that the opponents of the waiver were unable to meet their burden of proof even if the standard were a mere preponderance of the evidence. Although *MEMA I* did not explicitly consider the standards of proof under section 209 concerning a waiver request for ''standards,'' as compared to accompanying enforcement procedures, there is nothing in the opinion to suggest that the court's analysis would not apply with equal force to such determinations. EPA's past waiver decisions have consistently made clear that: ''[E]ven in the two areas concededly reserved for Federal judgment by this legislation—the existence of compelling and extraordinary' conditions and whether the standards are technologically feasible—Congress intended that the standards of EPA review of the State decision to be a narrow one.'' [20]

Finally, opponents of the waiver bear the burden of showing that the criteria for a denial of California's waiver request has been met. As found in *MEMA I,* this obligation rests firmly with opponents of the waiver in a section 209 proceeding, holding that: ''[t]he language of the statute and it's legislative history indicate that California's regulations, and California's determinations that they must comply with the statute, when presented to the Administrator are presumed to satisfy the waiver requirements and that the burden of proving otherwise is on whoever attacks them. California must present its regulations and findings at the hearing and thereafter the parties opposing the waiver request bear the burden of persuading the Administrator that the waiver request should be denied.'' [21]

The Administrator's burden, on the other hand, is to make a reasonable evaluation of the information in the record in coming to the waiver decision. As the court in *MEMA I* stated, ''Here, too, if the Administrator ignores evidence demonstrating that the waiver should not be granted, or if he seeks to overcome that evidence with unsupported assumptions of his own, he runs the risk of having his waiver decision set aside as 'arbitrary and capricious.' '' [22] Therefore, the Administrator's burden is to act ''reasonably.'' [23]

EPA received comment suggesting that the burden of proof upon reconsideration of EPA's March 6, 2008 Denial should be reversed and placed on California.[24] It is not clear whether

[12] 36 FR 17458 (Aug. 31, 1971). Note that the more stringent standard expressed here, in 1971, was superseded by the 1977 amendments to section 209, which established that California must determine that its standards are, in the aggregate, at least as protective of public health and welfare as applicable Federal standards.

[21] *MEMA I,* 627 F.2d at 1121.

[22] *Id.* at 1126.

[23] *Id.* at 1126.

[24] Alliance of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–8994 at 6–7.

the commenter is also suggesting that the entire burden of proof now shifts to California in that ''[s]uch an allocation of the burden of proof ensures that decisions in which EPA has invested time and resources are not lightly overturned, and that those decisions enjoy the finality to which they are entitled.'' Moreover, the commenter suggests that EPA carries a separate responsibility, in order to reverse its prior decision, to explain why its first decision on the waiver request is no longer the correct one. The commenter cites several cases for the proposition that ''[A]n agency changing its course * * * is obligated to supply a reasoned analysis for the change beyond that which may be required when an agency does not act in the first instance'' and that an agency must offer sufficient explanation to ensure the court that it is not ''repudiating precedent to conform with shifting political mood.''[25]

EPA believes that, regardless of the previous waiver denial, once California makes its protectiveness determination the burden of proof falls on the opponents of the waiver. This burden is inherent in the statutory requirement that EPA grant the waiver unless it makes one of the specific negative findings in section 209(b)(1).[26] This is consistent with the legislative history, which indicates that Congress intended a narrow review by EPA and to preserve the broadest possible discretion for California.[27]

As EPA explained in the previous waiver denial, the Agency did not address the section 209(b)(1)(A) and (C) criteria in its decision; therefore EPA is not in a position of reversing any interpretations or evidentiary findings. As further discussed in section VI, although commenters argue various adverse effects of the prior waiver denial on lead time, the burden remains on the opponents of the waiver to demonstrate why California's GHG standards are not consistent with section 202(a). With regard to section 209(b)(1)(B) and EPA's prior waiver denial, EPA has provided a reasoned analysis and explanation for any reversal of positions taken in this new decision. In the context of this reasoned explanation, EPA believes it is only required to demonstrate that it is aware that it is changing positions and that there are good reasons for the change in position.[28] As discussed above, the burden of proof under section 209(b)(1)(B) still falls on those who wish EPA to deny the waiver, based on the statutory structure of section 209(b)(1) and the legislative history. This requirement is not disturbed by EPA's initial denial.

IV. California's Protectiveness Determination

Section 209(b)(1)(A) of the Act requires EPA to deny a waiver if the Administrator finds that California was arbitrary and capricious in its determination that its State standards will be, in the aggregate, at least as protective of public health and welfare as applicable Federal standards. EPA recognizes that the phrase ''States standards'' means the entire California new motor vehicle emissions program. Therefore, as explained below, when evaluating California's protectiveness determination, EPA compares the California-to-Federal standards. That comparison is undertaken within the broader context of the previously waived California program, which relies upon protectiveness determinations that EPA have previously found were not arbitrary and capricious.[29]

Traditionally, EPA has evaluated the stringency of California's standards relative to comparable EPA emission standards.[30] That evaluation follows the instruction of section 209(b)(2), which states: ''If each State standard is at least as stringent as the comparable applicable Federal standard, such State standard shall be deemed to be at least as protective of health and welfare as such Federal standards for purposes of [209(b)(1)].''

To review California's protectiveness determination in light of section 209(b)(2), EPA conducts its own analysis of the newly adopted California standards to comparable applicable Federal standards. Reviewing that comparison quantitatively answers whether the new standards are more or less protective than the Federal standards. That comparison of the newly adopted California standards to the comparable applicable Federal standards is conducted in light of prior waiver determinations. That is, the California-to-Federal analysis is undertaken within the broader context of the previously waived California program, which relies upon protectiveness determinations that EPA has not found arbitrary and capricious.[31]

A finding that California's determination was arbitrary and capricious under section 209(b)(1)(A) must be based upon '''clear and compelling evidence' to show that proposed [standards] undermine the protectiveness of California's standards.''[32] Even if EPA's own analysis of comparable protectiveness or that suggested by a commenter might diverge from California's protectiveness finding, that is not a sufficient basis on its own for EPA to make a section 209(b)(1)(A) finding that California's protectiveness finding is arbitrary and capricious.[33]

California made a protectiveness determination with regard to its greenhouse gas regulations in Resolution 04–28, adopted by the California Air Resources Board on September 23, 2004.[34] Included in that Resolution were several bases to support

[25] *Id.*

[26] *MEMA I,* 627 F.2d at 1121.

[27] *MEMA I,* 627 F.2d at 1110–11, citing H.R. Rep. No. 294, 95th Cong., 1st Sess. 301–02 (1977).

[28] *Federal Communications Commission* v. *Fox Television Stations, Inc.,* 129 S.Ct. 1800, 1809 (2009).

[29] In situations where there are no Federal standards directly comparable to the specific California standards under review, the analysis then occurs against the backdrop of previous waivers which determined that the California program was at least as protective of the federal program ((LEV II + ZEV) + GHG). See 71 FR 78190 (December 28, 2006), Decision Document for Waiver of Federal Preemption for California Zero Emission Vehicle (ZEV) Standards (December 21, 2006).

[30] 36 FR 17458 (Aug. 31, 1971). (''The law makes it clear that the waiver requests cannot be denied unless the specific finding designated in the statute can properly be made. The issue of whether a proposed California requirement is likely to result in only marginal improvement in air quality not commensurate with its cost or is otherwise an arguably unwise exercise of regulatory power is not legally pertinent to my decision under section 209, so long as the California requirement is consistent with section 202(a) and is more stringent than applicable Federal requirements in the sense that it may result in some further reduction in air pollution in California.''). The ''more stringent'' standard expressed here in 1971 was superseded by the 1977 amendments to section 209, which established that California's standards must be, in the aggregate, at least as protective of public health and welfare as applicable Federal standards. The stringency standard remains, though, in section 209(b)(2).

[31] In situations where there are no Federal standards directly comparable to the specific California standards under review, the analysis then occurs against the backdrop of previous waivers which determined that the California program was at least as protective of the federal program ((LEV II + ZEV) + GHG). See 71 FR 78190 (December 28, 2006), Decision Document for Waiver of Federal Preemption for California Zero Emission Vehicle (ZEV) Standards (December 21, 2006).

[32] *MEMA I,* 627 F.2d at 1122.

[33] ''Once California has come forward with a finding that the procedures it seeks to adopt will not undermine the protectiveness of its standards, parties opposing the waiver request must show that this finding is unreasonable.'' *MEMA I,* 627 F.2d at 1124.

[34] California Air Resources Board, EPA–HQ–OAR–2006–0173–0010.107, ''Resolution 04–28, State of California, Air Resources Board, September 23, 2004'' (''BE IT FURTHER RESOLVED that the Board hereby determines that the regulations approved herein will not cause California motor vehicle emission standards, in the aggregate, to be less protective of public health and welfare than applicable federal standards.'').

California's protectiveness determination. Most generally, CARB made a broad finding that observed and projected changes in California's climate are likely to have a significant adverse impact on public health and welfare in California, and that California is attempting to address those impacts by regulating in a field for which there are no comparable federal regulations.[35] CARB also found that its greenhouse gas standards will increase the health and welfare benefits from its broader motor vehicle emissions program by directly reducing upstream emissions of criteria pollutants from decreased fuel consumption.[36] Beyond that analysis of the new regulations' impact on its broader program, CARB projected consumer response to the greenhouse gas regulations. With respect to consumer shifts due to a potential ''scrappage effect'' (the impact of increased vehicle price on fleet age) and ''rebound effect'' (the impact of lower operating costs on vehicle miles travelled), CARB found minor impacts—but net reductions—on criteria pollutant emissions.[37] Further, even assuming larger shifts in consumer demand attributable to the greenhouse gas emission standards, CARB found that the result remains a net reduction in both greenhouse gas emissions and criteria pollutant emissions.[38] That is, CARB found that the addition of its greenhouse gas emission standards to its larger motor vehicle emissions program (LEV II), which generally aligns with the federal motor vehicle emissions program (Tier II), renders the whole program to be more protective of public health and welfare. CARB noted that EPA has already determined that California was not arbitrary and capricious in its determination that the pre-existing California standards for light-duty vehicles and trucks, known as LEV II, is at least as protective as comparable Federal standards, the Tier II standards.[39] Implicit in California's greenhouse gas protectiveness determination, then, is that the inclusion of greenhouse gas standards into California's existing motor vehicle emissions program will not cause California's program to be less protective than the federal program.

A. What Are ''Applicable Federal Standards''?

EPA has received comments suggesting that the section 209(b)(1)(A) comparison to ''applicable Federal standards'' should include corporate average fuel economy (CAFE) standards promulgated, or that in the future may be promulgated, by the National Highway Traffic Safety Administration under the Energy Policy and Conservation Act of 1975 (EPCA), as amended by the Energy Independence and Security Act of 2007 (EISA).[40] That suggestion departs from EPA's traditional analysis. EPA has always interpreted ''applicable Federal standards'' as limiting EPA's inquiry to motor vehicle emission standards established by EPA under the Clean Air Act. After a thorough examination of the text and legislative history of the section 209(b) waiver provision, EPA has determined that it should continue to interpret ''applicable Federal standards'' to mean motor vehicle emission standards established by EPA under the Clean Air Act that apply to the same cars and the same air pollutants or group of air pollutants as considered in California's aggregate protectiveness finding. Additionally, EPA has determined that even if it were appropriate to take NHTSA's fuel economy standards into account as ''applicable Federal standards,'' the waiver opponents have not met their burden of proof to demonstrate that California's protectiveness determination was arbitrary and capricious. No waiver opponent has demonstrated that existing or proposed fuel economy standards are more stringent or more protective of the public health and welfare than California's greenhouse gas emission standards.

1. Are ''Applicable Federal Standards'' Limited to Clean Air Act Emission Standards or Do They Include NHTSA's Fuel Economy Standards?

Section 209(b)(1)(A) requires EPA to evaluate whether California's determination regarding the comparative level of protectiveness of its standards of the public health and welfare was ''arbitrary and capricious.'' California's standards act to improve air quality, and thus benefit the public health and welfare, by establishing limits for emissions of air pollutants from new motor vehicles and new motor vehicle engines. California is then required to compare these new motor vehicle standards in the aggregate to ''applicable Federal standards'' to determine the relative protectiveness of California's standards. Depending on whether the waiver is granted or denied, vehicle manufacturers will either have to meet California standards for those new vehicles subject to its standards and EPA standards for others, or EPA standards for all of the new vehicles.

The most straightforward reading of the comparison called for by the statute, between California and Federal standards, is an ''apples to apples'' comparison. California has standards that apply to new motor vehicles and the standards set limits for emissions of air pollutants. California would then compare its standards to the same kind of Federal standard—Federal standards that apply to the same new motor vehicles and also set limits for emissions of air pollutants. The term ''applicable'' has to refer to what the Federal standards apply to, and the most straightforward meaning is that they apply in the same way that the

[35] California Air Resources Board, EPA–HQ–OAR–2006–0173–0010.107 at 9 (''Over the last hundred years, average temperatures in California have increased 0.7% F, sea levels have risen by three to eight inches, and spring run-off has decreased 12 percent. These observed and future changes are likely to have significant adverse effects on California's water resources, many ecological systems, as well as on human health and the economy. The signs of a global warming trend continue to become more evident and much of the scientific debate is now focused on expected rates at which future changes will occur.''); California Air Resources Board, EPA–HQ–OAR–2006–0173–0010.107 at 13 (''There are no comparable federal regulations that specifically require the control of greenhouse gas emissions from motor vehicles.'').

[36] ''The establishment of greenhouse gas emission standards will result in a reduction in upstream emissions (emission due to the production and transportation of the fuel used by the vehicle) of greenhouse gas, criteria and toxic pollutants due to reduced fuel usage.'' EPA–HQ–OAR–2006–0173–0010.107 at 8.

[37] ''Supplemental analysis of the potential response of consumers (consumer response) to the regulations was performed as part of the staff evaluation. The evaluation of consumer response indicates that the impact of vehicle price increases on fleet turnover (changes to the average age of the motor vehicle fleet) as well as the impacts of lower operating costs on vehicle miles traveled (rebound effect) by consumers have minor impacts (less than one percent of the passenger vehicle emissions inventory) on criteria pollutant emissions.'' EPA–HQ–OAR–2006–0173–0010.107 at 12.

[38] ''Taking into account the penetration of 2009 and later vehicles meeting the new standard, the proposed regulation will reduce greenhouse gas emission by an estimated 87,700 CO_2-equivelent tons per day statewide in 2020 and by 155,200 CO_2-equivelent tons per day in 2030. This translates into an 18 percent overall reduction in greenhouse gas emissions from the light duty fleet in 2020 and a 27 percent overall reduction in 2030; Taking into account the penetration of 2009 and later vehicles meeting the new standard, the proposed regulation will reduce upstream emissions of non-methane organic gases (NMOG) by 4.6 tons per day statewide in 2020 and 7.9 tons per day statewide in 2030, and will reduce upstream emissions of NO_X by 1.4 tons per day statewide in 2020 and 2.3 tons per day statewide in 2030. The regulation will provide a criteria pollutant benefit even taking into account possible pollutant increases due to consumer response.'' EPA–HQ–OAR–2006–0173–0010.107 at 15.

[39] 68 FR 19811 (April 22, 2003), Decision Document for Waiver of Federal Preemption for Low Emission Vehicle Amendments (LEV II) (April 11, 2003).

[40] Association of International Automobile Manufacturers, Inc., EPA–HQ–OAR–2006–1073–9005 at 13–14; Alliance of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–8994 at 16–23.

California standards apply, by setting limits on emissions of air pollutants from specified new motor vehicles. ''[A]pplicable Federal standards'' would be standards that impose a requirement on new motor vehicles and that directly establishes limits on emissions of air pollutants, as do the California standards. The ''applicable'' Federal standards are those set by EPA that directly apply by regulation to the same vehicles and, like the California regulations, set limits for the same air pollutants.

This is a straightforward and logical approach that provides clear guidance for California on what standards to compare. It avoids an open-ended inquiry into what other potential Federal standards might regulate different vehicles or regulate different aspects of the vehicles than emissions, and instead focuses the comparison on a clearly-defined and identifiable set of Federal standards that are parallel to the California standards at issue.

This interpretation also ties the comparison to the only Federal standards that are affected by the results of the comparison. If the California comparison shows it is more protective and the waiver is granted, the California standards would apply to the vehicles under section 209(b) and compliance with the California's standards will be deemed to mean compliance with the EPA standards under section 209(b)(3). If the California comparison is arbitrary and capricious and a waiver is denied, then EPA's Federal emission standards apply to those vehicles and California's standards do not. The applicability of emission standards under section 209(b) that results from the waiver decision is parallel to and fully consistent with the comparison made between the California and applicable Federal standards.

EPA has always limited its interpretation of the section 209(b) waiver provision to the scope of section 209(a)'s preemption.[41] Section 209(a) creates the explicit preemption of state emission standards, and at the same time leaves EPA to set federal emission standards, under the authority of section 202(a). Within the context of section 209, and the preemption of 209(a), section 209(b)'s waiver provision allows California the ability to set its own emission standards. Notably, section 209(b) merely gives back to California what was taken away by section 209(a)—the ability to adopt and enforce its own state emission standards. This interaction between sections 209(a) and 209(b) supports interpreting the ''applicable Federal standards'' mentioned in section 209(b)(1)(A) to mean the same types of emission standards as the emission standards that are actually set by California are preempted under section 209(a), and are the subject of a waiver request under section 209(b).

Additionally, EPA's construction of ''applicable Federal standards'' provides a single, consistent usage of that phrase in the context of the section 209(b) waiver provision. In section 209(b), the phrase ''applicable Federal standards'' appears three times. The first two instances appear in sections 209(b)(1) and 209(b)(2) and pertain to EPA's review of California's protectiveness determination and the relative stringency of California's standards, as has been discussed above. The third instance occurs in section 209(b)(3) and specifically contemplates treatment of waived California standards for the purpose of Clean Air Act compliance. Section 209(b)(3) states: ''in the case of any new motor vehicle or new motor vehicle engine to which State standards apply pursuant to a waiver granted under paragraph (1), compliance with such State standards shall be treated as compliance with applicable Federal standards *for purposes of this title.''* (Emphasis added) The reference to Title II of the Clean Air Act in section 209(b)(3) is further reason to limit the construction of ''applicable Federal standards'' to comparable Clean Air Act emission standards in sections 209(b)(1) and 209(b)(2). All three occurrences of ''applicable Federal standards'' in section 209(b) are then given the same meaning, in a context where all three occurrences function interactively to allow California to enforce its own emission standards.

The textual structure and legislative history of the waiver provision also support EPA's interpretation of ''applicable Federal standards.'' The structure of section 209(b) is notable in its focus on limiting the ability of EPA to deny a waiver and preserving ''the broadest possible discretion'' for California to construct its motor vehicle program as it deems appropriate to protect its public health and welfare.[42] Where, as in this case, California's emission standards are specified in terms of direct regulation of emissions from new motor vehicles, it is most clearly reasonable for EPA to limit its review under this criterion to those federal standards that likewise set limits for the same air pollutant emissions from the same motor vehicles. This is consistent with Congress' intent to provide California the broadest discretion and avoids limiting California's authority and frustrating this congressional intent.[43] EPA, thus, has determined it is reasonable to interpret ''applicable Federal standards'' to mean those EPA standards under the Clean Air Act that apply in the same manner as the California emission standards, regulating emissions of air pollutants from new motor vehicles.[44] Under this approach, any EPA standard that, like California's standards, sets limits for motor vehicle emissions could be considered an ''applicable Federal standard'' for the purpose of California's protectiveness determination.[45]

Applying this interpretation, Federal fuel economy standards issued by NHTSA would not be considered ''applicable Federal standards'' for purposes of this waiver criterion. In contrast to standards set limits for emissions from new motor vehicles, corporate average fuel economy (CAFE) standards set limits on fuel efficiency, to reduce fuel consumption. In contrast to EPA's and California's emission standards, which typically establish grams per mile (''gpm'') levels of acceptable pollutant emissions, CAFE standards establish ''miles per gallon'' (''mpg'') levels of acceptable fuel efficiency. Standards that set limits for emission levels and standards that set limits for fuel efficiency apply different legal requirements. The two kinds of standards can overlap significantly, in that the technology used to increase fuel efficiency will also lead to reductions in emissions of one of the GHGs—CO_2—

[41] ''The legislative history of section 209 supports the Administrator's interpretation that the waiver provision is coextensive with the preemption provision, thereby permitting the Administrator to consider waiving preemption of California's entire program of emissions control.'' *MEMA I,* 627 F.2d 1095, 1108.

[42] H.R. Rep. No. 294, 95th Cong., 1st Sess. 301–302 (1977); *MEMA I,* 627 F. 2d at 1110–11.

[43] *See MEMA I,* 627 F. 2d at 1111.

[44] *Entergy Corp.* v. *Riverkeeper, Inc.,* 129 S.Ct. 1498 (2009) (''That view governs if it is a reasonable interpretation of the statute—not necessarily the only possible interpretation, nor even the interpretation deemed *most* reasonable by the courts. *Chevron U.S.A. Inc.* v. *Natural Resources Defense Council, Inc.,* 467 U.S. 837, 8430844 (1984).'').

[45] In this waiver there are no EPA or other Federal standards that have been identified that explicitly and directly regulate emissions of GHGs from new motor vehicles. While emission standards promulgated by EPA have always been treated as applicable Federal standards because they explicitly regulate the same vehicles and air pollutants, there is the possibility that another Federal agency could have a standard that also directly and explicitly regulates emissions from some new motor vehicles. EPA is not aware of any such circumstances at this time, but reserves the right to consider in the future whether such a non-EPA Federal standard would be considered an ''applicable Federal standards'' for the purpose of a CAA waiver determination.

but they are not the same legal requirements and the regulations do not apply in the same manner.[46] Fuel economy standards do impact the levels of one GHG—CO_2—that is emitted from motor vehicles. But fuel economy standards do not set limits on emission levels of CO_2 or any other air pollutant, as do California's standards. Lacking that kind of regulation of emissions of an air pollutant, fuel economy standards are not ''applicable Federal standards.''

The difference between emission standards and fuel economy standards is highlighted by comparing the two sets of standards at issue here. California's greenhouse gas emission standards establish allowable grams per mile (''gpm'') levels for greenhouse gas emissions, including tailpipe emissions of carbon dioxide (CO_2), nitrous oxide (N_2O), and methane (CH_4) as well as emissions of CO_2 and hydrofluorocarbons (HFCs) related to operation of the air conditioning system. By regulating emissions of four different greenhouse gas pollutants, the standards do more than reduce tailpipe CO_2 emissions resulting from fuel combustion. They do not directly equate to miles per gallon fuel economy reductions. Fuel economy standards, on the other hand, directly control miles per gallon (''mpg'') fuel economy levels. CO_2 reductions will occur, but they are an expected indirect effect of improved fuel economy standards because the same technology that improves fuel economy effectively reduces CO_2 emissions.

There is no doubt that a CAFE standard would clearly produce companion reductions in CO_2 as fuel economy improves, given the technology used to improve fuel economy. However, for the reasons described above EPA believes the better interpretation of section 209(b)(1)(A) is to look at whether the Federal standard is applicable to the same vehicles and air pollutants as the California standards, by considering whether they directly regulate the same vehicles and air pollutants. It is clear that a CAFE standard does not meet this test. While there is a large but non-identical overlap in effect between a CAFE standard and a GHG emission standard with respect to emissions of CO_2, the CAFE standards do not set limits on emissions of CO_2 or any other GHG. There also remain important areas where there is no overlap at all with the California standards, including the regulation of greenhouse gas pollutants other than CO_2. Instead of making an exception to its interpretation of ''applicable Federal standards'' for NHTSA's CAFE fuel economy standards, EPA believes it is more appropriate to apply its traditional interpretation, for all of the reasons discussed above. Therefore, EPA has determined that NHTSA's CAFE standards are not ''applicable Federal standards'' for purposes of this waiver criterion.

2. If EPA Did Consider CAFE Standards as ''Applicable Federal Standards,'' Are the CAFE Standards More Stringent Than California's Greenhouse Gas Emission Standards?

Even if EPA were to take fuel economy standards into consideration as ''applicable Federal standards,'' opponents of the waiver have not met their burden of proof to demonstrate that California's protectiveness determination was arbitrary and capricious. No waiver opponent has demonstrated that existing CAFE standards are more stringent or more protective of the public health and welfare than California's greenhouse gas emission standards.

EPA has consistently stated in prior waiver determinations that California's protectiveness determination must consider the ''applicable Federal standards'' in existence at the time of EPA's waiver decision.[47] Standards in existence at the time of a waiver decision have only included finalized emission standards that EPA has promulgated through its rulemaking process and pursuant to its Clean Air Act authority.

Applying that approach here, if EPA were to take NHTSA's fuel economy standards into account when reviewing California's protectiveness determination, our inquiry would be limited to those final fuel economy standards that are currently in existence at the time of the waiver decision. Although NHTSA is required by the EISA to promulgate more stringent fuel economy standards in the future, the only final fuel economy standard under EISA that is currently in existence is that for the 2011 model year.[48] Additionally, although EPA and the Department of Transportation (DOT) have issued a notice of intent to engage in a joint rulemaking, with NHTSA issuing fuel economy standards under the EISA for the 2012 through 2016 model years and EPA issuing greenhouse gas standards under the CAA for those same model years, those standards are neither proposed nor final at this time.[49] To consider CAFE standards that have been proposed or those standards that may be proposed would be speculative about what standards will be adopted, and EPA has consistently found it inappropriate to engage in that speculation with respect to either EPA's or California's future standards in prior waiver decisions.

Further, it is reasonable to limit our consideration of ''applicable Federal standards'' to those final standards that are in existence, in light of the range of options that remain for California and EPA after a decision on this waiver. If federal greenhouse gas standards are promulgated in the future, and if such standards bring this determination into question, then EPA can revisit this decision at that time. The legislative history of section 209(b) makes clear that Congress considered section 209(b) as including the authority for EPA to withdraw a waiver if circumstances occur in the future that would make this appropriate: ''Implicit in this provision is the right of the [Administrator] to withdraw the waiver at any time [if] after notice and an opportunity for public hearing he finds that the State of California no longer complies with the conditions of the waiver.[50] EPA need not decide now what action might be authorized or appropriate under section 209(b) if EPA adopts greenhouse gas emission standards in the future, as that is best decided when EPA takes such action. Additionally, the possibility that CARB may revise its standards is always present. Such a revision would be considered by EPA in a future waiver proceeding. EPA would then determine whether those changes are within-the-scope of its prior waiver or if a new, full waiver determination would need to be made, as would be required if California

[46] The Supreme Court acknowledged this ''overlap'' between fuel economy and emission standards in *Massachusetts* v. *EPA,* 127 S. Ct. at 1438. (''[T]hat DOT sets mileage standards in no way licenses EPA to shirk its environmental responsibilities. EPA has been charged with protecting the public's 'health' and 'welfare.' 42 U.S.C. 7521(a)(1), a statutory obligation wholly independent of DOT's mandate to promote energy efficiency. *See* Energy Policy and Conservation Act, section 2(5), 89 Stat. 874, 42 U.S.C. 6201(5). The two obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.'')

[47] See *e.g.,* Authorization of California's Under 25 Horsepower Utility Lawn and Garden Equipment Engine Exhaust Emission Standards (ULGE) (July 5, 1995) at 18. (''CARB's protectiveness determination must be judged on the standards that are in existence at the time EPA makes it authorization determination. However, as CARB correctly states, until EPA's rules become final no changed circumstances exist that affect CARB's protectiveness determination, and that it would be premature to make a protectiveness comparison with non-finalized federal standards.'')

[48] 74 FR 14196 (March 30, 2009).

[49] 74 FR 24007 (May 22, 2009).

[50] S. Rep. No. 403, 90th Cong. 1st Sess. (1967), at 33–34.

decided to increase the stringency of its greenhouse gas standards.

California's greenhouse gas emission standards begin with the 2009 model year and increase in stringency through the 2016 model year. For that same time period, fuel economy standards only exist for the 2009 through 2011 model years. An appropriate comparison between California's greenhouse gas standards and NHTSA's fuel economy standards, then, would compare California's standards for the 2009 and later model years to NHTSA's fuel economy standards for the 2009 through 2011 model years.

In his December 19, 2007 letter notifying California Governor Schwarzenegger that California's waiver request would be denied, former EPA Administrator Johnson stated that the EISA ''establishes an aggressive standard of 35 miles per gallon for all 50 states, as opposed to the 33.8 miles per gallon in California and a patchwork of other states.'' California prepared and documented a technical evaluation comparing federal fuel economy standards to its own standards.[51] Accounting for the differences between the two sets of standards, CARB attempted an ''apples to apples'' comparison of the standards and made several assumptions to that end. For its own standards, CARB assumed its current greenhouse gas regulations—at issue here—were in effect for the 2009 through 2016 model years and that those standards increased in stringency for the 2016 through 2020 model years (its ''Pavley 2'' standards that are not at issue in this waiver proceeding). Because EISA does not set standards, but directs NHTSA to issue standards that increase fuel economy to a minimum of 35 miles per gallon by the 2020 model year, CARB projected that the new CAFE standards would proportionally increase by 3.44 percent each year after the 2011 model year. Also, because EISA allows a fuel economy credit up to 1.2 miles per gallon for use of flexible fuel vehicles (FFVs) that can operate on high-blend ethanol, such as E85, based on manufacturer statements that they would produce large numbers of FFVs, CARB assumed maximum use of that credit. CARB also took into account differences in fleet mix in California and the other 49 states. To compare this range of years of the California greenhouse gas emission standards to the corresponding range of years of EISA fuel economy standards, CARB translated the miles per gallon standards from EISA into greenhouse gas emission rates. The rates of greenhouse gas emission reduction from each set of standards were then compared from 2009 through 2020.[52] CARB found that in California in 2016, its greenhouse gas emission standards would achieve 51.9 million metric tons of greenhouse gas emission reductions compared to 23.7 million metric tons from federal fuel economy standards. By 2020, CARB found 100.5 million metric tons of greenhouse gas emission reductions from its standards compared to 59.5 million metric tons of greenhouse gas emission reductions from the federal fuel economy standards.[53] Both sets of reductions follow a similar pattern because both sets of standards are relatively similar in stringency in the near-term (2009–2011), with California's standards ramping up in the mid-term (2012–2016), just as the proposed EISA standards begin to increase their stringency. While both sets of standards gain stringency in the long-term (2016 and beyond), California found that its standards are more stringent sooner and in the long-term and, furthermore, that its standards are more protective of its public health and welfare because they achieve greater greenhouse gas reductions.

EPA notes that this comparison requires speculation regarding what final CAFE standards will be promulgated by NHTSA for the 2012–2020 model years, and what final GHG standards may be promulgated by CARB for the 2017–2020 model years. If the comparison were truly between final, promulgated standards of California GHG-to-CAFE, it would compare California standards for the 2009 through 2016 model years to the lone NHTSA fuel economy standard for the 2011 model year, and the preexisting standards for the 2009–2010 model years. This highlights that the appropriate approach is to compare standards that are final as of the time of the waiver decision. However, California's approach indicates that its standards are more stringent than federal CAFE standards even if CAFE standards increased in the 2012 through 2016 model years. Therefore, this approach also would indicate that California's standards, reviewing only those standards that are final at this time, are more stringent in the aggregate.

No commenter has presented evidence that questions CARB's claim that its greenhouse gas emission standards are more stringent than EISA. Most commenters opposing the waiver do not focus on the comparative stringency of the two sets of standards, but instead focus on EISA's mandate for more stringent fuel economy standards as undermining the currency of California's protectiveness determination or California's ''need'' for its greenhouse gas emission standards. For example, AIAM has argued that the increased stringency of CAFE standards due to the EISA removes the basis for California's protectiveness determination.[54] Similarly, the Alliance argues that ''CARB erred in a fundamental way when it chose to ignore the impact of the federal CAFE standards generally and EISA's passage in specific on California's outdated protectiveness determination.'' [55] These arguments assume that CAFE standards are ''applicable Federal standards'' and that non-final standards may be taken into consideration at the time of a waiver determination. As explained in detail above, those assumptions are not consistent with EPA's interpretation of the section 209(b)(1)(A) criterion. Notably though, neither argument presents a factually-based analysis of the stringency of California's greenhouse gas emission standards as compared to existing fuel economy standards that undermines California's protectiveness determination.[56] Such an

[51] California Air Resources Board, Comparison of Greenhouse Gas Reductions for the United States and Canada under U.S. CAFE Standards and California Air Resources Board Greenhouse Gas Regulations, February 25, 2008, available at *http://www.arb.ca.gov/cc/ccms/reports/pavleycafe_reportfeb25_08.pdf.*

[52] The 2009 through 2020 model year standards are not a straightforward comparison of California's greenhouse gas standards to EISA standards because the years do not align. The California greenhouse gas standards at issue, here, are for the 2009 and later model years, whereas EISA was enacted in 2007 and mandates standards to reach 35 miles per gallon by the 2020 mode year, but as of yet have only been promulgated for the 2011 model year. The 2009 and 2010 MY federal fuel economy standards were pre-EISA standards. Neither California nor NHTSA has yet promulgated standards for the 2017–2020 model years: California greenhouse gas standards for those years are currently proposed in California (as ''Pavley 2'' standards), as are all the EISA standards from the 2012 through 2015 model years.

[53] California Air Resources Board, Comparison of Greenhouse Gas Reductions for the United States and Canada under U.S. CAFE Standards and California Air Resources Board Greenhouse Gas Regulations, (February 25, 2008), at 13–14.

[54] Association of International Automobile Manufacturers, Inc., EPA–HQ–OAR–2006–0173–9005 at 13–14.

[55] Alliance of Automobile Manufacturers, EPA, HQ–OAR–2006–0173–8994 at 20.

[56] The Alliance's comments received April 6, 2009 state: ''It should be noted that * * * it is also true that the fuel economy improvements required by the California GHG standards are more stringent, overall, for the industry than the CAFE standards in many jurisdictions in which the state GHG standards would apply compared to the CAFE standards. CARB does not disagree with this point. See CARB, Comparison of Greenhouse Gas Reductions for the United States and Canada Under U.S. CAFE Standards and California's Air Resources

Continued

analysis would be necessary for EPA to make a section 209(b)(1)(A) finding, if EPA were to depart from its traditional review of California's protectiveness determination and interpret ''applicable Federal standards'' to include NHTSA's fuel economy standards. As noted below, the Alliance points to an analysis of the relative stringency of the two sets of standards to find that: ''the combined vehicle-fuel program created by the EISA would result in greater life-cycle GHG reductions than the state standards that are the subject of this proceeding by the end of the decade.'' That analysis, however, is flawed for the purpose of this waiver consideration because it speculates as to NHTSA standards that are not yet finalized, or even proposed. Additionally, it infers that California's standards are more protective until 2017.[57]

Based on the above, and recognizing that federal fuel economy standards are not ''applicable Federal standards,'' EPA notes that even if the stringency of CAFE standards are considered in context of the section 209(b)(1)(A) waiver criterion, the opponents of the waiver have not presented sufficient evidence to show that California's protectiveness determination is arbitrary and capricious. No commenter has shown that California's determination was arbitrary and capricious in finding that NHTSA's fuel economy standards are not in the aggregate more protective of human health and welfare than California's greenhouse gas standards, whether one considers just the CARB and NHTSA standards that are currently finalized, or one considers possible future standards that either agency might adopt.

B. How Does EPA Evaluate Impacts on Other States?

Several comments have suggested that EPA should consider the impacts of California's greenhouse gas standards on other states.[58] At present time, thirteen other states and the District of Columbia have already adopted California's greenhouse gas emission standards pursuant to section 177 of the Act.[59] These comments raise two objections concerning other states adoption of California's greenhouse gas emission standards. First, these comments suggest that state-by-state compliance with each state's adopted set of California standards presents an unworkable compliance ''patchwork'' for automobile manufacturers.[60] Second, and related, the comments suggest that enforcement of California's greenhouse gas standards in other states will lead to ''environmental disbenefits'' in those states.[61] EPA takes no position on the merits of either argument because these arguments are outside the scope of our section 209(b)(1) waiver criteria. EPA's evaluation of California's waiver request is limited to the State of California.[62] To the extent that these comments raise issues regarding the environmental impacts of consumer shifts within California they are evaluated below.

C. Is California's Protectiveness Determination Arbitrary and Capricious?

1. Based on EPA's Traditional Analysis, Is California's Protectiveness Determination Arbitrary and Capricious?

As described above, EPA's traditional analysis has been to evaluate California's protectiveness determination by comparing the new California standards to applicable EPA emission standards for the same pollutants.[63] In the context of greenhouse gas emissions this analysis is simple. EPA has already determined that California was not arbitrary and capricious in its determination that the pre-existing California standards for light-duty vehicles and trucks, known as LEV II, is at least as protective as comparable Federal standards, known as the Tier II standards.[64] In the context of the ZEV proceeding, EPA conducted its traditional analysis to compare California's newly enacted ZEV standards to a similar lack of applicable Federal standards. At that time, California found, and EPA deemed reasonable, that the addition of the ZEV standards did not render California's LEV II program, for which a waiver had previously been granted, less protective than the Federal Tier II program. In addressing the Alliance's petition for reconsideration with respect to this issue, EPA stated that ''the words 'standards' and 'in the aggregate' in section 209(b)(1)(A) * * * . at minimum, include all the standards relating to the control of emissions for a category of vehicles (*e.g.* passenger cars, etc.) subject to CARB regulation, particularly where the standards are designed to respond to the same type of pollution.'' [65]

California's greenhouse gas standards are also an addition to its existing LEV II program. Since the greenhouse gas standards add onto California standards that have already been determined to be as least as protective, and since there are no applicable federal greenhouse gas emission standards, the point of comparison, here, is between California's greenhouse gas standards and an absence of EPA greenhouse gas emission standards. Comparing an absence of EPA greenhouse gas emission standards to the enacted set of California greenhouse gas emission standards provides a clearly rational basis for California's determination that the California greenhouse gas emission program will be more protective of human health and welfare than non-existent applicable federal standards. California directly addressed this traditional analysis in its finding that ''[t]here are no comparable federal regulations that specifically require the control of greenhouse gas emissions from motor vehicles.'' [66]

EPA received comments suggesting that this type of traditional comparison is inappropriate, even ''impossible,'' in

Board Greenhouse Gas Regulations: An Enhanced Assessment, at 8 (February 25, 2008).'' Alliance of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–8994 at 20, note 4.

[66] Id. at 13.

the absence of Federal greenhouse gas emission standards.[67] Such an argument is contrary to legislative intent and EPA's practice.[68] This is not the first time that California has enacted emission standards in the absence of Federal standards; in fact, California's pioneering role in setting mobile source emission standards is one reason the waiver provision exists.[69] Given that section 209(b)(1) is designed to allow California to have standards more stringent than Federal standards, it would make little sense to use this provision to prevent California from having such standards where the Federal government has not yet acted. Moreover, in prior decisions EPA has found that such protectiveness determinations by California in the absence of Federal standards were reasonable.[70] Indeed, California standards may be most clearly ''at least as protective'' when they are compared to the absence of Federal emission standards. This commenter further points to the ''tremendous level of current federal activity'' as the primary reason why ''it is impossible for EPA to evaluate how the GHG Regulations will compare with federal regulation in this field.'' While EPA has announced its intention to propose greenhouse gas emission standards, EPA has consistently stated that CARB's protectiveness determination must consider the Federal standards in existence at the time of EPA's waiver decision.[71]

Furthermore, waiting for future federal regulation would be contrary to the purpose of the section 209(b) waiver provision—effectively stalling California's ability to enforce its own program. CARB's protectiveness determination was made on September 23, 2004, at which time there were no federal greenhouse gas standards. CARB's determination, then, correctly compared its standards to the absence of federal emission standards. Since that time, there has been no relevant intervening ''applicable Federal standard.'' [72] Although AIAM points to the *Massachusetts* v. *EPA* decision and Executive Order 13,432, neither of those documents, nor any subsequent actions by the Federal government,[73] constitute final EPA regulation of greenhouse gas emissions for new motor vehicles that could be used as a comparable standard in this waiver proceeding.[74] The current lack of federal greenhouse gas emission standards maintains the factual basis for CARB's September 23, 2004 protectiveness determination. As noted above, if and when greenhouse gas standards are promulgated by EPA in the future, and if such standards bring this determination into question, then EPA can revisit this waiver decision at that time. Accordingly, applying its traditional comparative analysis, opponents of the waiver have not shown flaw or lack of reason in California's protectiveness determination; and we cannot find that California's protectiveness determination is arbitrary and capricious.

2. Is California's Protectiveness Determination Arbitrary and Capricious Based on the Real-World In-Use Effects of California's Greenhouse Gas Standards?

EPA received comments suggesting the need for and appropriateness of applying an alternative interpretation of section 209(b)(1)(A), based on an inquiry into the in-use effect of inclusion of greenhouse gas standards upon the broader motor vehicle emissions program.[75] EPA does not take a position as to the validity of the suggestion that the type of numerical analysis discussed above is insufficient. Noting the legislative history and text of section 209(b)(2), EPA would need a concrete factual basis to examine the in-use effect of California's greenhouse gas standards on its broader LEV II program as compared to the Federal Tier II program. We need not take a position on that matter because to the extent that the in-use effects of the greenhouse gas standards are considered, the waiver opponents do not meet their burden to show that CARB's analysis of the effects is unreasonable.

These comments suggest that consumer effects will cause California's broader LEV II motor vehicle emissions program to be less protective than the Federal Tier II emissions program.[76] In support of this analysis, the Alliance commissioned a study from Sierra Research, NERA Economic Consulting, and Air Improvement Resource, Inc. entitled ''Effectiveness of the California Light Duty Vehicle Regulations as Compared to Federal Regulations,'' which was submitted to EPA on June 15, 2007 (''June 2007 AIR/NERA/Sierra Study'').[77] CARB specifically responded to the June 2007 Study in comments it submitted to the docket on July 24, 2007 (''CARB's July Comments'').[78] Next, the Alliance submitted a response to California's response prepared by NERA Economic Consulting and Sierra Research (''October 2007 NERA/Sierra Study'').[79] Most recently, the Alliance submitted another study produced by NERA Economic Consulting and Sierra Research entitled ''Impacts of the California Greenhouse Gas Emission Standards on Motor Vehicle Sales'' (''April 2009 NERA/Sierra Study'').[80] On this issue, the Alliance also refers to a study published by the Society of Automotive Engineers entitled ''Evaluation of California Greenhouse Gas Standards and Federal Independence and Security Act—Part 2: CO_2 and GHG Impacts'' (''SAE Study'').[81] At the same time, Air Improvement Resource, Inc. has independently submitted comments which include its ''Evaluation of California Greenhouse Gas Standards and Federal Energy Independence and Security Act'' (''March 2009 AIR Study'').[82]

The Alliance has raised this issue before, in its request for reconsideration of EPA's waiver for California's ZEV

[67] Alliance of International Automobile Manufacturers, EPA–HQ–OAR–2006–0173–1455 at 3; Alliance of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–1297 at 2, 5–7, 11–12; National Automobile Dealers Association, EPA–HQ–OAR–0173–1671 at 3.

[68] The waiver provision allows California to ''act as a testing agent for various types of control and the country as a whole will be a beneficiary of this research'' (113 Cong. Rec. 32478 [1967]); ''act as a laboratory for innovation'' (*MEMA I* at 1095). *See* Decision Document for Authorization of State Standards for Utility Lawn and Garden Equipment (ULGE) (July 5, 1995).

[69] California first began regulating motor vehicle emissions in 1957, nearly a decade before Congress enacted the Motor Vehicle Air Pollution Control Act of 1965, which enabled a federal program.

standards.[83] In that reconsideration, the Alliance referred to the same June 2007 AIR/NERA/Sierra Study, saying that the California program, as a whole, was not at least as protective of public health and welfare as comparable federal standards. EPA denied the Alliance's request, in particular because the June 2007 AIR/NERA/Sierra Study was produced under the assumption that California's ZEV standards would be in effect until at least 2020 and that California's greenhouse gas standards would also be in effect. As EPA had only granted the ZEV waiver through the 2011 model year and had not granted the greenhouse gas waiver, EPA found that the study was not based upon the proper assumptions for comparing California's standards to federal standards. EPA stated at that time: ''[T]o the extent that the real-world emission effects of CARB's ZEV program (aggregated with its LEV II standards) are relevant, if at all, the Alliance fails to submit sufficiently focused information regarding these programs and their associated effect on emissions. Thus, no basis exists to reconsider EPA's December 2006 waiver decision based on the NERA/Sierra/Air report.'' [84]

In evaluating its greenhouse gas standards, California's protectiveness determination went beyond a simple numerical comparison of its greenhouse gas standards to non-existent federal greenhouse gas standards. Its protectiveness determination was also based upon its own analysis of the impact of its greenhouse gas standards on its larger program. California found that its new greenhouse gas standards would yield not only reductions in greenhouse gas emissions but also a net reduction in criteria pollutant emissions.[85] Therefore, to the extent this analysis is even relevant for an EPA waiver review opponents must present ''clear and compelling'' evidence challenging the reasonableness of this determination and California's analysis.

The June 2007 AIR/NERA/Sierra Study prepared for the Alliance presents a finding that its results ''indicate that the California Program, in the aggregate, is less protective of public health than the Federal Program with respect to emissions of ozone precursors and several other criteria pollutants.'' The study undertook consumer choice modeling to evaluate the effect of the California greenhouse gas emission standards on the new motor vehicle fleet and vehicle miles travelled (VMT) and compare those effects with fleet and VMT conditions were the Federal Program in effect in California. Its results showed that compliance with the California greenhouse gas standards would raise the cost of new motor vehicles in California, which would then lead to higher new vehicle prices, decreased new vehicle sales, increased retention of used vehicles (''scrappage effect''), increased fuel economy which would lead to increased VMT (''rebound effect''), and, finally, increased emissions of ozone precursors and several other criteria air pollutants.

On July 24, 2007, CARB submitted a response to comments received by EPA which specifically addressed the June 2007 AIR/NERA/Sierra Study.[86] First, CARB insisted that such a study should have been presented for consideration during California's rulemaking process and not later during EPA's consideration of California's waiver request. Second, CARB substantively responded to the June 2007 AIR/NERA/Sierra Study and claimed that its protectiveness determination was proper. In sum, CARB objected that the June 2007 AIR/NERA/Sierra Study is inappropriate because it is not focused on the relative stringency of emission standards, but instead presents ''a series of speculative events driven by disputed and unsupported compliance costs that would supposedly result—contrary to experience with previous reduction and automotive regulatory measures—in a substantial reduction in new motor vehicle sales (fleet turnover); and * * * Californians' theoretical desire to drive even more miles than already projected to reach increasingly distant destinations in the face of increasing traffic congestion (rebound effect).'' [87] CARB further critiqued several points of AIR/NERA/Sierra's analysis, including what it viewed as ''grossly overstated * * * highly speculative cost estimates,'' modeling errors, lack of methodological detail, and faulty assumptions. CARB asserted that its staff reviewed similar analyses and had provided its own analyses that are ''more reasonable and historically reliable'' and ''lead to dramatically different outputs.''

NERA/Sierra responded to that critique on October 29, 2007.[88] That document includes specific responses to criticisms raised by CARB and generally defends the integrity of its analyses. NERA/Sierra affirmed its conclusions that CARB's protectiveness determination is not fully supported because it understates or ignores costs, does not consider the combined effects of the ZEV mandate and GHG requirements, and does not assure compliance through technological implementation. As to the specific modeling issues raised by CARB, NERA/Sierra maintained the correctness of its modeling assumptions and estimations with regard to technology cost, fleet turnover, rebound effect, and pollutant emission effect.

NERA/Sierra also submitted an additional study on April 6, 2009, presenting many of the same methodological assertions noted above. Notably, though, this study is less methodologically clear: It does not quantify scrappage or its effects on emissions, assumes technology is applied only to meet federal CAFE

[83] Decision Document for Waiver of Federal Preemption for California Zero Emission Vehicle (ZEV) Standards (December 21, 2006) and EPA's August 13, 2008 Response to Petition for Administrative Reconsideration of EPA's ZEV Waiver Decision (through the 2011 Model Year) published on December 28, 2006.

[84] EPA's August 13, 2008 Response to Petition for Administrative Reconsideration of EPA's ZEV Waiver Decision (through the 2011 Model Year) published on December 28, 2006, at 17–18. That denial further opined: ''In light of the language of section 209(b)(1)(A) and associated legislative history, it may only be necessary to examine the applicable emission limits in determining California's ability to set more stringent standards and pursue pioneering efforts (which may or may not lead to higher costs and associated fleet turnover concerns) under section 209(b)(1)(A). Given the legislative history * * *. EPA would need a concrete basis to examine the ''real world'' or in-use effect of California's standards in comparison to applicable federal standards (in this case, a comparison of LEV II + ZEV versus Tier 2). To require CARB to justify its standards and policy goals within the context of the protectiveness criteria based on waiver opponents' complicated and controversial models that apply assumptions that are themselves controversial, and where there are no corresponding federal standards, raises questions about whether demanding this type of review conflicts with Congress' intent to allow California 'the broadest possible discretion' in fashioning its own motor vehicle program without EPA second-guessing California's policy choices.'' Id. at 12.

[85] California Air Resources Board, EPA–HQ–OAR–2006–0173–0010.107 at 15 (''Taking into account the penetration of 2009 and later vehicles meeting the new standard, the proposed regulation will reduce greenhouse gas emission by an estimated 87,700 CO_2-equivelent tons per day statewide in 2020 and by 155,200 CO_2-equivelent tons per day in 2030. This translates into an 18 percent overall reduction in greenhouse gas emissions from the light duty fleet in 2020 and a 27 percent overall reduction in 2030; Taking into account the penetration of 2009 and later vehicles meeting the new standard, the proposed regulation will reduce upstream emissions of non-methane organic gases (NMOG) by 4.6 tons per day statewide in 2020 and 7.9 tons per day statewide in 2030, and will reduce upstream emissions of NO_X by 1.4 tons per day statewide in 2020 and 2.3 tons per day statewide in 2030. The regulation will provide a criteria pollutant benefit even taking into account possible pollutant increases due to consumer response.'').

[86] California Air Resources Board, EPA–HQ–OAR–2006–0173–3601.

[87] California Air Resources Board, EPA–HQ–OAR–2006–0173–3601 at 8.

[88] NERA Economic Consulting, Inc. and Sierra Research, EPA–HQ–OAR–2006–0173–3651.

standards (and not beyond that level of stringency), and assumes that further compliance is achieved through fleet mix changes combined with restrictions on vehicle availability. It is not clear whether and how ZEV program requirements are included in this study. Most importantly, though, the April 2009 NERA/Sierra Study is outside the scope of this proceeding; it presents ''the effects on motor vehicle sales of the California Standards, assuming that they are implemented in the 13 states that have adopted California's standards.'' [89] That is, the April 2009 NERA/Sierra Study seeks to present the effect of California's greenhouse gas standards on new motor vehicle sales in those 13 states. This is inappropriate because the waiver inquiry is limited to the State of California (as noted above) and, even if this study had been limited to California, it would still be inadequate because it does not connect its findings with regard to depressed vehicle sales to increased criteria pollutant emissions.

Air Improvement Resources, Inc. (''AIR''), who had originally participated in the June 2007 AIR/NERA/Sierra Study but submitted comment independently on April 6, 2009, evaluated California's greenhouse gas standards as compared to EISA ''standards.'' As noted above, this evaluation is not relevant to EPA's section 209(b)(1)(A) inquiry because EISA ''standards'' are not ''applicable Federal standards'' for the purpose of our waiver inquiry. Nor have any fuel economy standards been promulgated beyond the 2011 model year. Those underlying inadequacies render this study unpersuasive, if not entirely irrelevant. However, it is interesting to note that the primary finding of this study is that ''the California program has lower GHG emissions until about 2016–2018.'' [90] AIR also included as an attachment an SAE Paper evaluating impacts on new vehicle fuel economy from California's greenhouse gas standards and EISA ''standards.'' The finding of this paper is that California's greenhouse gas standards will lead to higher fuel economy than EISA ''standards'' until the 2017 model year.[91] The findings of both reports are based on inconsistent assumptions that California's greenhouse gas standards will not become more stringent after the 2016 model year, (because this waiver request ends with the 2016 model year standards) but the federal fuel economy standards will become more stringent even though there are not yet any federal fuel economy standards past the 2011 model year. As stated above, EPA is not including fuel economy standards in its consideration of ''applicable Federal standards.'' But, even if EPA were to engage in that analysis, it can only consider standards in existence at the time of a waiver decision, as stated above. Since no federal fuel economy standards exist yet beyond the 2011 model year, EPA will not make predictions about later year fuel economy standards in order to take them into account here.

As discussed below, EPA has evaluated both sets of analyses (from CARB and NERA/Sierra) and makes note of the following with regard to (1) fleet turnover/delayed scrappage, (2) the rebound effect, and (3) upstream emissions impacts.[92]

a. Fleet Turnover/Delayed Scrappage

The Alliance argues that California's greenhouse gas standards will cause delayed fleet turnover and, thus, increase criteria air pollutant emissions. Delayed fleet turnover results when the prices of new vehicles increase, causing prices of existing vehicles to increase as well. A consumer's decision to scrap an existing vehicle depends upon the trade-off between the value of existing vehicle in its working condition and its scrappage value. Rising prices of existing vehicles lead some consumers to decide to delay scrapping their vehicles. An older vehicle stock on the road results in an increase in criteria air pollution.

In conducting its analysis on consumer behavior impacts in its June 2007 study, NERA/Sierra/AIR evaluated the combined impacts of the California greenhouse gas emission standards and the Zero Emission Vehicle (''ZEV'') rules. It is difficult to discern the total cost per vehicle over various model years of the greenhouse gas versus the ZEV portion of the rules and, therefore, determine how much of the consumer behavior impacts are appropriately attributable to the greenhouse gas standards. Thus, it is difficult to undertake a direct comparison of the NERA/Sierra/Air and CARB studies. According to NERA/Sierra/AIR, as a result of price increases associated with the greenhouse gas and ZEV rules in 2020, they project that new vehicle sales in California will fall by approximately 130,000 vehicles. In addition, the number of vehicles in the fleet prior to the effective date of the ZEV and GHG regulations (*i.e.,* pre-2009 model year vehicles) is more than 250,000 greater in 2020 than would otherwise be the case under a federal program.

CARB, on the other hand, only looks at the economic impacts of the California greenhouse gas standards, independent of the ZEV requirements. Without the ZEV requirements, CARB estimates that California's greenhouse gas standards will result in an increase in new vehicle prices of approximately $1,000 per vehicle (*i.e.,* $1,064 for passenger vehicles, small trucks and sport utility vehicles (SUVs) and $1,029 for certain medium-duty trucks/SUVs).[93] Using a consumer choice model, CARBITS, CARB estimated new vehicle sales from California standards would increase in the near-term, resulting in accelerated fleet turnover, but see declines in fleet turnover in the longer-term, with a loss of vehicle sales of roughly 97,000 in 2020. By 2020, CARB estimates that lost vehicle sales would lead to delayed fleet turnover. The potential increase in ozone precursor emission in California in out years (*i.e.,* 2020) from delayed fleet turnover is about 2.5 tons/day. CARB estimates that those ''disbenefits'' of fleet turnover delay are more than offset by faster turnover in the early years of the California standard and reductions in emissions associated with fuel production. The more recent April 2009 NERA/Sierra study projects the impacts of the California GHG standards on new motor vehicle sales in the thirteen states that have adopted the California standards. Since the study only examines the impacts on new vehicle sales, it does not provide estimates of ozone precursor impacts of California standards.

b. The ''Rebound Effect''

The Alliance contends that criteria air pollutant emissions will increase due to

[89] NERA Economic Consulting and Sierra Research, EPA–HQ–OAR–2006–0173–9053 at E–1.

[90] Air Improvement Resources, Inc., EPA–HQ–OAR–2006–0173–13662 at 2. Yet this analysis presumes the promulgation of fuel economy standards that have not yet been promulgated and does not accordingly presume the promulgation of further greenhouse gas standards by California, despite the fact that the Pavley law in California makes such further standards a significant possibility.

[91] Air Improvement Resources, Inc., EPA–HQ–OAR–2006–0173–13662.

[92] EPA's role in reviewing California's waiver request is limited to finding whether opponents have shown that California's protectiveness determination is arbitrary and capricious. In making its protectiveness determination, CARB included these analyses and the studies noted above have included similar analyses based on diverging assumptions. EPA has evaluated these analyses to demonstrate that CARB's protectiveness determination was not arbitrary and capricious. This evaluation is separate and distinct from any analysis that EPA would conduct in promulgating its own regulation. Nothing in this evaluation should be construed as an endorsement of CARB's or any other analysis or any particular assumption they rely upon.

[93] California Air Resources Board, EPA–HQ–OAR–2006–0173.0010.116.

the so-called vehicle ''rebound effect.'' The rebound effect for vehicle fuel economy is defined as the increase in vehicle travel resulting from a decrease in the fuel cost per vehicle miles as a consequence of an increase in fuel economy. It is projected that increasing fuel efficiency lowers the effective cost of driving to the consumer, which results in an increase in vehicle usage (holding all other factors constant). NERA developed their own econometric estimate of the California rebound effect—17%—based on California vehicle inspection data from 1983–2003. In addition, NERA re-estimated a CARB-sponsored study on the rebound effect by Small & Van Dender and NERA found the long-run rebound effect in California to be roughly 13%.

In contrast, CARB used two types of analysis to evaluate the impact of the proposed regulations on changes in vehicle miles traveled: Econometric work by Small and Van Dender and travel demand modeling (Southern California Association of Governor's (SCAG)). The study by Small & Van Dender allowed the rebound effect to vary based on changes in income and congestion. In addition, the Small & Van Dender study also analyzed the impact of higher vehicle costs on VMT. Based on the econometric modeling, projected California incomes and transportation conditions, Small and Van Dender estimated a dynamic rebound effect of approximately 3% for the State of California in 2020. A major difference between the NERA and Small and Van Dender study was the way nominal income was converted to real income. NERA tried to approximate state cost of living adjustments, but had to modify metropolitan cost of living adjustments; Small and Van Dender used the national consumer price index. Based on the difference in income calculation, NERA found that income was no longer statistically significant in explaining changes in the rebound effect. Therefore, they removed this term from their model. California also used the Southern California Association of Governor's (SCAG) travel demand model to project changes in demand travel based on declining vehicle operating costs in the context of the transportation system in the L.A. South Coast Air Basin. In contrast to the econometric study, the travel demand modeling takes into account the available transportation infrastructure. CARB examined the emission impacts of changes in both the amount and the speed of motor vehicle travel, relative to the cost of gasoline per mile traveled. Based on the vehicle classes affected by the proposed GHG regulation, the results from SCAG indicate an elasticity of VMT to fuel cost (*i.e.,* a rebound effect) of roughly 4 percent in 2020.

c. Upstream Emissions Impacts

California's greenhouse gas standards also will influence the amount of fuel going through the petroleum marketing and distribution infrastructure in California. This, in turn, will reduce the ''upstream'' criteria air pollutants from transportation, spills, and other events associated with the infrastructure. There were large differences between the CARB and NERA/Sierra estimates of upstream emissions. NERA, focusing on fuel delivery trucks and transit distances, characterized CARB's estimates as significantly flawed. However, both estimated upstream emission reductions of ROG and NO_X, with CARB estimating a 6 ton per day reduction and NERA estimating a 1.1–1.5 ton per day reduction. The table below presents the rivaling estimates presented by the CARB and NERA/Sierra analyses.

	CARB	NERA
Fleet Turnover/Scrappage Effect.	Accelerated fleet turnover in near-term; smaller delayed fleet turnover in out years (*e.g.,* 2020).	Delayed fleet turnover in near term; larger delayed fleet turnover in out years (*e.g.,* 2020).
Rebound Effect	3% in 2020	17% in 2003, 13% in 2007.
Upstream Emissions	6 tons/day reduction in ROG+NOx	1.1–1.5 tons/day reduction in ROG+NOx.

Additionally, as with our analysis of the AIR/NERA/Sierra analysis in the context of the ZEV waiver reconsideration, we note that the study included a presumption that the ZEV standards would be in effect until at least 2020, and that this assumption appears to have a significant effect on other assumptions in the analysis. However, EPA explicitly declined to approve its waiver for California's ZEV standards beyond the 2011 model year, based in part on concerns that echoed comments from the Alliance. This makes the AIR/NERA/Sierra analysis an insufficient analysis to base a denial of California's waiver request.

In evaluating the studies prepared by AIR/NERA/Sierra in light of California's protectiveness determination, EPA takes important note of CARB's response. As stated above, while CARB disagrees that these studies are properly before EPA in the waiver proceeding, it points out that even if it is proper for EPA to consider the AIR/NERA/Sierra studies, they do not provide a basis for finding that California's protectiveness determination was arbitrary and capricious. CARB maintains that the Alliance has made no attempt to show that CARB's analyses are irrational, which CARB states waiver opponents must make given the ''arbitrary and capricious'' standard.

EPA agrees that to make a section 209(b)(1)(A) finding, it is not enough for waiver opponents to provide competing analyses that they claim are based on a rational set of assumptions. Rather, they must show that California's analysis, or the assumptions California relied on to support its protectiveness determination were arbitrary and capricious. Competing analyses, each based on rational assumptions, are not sufficient to deny a waiver.[94]

As previously stated, EPA does not need to decide the validity of the suggestion that the traditional numerical analysis is insufficient and that EPA must also consider the in-use effects of the standards. Given the legislative history and text of section 209(b)(2), EPA would need a concrete factual basis to examine the in-use effect of California's greenhouse gas standards on its broader LEV II program as compared to the Federal Tier II program. We need not take a position on that matter because the waiver opponents do not meet their burden to show that CARB's analysis of the in-use effects is arbitrary and capricious.[95] Rather, they present

[94] EPA's August 13, 2008 Response to Petition for Administrative Reconsideration of EPA's ZEV Waiver Decision (through the 2011 Model Year) published on December 28, 2006, at 17, note 25.

[95] To the extent that an analysis of the in-use effects of California's greenhouse gas standards may be appropriate, then such analysis properly includes consideration of the upstream emission reduction impacts identified and linked to the standards. A holistic examination of the in-use effects of a regulation should naturally include those effects that have a plausible connection to the standards, including such consequences as indirect upstream emission reductions. The March 6, 2008 Denial stated that California may otherwise have independent authority to regulate stationary sources and therefore there was no basis to include emission reductions from such sources as part of a mobile source rulemaking. However, EPA believes that the issue under section 209(b)(1)(A) is whether

rivaling analyses—each making different assumptions so that the differences in findings can be reduced to differences in assumptions. EPA finds that the Alliance has not met its burden of proof that the greenhouse gas regulations undermine California's previous LEV II and ZEV protectiveness determinations or that California was arbitrary and capricious in its greenhouse gas protectiveness determination.

EPA, therefore, finds that opponents of the waiver have not presented clear and compelling evidence that CARB was arbitrary and capricious in finding that the real-world effect of its standards ''in the aggregate'' would not lead to greater emissions of pollutants than the federal program.

D. Section 209(b)(1)(A) Conclusion

Based on the record before me, I cannot find that CARB was arbitrary and capricious in its finding that the California motor vehicle emission standards including the greenhouse gas standards are, in the aggregate, at least as protective of public health and welfare as applicable Federal standards.

V. Does California Need Its Standards To Meet Compelling and Extraordinary Conditions?

Under section 209(b)(1)(B) of the Act, I cannot grant a waiver if I find that California ''does not need such State standards to meet compelling and extraordinary conditions.'' EPA has traditionally interpreted this provision as considering whether California needs a separate motor vehicle program to meet compelling and extraordinary conditions. However in the March 6, 2008 Denial, EPA limited this interpretation to California's motor vehicle standards that are designed to address local or regional air pollution problems. EPA determined that the traditional interpretation was not appropriate for standards designed to address a global air pollution problem and its effects and that it was appropriate to address such standards separately from the remainder of the program. EPA then proceeded to find that California did not need such standards to meet compelling and extraordinary conditions. The interpretation adopted in the March 6, 2008 Denial is now before me for reconsideration.

A. Basis of March 6, 2008 Denial

In the March 6, 2008 Denial, EPA provided its reasoning for changing its long-standing interpretation of this provision, as it pertains to California standards designed to address global air pollution. EPA described its long-standing interpretation in some detail, stating that:

> Under this approach EPA does not look at whether the specific standards at issue are needed to meet compelling and extraordinary conditions related to that air pollutant. For example, EPA reviewed this issue in detail with regard to particulate matter in a 1984 waiver decision.[96] In that waiver proceeding, California argued that EPA is restricted to considering whether California needs its own motor vehicle program to meet compelling and extraordinary conditions, and not whether any given standard is necessary to meet such conditions. Opponents of the waiver in that proceeding argued that EPA was to consider whether California needed these PM standards to meet compelling and extraordinary conditions related to PM air pollution.
>
> The Administrator agreed with California that it was appropriate to look at the program as a whole in determining compliance with section 209(b)(1)(B). One justification of the Administrator was that many of the concerns with regard to having separate state standards were based on the manufacturers' worries about having to meet more than one motor vehicle program in the country, but that once a separate California program was permitted, it should not be a greater administrative hindrance to have to meet further standards in California. The Administrator also justified this decision by noting that the language of the statute referred to ''such state standards,'' which referred back to the use of the same phrase in the criterion looking at the protectiveness of the standards in the aggregate. He also noted that the phrase referred to standards in the plural, not individual standards. He considered this interpretation to be consistent with the ability of California to have some standards that are less stringent than the federal standards, as long as, per section 209(b)(1)(A), in the aggregate its standards were at least as protective as the federal standards.
>
> The Administrator further stated that in the legislative history of section 209, the phrase ''compelling and extraordinary circumstances'' refers to ''certain general circumstances, unique to California, primarily responsible for causing its air pollution problem,'' like the numerous thermal inversions caused by its local geography and wind patterns. The Administrator also noted that Congress recognized ''the presence and growth of California's vehicle population, whose emissions were thought to be responsible for ninety percent of the air pollution in certain parts of California.''[97] EPA reasoned that the term compelling and extraordinary conditions ''do not refer to the levels of pollution directly.'' Instead, the term refers primarily to the factors that tend to produce higher levels of pollution—''geographical and climatic conditions (like thermal inversions) that, when combined with large numbers and high concentrations of automobiles, create serious air pollution problems.''[98]

The Administrator summarized that under this interpretation the question to be addressed in the second criterion is whether these ''fundamental conditions'' (*i.e.* the geographical and climate conditions and large motor vehicle population) that cause air pollution continued to exist, not whether the air pollution levels for PM were compelling and extraordinary, or the extent to which these specific PM standards will address the PM air pollution problem.[99]

However in the March 6, 2008 Denial, EPA limited this interpretation to California's motor vehicle standards that are designed to address local or regional air pollution problems. EPA determined that the traditional interpretation was not appropriate for standards designed to address a global air pollution problem and its effects.[100]

With respect to a global air pollution problem like elevated concentrations of greenhouse gases, EPA's March 6, 2008 Denial found that the text of section 209(b)(1)(B) was ambiguous and does not limit EPA to this prior interpretation. In addition, EPA noted that the legislative history supported a decision to ''examine the second criterion specifically in the context of global climate change.'' The legislative history:

> [I]ndicates that Congress was moved to allow waivers of preemption for California motor vehicle standards based on the particular effects of local conditions in California on the air pollution problems in California. Congress discussed ''the unique problems faced in California as a result of its climate and topography.'' H.R. Rep. No. 728, 90th Cong. 1st Sess., at 21 (1967). See also Statement of Cong. Holifield (CA), 113 Cong. Rec. 30942–43 (1967). Congress also noted the large effect of local vehicle pollution on such local problems. See, *e.g.,* Statement of Cong. Bell (CA) 113 Cong. Rec. 30946. In particular, Congress focused on California's

the indirect reductions of ozone pollutants from stationary sources created by the greenhouse gas emission standards for motor vehicles, can reasonably be considered by California in its determination that its standards are as protective of public health and welfare as applicable federal standards. Given that the effects are reasonably related to the regulations, if it is appropriate to consider in-use effects then it was not arbitrary and capricious for California to include such effects in this analysis.

[97] *Id.* at 18890.

[98] 73 FR 12156, 12159–60 (March 6, 2008).

[99] 73 FR at 12159–60.

[100] EPA recently reaffirmed that the traditional interpretation still applied for motor vehicle standards designed to address air pollution problems that are local or regional in nature. 71 FR 78190, 78192 (December 28, 2008); *see also* 71 FR 78190 and Decision Document for Waiver of Federal Preemption for California Zero Emission Vehicle Standards, at 34.

smog problem, which is especially affected by local conditions and local pollution. See Statement of Cong. Smith (CA) 113 Cong. Rec. 30940–41 (1967); Statement of Cong. Holifield (CA), id. at 30942. See also, *MEMA I,* 627 F. 2d 1095, 1109 (DC Cir., 1979) (noting the discussion of California's ''peculiar local conditions'' in the legislative history). Congress did not justify this provision based on pollution problems of a more national or global nature in justifying this provision.[101]

Relying on this, and without any further significant discussion of either congressional intent or how this new approach properly furthered the goals of section 209(b), EPA determined that it was appropriate to:

[R]eview California's GHG standards separately from the remainder of its motor vehicle emission control program for purposes of section 209(b)(1)(B). In this context it is appropriate to give meaning to this criterion by looking at whether the emissions from California motor vehicles, as well as the local climate and topography in California, are the fundamental causal factors for the air pollution problem—elevated concentrations of greenhouse gases—apart from the other parts of California's motor vehicle program, which are intended to remediate different air pollution concerns.

EPA then proceeded to apply this interpretation to the GHG standards at issue in this waiver proceeding, and found that California did not need the GHG standards under this interpretation. Having limited the meaning of this provision to situations where the air pollution problem was local or regional in nature, EPA found that California's greenhouse gas standards do not meet this criterion. EPA found that the elevated concentrations of greenhouse gases in California are similar to concentrations elsewhere in the world, and that local conditions in California such as the local topography and climate and the number of motor vehicles in California are not the determinant factors causing the elevated GHG concentrations found in California and elsewhere. Thus, the March 6, 2008 Denial found that California did not need its GHG standards to meet compelling and extraordinary conditions, and the waiver was denied.

EPA also considered an alternative interpretation, where EPA would consider ''the effects in California of this global air pollution problem in California in comparison to the rest of the country, again addressing the GHG standards separately from the rest of California's motor vehicle program.'' Under this alternative interpretation, EPA considered whether the impacts of global climate change in California were significant enough and different enough from the rest of the country such that California could be considered to need its greenhouse gas standards to meet compelling and extraordinary conditions. EPA determined that the waiver should be denied under this alternative interpretation as well.

B. Should EPA Review This Criterion Based on the Need for California's Motor Vehicle Program or the Need for the GHG Standards?

The essential first question to resolve in addressing whether California needs ''such State standards to meet compelling and extraordinary conditions'' is whether it is appropriate for EPA to evaluate this criterion based on California's need for its motor vehicle program as a whole, or to evaluate only the particular standards being addressed in this waiver proceeding.

1. Comments Supporting a Review of the Entire Program

In its initial waiver request, CARB restates its need for its own engine and vehicle programs to meet serious air pollution problems. It notes that the relevant inquiry is whether California needs its own emission control program as opposed to the need for any given standard as necessary to meet compelling and extraordinary conditions. CARB notes that in prior waivers the Administrator has determined that:

''[C]ompelling and extraordinary conditions'' does not refer to levels of pollution directly, but primarily to the factors that tend to produce them: geographical and climatic conditions that, when combined with large numbers and high concentrations of automobiles create serious air pollution problems.''

In its initial waiver request letter, CARB stated:

California, the South Coast and San Joaquin Air basins in particular, continues to experience some of the worst air quality in the nation. California's ongoing need for dramatic emission reductions generally and from passenger vehicles specifically is abundantly clear from its recent adoption of state implementation plans for the South Coast and other California air basins. The unique geographical and climatic conditions, and the tremendous growth in the vehicle population and use which moved Congress to authorize California to establish separate vehicle standards in 1967, still exist today.[102]

CARB notes that these conditions have not changed to warrant a change in confirmation by EPA and that the opponents of the waiver bear the burden on showing why California no longer has a compelling need, informed by its own circumstances and benefits that would accrue to it and other states.

EPA also received comment that the *Massachusetts* v. *EPA* holding suggests that EPA should treat greenhouse gases just like all other air pollutants when evaluating a section 209(b) waiver request for greenhouse gases. These comments suggest that once the Supreme Court clarified that greenhouse gases are Clean Air Act air pollutants, there was no room left to distinguish greenhouse gases from other air pollutants when evaluating waiver requests under section 209(b). These comments suggest that EPA ought not to treat elevated concentrations of greenhouse gases as an air pollution problem different from California's traditional air pollution problems. Likewise, the comments suggest, greenhouse gas pollutants should be treated just like other air pollutants which give rise to the need for California's motor vehicle emission program, and, therefore, be subject to EPA's traditional section 209(b)(1)(B) analysis.

Several commenters suggest that review of California's need for its motor vehicle emissions program as a whole is not only appropriate but is mandated by the statute.

2. Comments Supporting a Review of the GHG Standards Separately

Several commenters opposing the GHG waiver request have advocated that EPA should review California's GHG standards separately under the ''compelling and extraordinary conditions'' criterion. Essentially, this would require that EPA's determination be based on California's need for GHG standards in isolation of its need for its own motor vehicle emissions program.

These commenters state that the statute requires a linkage between the compelling and extraordinary conditions and the particular standards that California wishes to enforce, and that a set of standards that cannot be linked to the compelling and extraordinary conditions cannot be said to be needed to meet such conditions. The commenters note that the statute refers to ''standards''—not to a ''program''—and that such an approach would shield regulations that would not meet the criterion from any review simply by referring to other regulations that do meet the criterion. Moreover, they state that the need for such standards must be based on the particular characteristics (topography, photochemistry) that make California's conditions compelling and

[101] 73 FR at 12161.

[102] California Air Resources Board, EPA–HQ–OAR–2006–0173–0004.1 at 27.

extraordinary, whereas global climate change (and, thus, control of GHGs) is not related to such conditions.

Included among the comments suggesting that section 209(b) was intended to allow California to address local air pollution problems and not global environmental issues like climate change was an argument that the phrase ''need for such State standards to meet compelling and extraordinary conditions'' is unambiguous.[103] That lack of ambiguity, according to these comments, compels the conclusion that global warming is not the type of condition California was meant to address with its motor vehicle emissions program. These commenters further suggest that the intent of Congress was to allow California the ability to set its own standards to address the state's unique local air pollution problems and ''scientific evidence confirms that California's temperature trends are neither unique nor particularly distinct from those of at least a dozen other States.''

3. Decision

After reviewing the comments and the March 6, 2008 Denial, I believe the better approach is to review California's need for its new motor vehicle emissions program as a whole to meet compelling and extraordinary conditions, and not to apply this criterion to specific standards, or to limit it to standards designed to address only local or regional air pollution problems. The traditional approach to interpreting this provision is the best approach for considering a waiver for greenhouse standards, as well as a waiver for standards designed to address local or regional air pollution problems.[104] Therefore, I believe the interpretation that was applied in the March 6, 2008 Denial should be rejected and no longer be followed.

This traditional interpretation is the most straightforward reading of the text and legislative history of section 209(b). Congress decided in 1977 to allow California to promulgate individual standards that are not as stringent as comparable federal standards, as long as the standards are ''in the aggregate, at least as protective of public health and welfare as applicable federal standards.'' This decision by Congress requires EPA to allow California to promulgate individual standards that, in and of themselves, might not be considered needed to meet compelling and extraordinary circumstances, but are part of California's overall approach to reducing vehicle emissions to address air pollution problems.

EPA is to determine whether California's determination is arbitrary and capricious under section 209(b)(1)(A), and is to determine whether California does not need ''such State standards'' to meet compelling and extraordinary conditions. The natural reading of these provisions leads EPA to consider the same group of standards that California considered in making its protectiveness determination. While the words ''in the aggregate'' are not specifically applicable to section 209(b)(1)(B), it does refer to the need for ''such State standards,'' rather than ''each State standard'' or otherwise indicate a standard-by-standard analysis.

In addition, EPA's March 6, 2008 Denial determined that this provision was appropriately interpreted to consider California's standards as a group for standards designed to address local or regional air pollution problems, but should be interpreted in the opposite fashion for standards designed to address global air pollution problems. The text of the provision, however, draws no such distinction, and provides no indication other than Congress intended a single interpretation for this provision, not one that varied based on the kind of air pollution problem at issue.

The March 6, 2008 Denial considered the legislative history, and determined that Congress was motivated by concern over local conditions in California that lead to local or regional air pollution problems. From this, EPA determined that Congress intended to allow California to address these kinds of local or regional air pollution problems, but no others. In effect, EPA inferred from the discussion in the legislative history that Congress intended to limit California's authority in this way, and to prohibit a waiver for California standards aimed at global air pollution problems.

This ignores the main thrust of the text and legislative history of section 209(b), and improperly reads too much into an absence of discussion of global air pollution problems in the legislative history. The structure of section 209, both as adopted in 1967 and as amended in 1977, is notable in its focus on limiting the ability of EPA to deny a waiver, and thereby preserves discretion for California to construct its motor vehicle program as it deems appropriate to protect the health and welfare of its citizens. The legislative history indicates Congress quite intentionally restricted and limited EPA's review of California's standards, and its express legislative intent was to ''provide the broadest possible discretion [to California] in selecting the best means to protect the health of its citizens and the public welfare.''[105] The DC Circuit recognized that ''[t]he history of the congressional consideration of the California waiver provision, from its original enactment up through 1977, indicates that Congress intended the State to continue and expand its pioneering efforts at adopting and enforcing motor vehicle emission standards different from and in large measure more advanced than the corresponding federal program. In short, to act as a kind of laboratory for innovation. * * * For a court [to limit California's authority] despite the absence of such an indication would only frustrate the congressional intent.''[106]

In this context, it is fully consistent with the expressed intention of Congress to interpret section 209(b)(1)(B) the same way both for standards designed to address local and regional air pollution problems, and standards designed to address global air pollution problems. Congress intended to provide California the broadest possible discretion to develop its motor vehicle emissions program. Neither the text nor the legislative history of section 209(b) indicates that Congress intended to limit this broad discretion to a certain kind of air pollution problem, or to take away all discretion with respect to global air pollution problems.[107] In

[103] This comment, suggesting that the ''need for such State standards to meet compelling and extraordinary conditions,'' is made under Step 1 of the test established under *Chevron, USA., Inc.* v. *NRDC.*

[104] The traditional interpretation of section 209(b)(1)(B) is certainly not ''unambiguous precluded'' by the language of the statute. See *Entergy Corp.* v. *Riverkeeper, Inc.,* 129 S.Ct. 1498 (2009)(''That view governs if it is a reasonable interpretation of the statute—not necessarily the only possible interpretation, nor even the interpretation deemed most reasonable by the courts. *Chevron U.S.A. Inc.* v. *Natural Resources Defense Council, Inc.,* 467 U.S. 837, 843–844 (1984).'') (''It seems to us, therefore, that the phrase ''best available,'' even with the added specification ''for minimizing adverse environmental impact,'' does not unambiguously preclude cost-benefit analysis.''). *Carrow* v. *Merit Systems Protection Board,* 564 F.3d 1359 (Fed. Cir. 2009) (''[W]e are obligated to give controlling effect to [agency's] interpretation if it is reasonable and is not contrary to the unambiguously expressed intent of Congress'', citing *Entergy Corp.*).

[105] H.R. Rep. No. 294, 95th Cong., 1st Sess. 301–302 (1977). *See MEMA,* 627 F. 2d at 1110–11.

[106] *MEMA,* 627 F. 2d at 1111.

[107] This broad interpretation of section 209(b) is similar to the broad reading the Court provided to section 302(g) of the Clean Air Act when it held that the term ''air pollutant'' included greenhouse gases, rejecting among other things the argument that Congress limited the term to apply only to certain kinds of air pollution. *Massachusetts* v. *EPA,* 549 U.S. 497, 532 footnote 26.

addition, applying the traditional interpretation to greenhouse gas standards does not change the basic nature of the compromise established by Congress—California could act as the laboratory for the nation with respect to motor vehicle emission control, and manufacturers would continue to face just two sets of emissions standards—California's and EPA's.

This interpretation is directly in line with the purpose of Congress, as compared to the interpretation adopted in the March 6, 2008 Denial. The 2008 interpretation relied on the discussion in the legislative history of local conditions in California leading to air pollution problems like ozone. While this was properly read to support the view that this provision should be interpreted to address California's need for a motor vehicle program as a whole, the March 6, 2008 Denial went further and inferred that by discussing such local conditions, Congress also intended to limit California's discretion to only these kinds of local or regional air pollution problems. The March 6, 2008 Denial pointed to no particular language in the legislative history or the text of section 209(b) indicating such, instead, congressional intent to limit California's discretion was inferred from the discussion of local conditions. However, basing a limitation on such an inference is not appropriate given the express indication that Congress intended to provide California the ''broadest possible discretion'' in selecting the best means to protect the health of its citizens and the public welfare.

The text of section 209(b) and the legislative history, when viewed as a whole, leads me to conclude that the interpretation adopted in the March 6, 2008 Denial should be rejected. The better way to interpret this provision is to apply the traditional interpretation to the evaluation of California's greenhouse gas standards for motor vehicles. If California needs a separate motor vehicle program to address the kinds of compelling and extraordinary conditions discussed in the traditional interpretation, then Congress intended that California could have such a program. Congress also intentionally provided California the broadest possible discretion in adopting the kind of standards in its motor vehicle program that California determines are appropriate to address air pollution problems that exist in California, whether or not those problems are local or regional in nature, and to protect the health and welfare of its citizens. The better interpretation of the text and legislative history of this provision is that Congress did not intend this criterion to limit California's discretion to a certain category of air pollution problems, to the exclusion of others. In this context it is important to note that air pollution problems, including local or regional air pollution problems, do not occur in isolation. Ozone and PM air pollution, traditionally seen as local or regional air pollution problems, occur in a context that to some extent can involve long range transport of this air pollution or its precursors. This long-range or global aspect of ozone and PM can have an impact on local or regional levels, as part of the background in which the local or regional air pollution problem occurs. As discussed later, the effects of global concentrations of greenhouse gases can have an impact on local ozone levels. This context for air pollution problems supports the view that Congress did not draw such a line between the types of air pollution problems under this criterion, and that EPA should not implement this criterion in a narrow way restricting how California determines it should develop its motor vehicle program to protect the health and welfare of its citizens.[108]

This approach does not make section 209(b)(1)(B) a nullity, as some have suggested. EPA must still determine whether California does not need its motor vehicle program to meet the compelling and extraordinary conditions discussed in the legislative history. If that is the case, then a waiver would be denied on those grounds. As discussed below, that is not the case at this point, even though conditions in California may one day improve such that it no longer has the need for a separate motor vehicle program. The statute contemplates that such improvement is possible. In addition, the opponents of a waiver always have the ability to raise their legal, policy, and other concerns in the State administrative process, or through judicial review in State courts. Congress, however, provided EPA a much more limited role under section 209(b) in considering objections raised by opponents of a waiver.

For these reasons, I believe that the better approach for analyzing the need for ''such State standards'' to meet ''compelling and extraordinary conditions'' is to review California's need for its program, as a whole, for the class or category of vehicles being regulated, as opposed to its need for individual standards.

Having adopted this interpretation of section 209(b)(1)(B), I apply it below to determine whether EPA can find that California does not need its motor vehicle program to meet compelling and extraordinary conditions. Given the basis for EPA's March 6, 2008 Denial and the considerable debate regarding the permissible interpretations of this provision, EPA has also evaluated this criterion reviewing the greenhouse gas standards separately—using the two interpretations discussed in the March 6, 2008 Denial. In either case, EPA also cannot deny California's request for a waiver based on a finding that California does not need such standards to meet compelling and extraordinary circumstances.

C. Does California Need Its Motor Vehicle Program To Meet Compelling and Extraordinary Conditions?

As discussed above, the better interpretation of this criterion, adopted herein, is the traditional approach of evaluating California's need for a separate program to meet compelling and extraordinary conditions. Applying this approach, with due deference to California, I cannot deny the waiver.

CARB has repeatedly demonstrated the need for its motor vehicle program to address compelling and extraordinary conditions in California. In its Waiver Request letter, CARB stated:

> California—the South Coast and San Joaquin Air basins in particular—continues to experience some of the worst air quality in the nation. California's ongoing need for dramatic emission reductions generally and from passenger vehicles specifically is abundantly clear from its recent adoption of state implementation plans for the South Coast and other California air basins.[109] The unique geographical and climatic conditions, and the tremendous growth in the vehicle population and use which moved Congress to

[108] *See Massachusetts* v. *EPA, ''*While the Congresses that drafted section 202(a)(1) might not have appreciated the possibility that burning fossil fuels could lead to global warming, they did understand that without regulatory flexibility, changing circumstances and scientific developments would soon render the Clean Air Act obsolete. The broad language of section 202(a)(1) reflects an intentional effort to confer the flexibility necessary to forestall such obsolescence. See *Pennsylvania Dept. of Corrections* v. *Yeskey,* 524 U.S. 206, 212 (1998) (''[T]he fact that a statute can be applied in situations not expressly anticipated by Congress does not demonstrate ambiguity. It demonstrates breadth'' (internal quotation marks omitted)). Because greenhouse gases fit well within the Clean Air Act's capacious definition of ''air pollutant,'' we hold that EPA has the statutory authority to regulate the emission of such gases from new motor vehicles.'' 549 U.S. 497 at 532.

[109] See *e.g.* Approval and Promulgation of State Implementation Plans; California—South Coast, 64 FR 1770, 1771 (January 12, 1999). See also 69 FR 23858, 23881–90 (April 30, 2004) (designating 15 areas in California as nonattainment for the federal 8-hour ozone national ambient air quality standard).

authorize California to establish separate vehicle standards in 1967, still exist today.[110]

CARB notes in its July 14, 2007 comments that it testified at EPA's earlier hearings on this waiver request that ''since nothing has changed in the few months since EPA last easily made this determination [regarding the need for the motor vehicle emission program] on December 28, 2006 (71 FR 78190), and since California still has the ''geographical and climatic conditions that, when combined with the large numbers and high concentrations of automobiles, create serious pollution problems,'' (49 FR at 18890 (citing legislative history)), this is the end of a proper and legal EPA analysis of the extraordinary and compelling conditions waiver prong.'' [111]

EPA has not received any adverse comments suggesting that California no longer needs a separate motor vehicle emissions program to address the various conditions that lead to serious and unique air pollution problems in California.

Based on the record, I am unable to identify any change in circumstances or any evidence to suggest that the conditions that Congress identified as giving rise to serious air quality problems in California no longer exist. Therefore, using the traditional approach of reviewing the need for a separate California program to meet compelling and extraordinary conditions, I cannot deny the waiver based on this criterion.

D. Does California Need Its Motor Vehicle GHG Standards To Meet Compelling and Extraordinary Conditions?

As discussed above, EPA has also evaluated this criterion under two alternative approaches, reviewing the greenhouse gas standards separately using the two interpretations discussed in the March 6, 2008 Denial. While recognizing that they are not the interpretations adopted here by EPA, this section discusses the Agency's consideration of these alternative interpretations.

1. Are California's GHG Standards Designed in Part To Address an Air Pollution Problem That Is Local or Regional in Nature?

In the March 6, 2008 Denial, EPA interpreted this criterion as calling for a review of California's GHG standards separately from the remainder of its motor vehicle emission control program. In that context, it was determined appropriate to look at whether the emissions from California motor vehicles, as well as the local climate and topography in California, are the fundamental causal factors for the air pollution problem of greenhouse gases. This interpretation limited the meaning of this provision to situations where the motor vehicle standards at issue were designed to address an air pollution problem that was local or regional in nature, such that the local conditions in California were the fundamental causes of the air pollution problem.

The March 6, 2008 Denial applied this interpretation by focusing on elevated concentrations of greenhouse gases as the air pollution—a global air pollution problem. The March 6, 2008 Denial rejected arguments that the GHG standards should also been seen as an ozone control strategy, on the grounds that even if elevated concentrations of greenhouse gases lead to climate changes that exacerbate ozone, the causes of elevated concentrations of greenhouse gases are not solely local to California but are global in nature.

This overly narrow view fails to consider that although the factors that cause ozone are primarily local in nature and that ozone is a local or regional air pollution problem, the impacts of global climate change can nevertheless exacerbate this local air pollution problem. Whether or not local conditions are the primary cause of elevated concentrations of greenhouse gases and climate change, California has made a case that its greenhouse gas standards are linked to amelioration of California's smog problems. Reducing ozone levels in California cities and agricultural areas is expected to become harder with advancing climate change. California and many other commenters note that ''California's high ozone levels—clearly a condition Congress considered—will be exacerbated by higher temperatures from global warming.'' [112] California also notes that there is general consensus that temperature increases from climate change will exacerbate the historic climate, topography, and population factors conducive to smog formation in California, which were the driving forces behind Congress' inclusion of the waiver provision in the Clean Air Act.[113] There is a logical link between the local air pollution problem of ozone and California's desire to reduce GHGs as one way to address the adverse impact that climate change may have on local ozone conditions.[114] Given the clear deference that Congress intended to provide California on the mechanisms it chooses to use to address its air pollution problems, it would be appropriate to consider its GHG standards as designed in part to help address a local air pollution problem, and, thus, a waiver should not be denied even under the narrow interpretation employed in the March 6, 2008 Denial.

2. Do the Impacts of Climate Change in California Support a Denial of the Waiver?

As part of EPA's March 6, 2008 Denial, EPA also considered an alternative interpretation for this criterion, where EPA would consider ''the effects in California of this global air pollution problem * * * in comparison to the rest of the country, again addressing the GHG standards separately from the rest of California's motor vehicle program.'' EPA considered evidence and arguments submitted by commenters concerning whether the impacts of global climate change in California were significant enough and different enough from the rest of the country such that California could be considered to need its greenhouse gas standards to meet compelling and extraordinary conditions.[115] EPA determined in the March 6, 2008 Denial that the waiver should be denied under this approach as well.

[110] California Air Resources Board, EPA–HQ–OAR–2006–0173–0004.1, at 16.

[111] California Air Resources Board, EPA–HQ–OAR–2006–0173–1686 at 7.

[112] California submits evidence that at the national scale, using global to regional air quality models, various papers demonstrate that climate change alone can worsen summertime surface ozone pollution in polluted regions of the United States including one finding that ''climate change alone will increase summertime ozone in polluted regions by 1–10 ppb over the coming decades, with the largest effects in urban areas and during pollution episodes'' and therefore ''climate change will partly offset the benefit of the emissions reductions.'' See Jacob and Winner (2009), EPA–HQ–OAR–2006–0173–9010.4. CARB also cites the 2007 Interim Report of the U.S. EPA Global Change Research Program Assessment of the Impacts of Global Change on Regional U.S. Air Quality, a draft EPA study which concludes that climate change may significantly increase ground-level ozone in areas throughout the nation. See also EPA's final April 2009 ''Assessment of the Impacts of Global Climate Change on Regional U.S. Air Quality: A Synthesis of Climate Change Impacts on Ground-Level Ozone'' which states as one of its general findings: ''[W]hile these modeling studies cannot tell us what the future will hold, they demonstrate the potential for global climate change to make U.S. air quality management more difficult, and therefore future air quality management decisions should begin to account for the impacts of climate change.'' EPA–HQ–OAR–2006–0173–9006 at 7–9.

[113] *Id.*

[114] California also submits evidence that its GHG emission regulations would result in a slight reduction of ozone precursors. EPA–HQ–OAR–2006–0173–9006 at 10.

[115] 73 FR 12156, 12164.

As discussed above, this is not the interpretation that EPA now adopts. However, even if EPA were to examine the impacts of climate change in California under this interpretation, based on a review of all the evidence in the record, I cannot deny the waiver.

a. What Test Applies Under This Alternative Approach?

In the March 6, 2008 Denial, EPA found that legislative intent called for particular circumstances in California that are ''sufficiently different'' from the nation as a whole that justify separate standards in California.

EPA received comment stating that there is no statutory foundation for a ''sufficiently different'' test. Commenters noted there is nothing in the term ''compelling and extraordinary conditions'' that requires a comparison to the rest of the country. Similarly, commenters point to EPA's 1984 PM waiver where EPA's Administrator found that ''there is no indication in the language of section 209 or the legislative history that California's pollution problem must be the worst in the country for a waiver to be granted.'' EPA also received comment that it was not reasonable for EPA to conclude that California does not face global warming impacts, including water supply, agricultural production, and wildfire seasonal impacts that present compelling and extraordinary conditions, since other states will face similar impacts. Under this rationale, since states other than California are also experiencing serious global warming impacts, California could never receive a waiver to combat climate change. Commenters find flaw in this rationale: similar impacts in other states have never before prevented California from receiving a waiver. Even though many states are faced with non-attainment ozone areas and smog problems similar to California, California has never had a waiver denied based on a finding under section 209(b)(1)(B) that it did not need its standards to meet compelling and extraordinary conditions. As such, EPA also received comment suggesting that the impacts of climate change should be reviewed within the State of California to determine their severity, and that such impacts need not be compared to impacts experienced or projected to occur elsewhere in the country.

Several commenters maintain that although the impacts of climate change in California may be compelling, they are not extraordinary when compared to the rest of the nation.[116] These commenters point to the record and the many submissions from other states, which recount the variety of impacts and risks of climate change in their respective states and claim that California is no different than any other state.

EPA does not need to resolve this issue. As discussed below, EPA has evaluated the evidence submitted concerning the observed and projected impacts of global climate change in California and other states and determined that even under the alternative approach used in the March 6, 2008 Denial, EPA cannot deny a waiver.

b. Would a Waiver Be Denied Under This Alternative Approach?

Commenters supporting the waiver maintain that California has clearly demonstrated that the impacts in California of global warming are ''compelling and extraordinary.'' Several commenters point to the impacts of global warming recited in EPA's March 6, 2008 initial denial as evidence that EPA committed an error in judgment by not finding that the extreme and various impacts of climate change in California are compelling and extraordinary in nature and that, further, California clearly satisfied the section 209(b)(1)(B) requirements.[117]

Commenters supporting the waiver, including California, have submitted an extensive array of reports and data outlining the risks and impacts of climate change on California. EPA received comment restating EPA's own statements from its March 6, 2008 Denial, including the following:

> California has the largest agricultural based economy (13% of the U.S. market value of agricultural products sold) which is heavily dependent on irrigation, has the nation's highest crop value and is the nation's leading dairy producer. There is improved information on how livestock productivity may be affected by thermal stress and through nutritional changes in forage caused by elevated CO_2 concentrations. In addition, wine is California's highest value agricultural product, and wine grapes are very sensitive to temperature changes. California has the largest state coast population, representing 25% of the U.S. oceanic coastal population. The conditions which create California's tropospheric ozone problems remain (*e.g.,* topography, regional meteorology, number of vehicles) and climate change is expected to exacerbate tropospheric ozone levels. California's water resources are already stressed due to demands from agricultural, industrial and municipal uses, and climate change is expected to introduce an additional stress to an already over-allocate system by increasing temperatures and by decreasing snowpack which is an important water source in spring and summer. California has the greatest variety of ecosystems in the U.S., and the second most threatened and endangered species (of plants and animals combined) and the most threatened and endangered animal species, representing about 21% of the U.S. total.

In addition, one commenter suggests that this summary of findings about California's special characteristics that differentiate the magnitude, intensity and range of impacts of climate change supports that assessment. Dr. Stephen Schneider of Stanford University stated that ''not only are California's conditions 'unique and arguably more severe' (*e.g.* temperature impacts from global warming are more certain for states like California) but also that no other state faces the combination of ozone exacerbation, wildfire emission's contributions, water system and coast system impacts and other impacts faced by California.'' [118] Conversely, opponents of the waiver do not contest California's claims that the impacts of climate change in California and elsewhere are substantial.[119] Instead,

[116] Association of International Automobile Manufacturers, EPA–HQ–OAR–2006–0173–9005. This comment notes the finding in *Massachusetts* v. *EPA* that the impacts of global warming are ''widely shared'' among the states.

[117] EPA has not received any comment suggesting EPA's prior inventory of evidentiary information is incorrect as set forth in its discussion of the ''Relationship of Impacts of Global Climate Change in California to the Rest of the Country'' at 73 FR 12156, 12163–12168. In addition, several new studies have been submitted to EPA, including: a recent report from the Pacific Institute examining the impacts that sea level rise would have on population, infrastructure, and property in California (this report uses projections of medium to medium-high greenhouse gas emissions scenarios indicating a 1.4 meter rise in the seal level by 2100 with 480,000 people at risk and $100 million in property at risk from a 100 year flood event); California's Climate Action Team Reports that emphasizes many of the points made in California's waiver request including the air quality impacts (''Climate change could slow progress toward attainment of health-based air quality standards and increase pollution control costs by increasing the potential for high ozone and high particulate days.'' The report itself synthesizes 37 recent reports that address a wide body of information on the range and gravity of the risks that climate change poses to California's citizens, natural resources, and economy); and the Public Policy Institute of California assessment of climate change on public health in California and cites number impacts including ''an increase in the frequency and severity of air pollution episodes'' and ''an increase in extreme heat events and associated increases in heat related morbidity and mortality.'' *See* Environmental Defense Fund, EPA–HQ–OAR–2006–0173–9025 at 15–18; *See also* California Air Resources Board, EPA–HQ–OAR–2006–0173–9006 at 7–16.

[118] Environmental Defense Fund, EPA–HQ–OAR–2006–0173–9025 at 11–12.

[119] The Association of International Automobile Manufacturers notes that although in the March 6, 2008 Denial, ''EPA found that there is ample evidence that global warming is 'compelling' in the

opponents of the waiver claim that the impacts in California are not unique or extraordinary. EPA received comment suggesting that the impacts of climate change in California are not sufficiently different from the nation as a whole to warrant a waiver.[120] Commenters note that the ''need'' requirement in section 209(b)(1)(B) authorizes the creation of regulatory standards specific to California only in cases where it is necessary to meet conditions unique to California. Commenters claim that California cannot meet this standard with respect to a global problem that does not affect California in a unique way as compared to other states. The commenters claim the impacts to coastline, ozone levels, and other impacts are not unique to California as they affect many other states as well.[121]

EPA notes that under this alternative approach the opponents of the waiver continue to bear the burden of proof to demonstrate their claims. Commenters opposing the waiver primarily focus and argue on one issue: Whether the effects of climate change in California are sufficiently different from the nation as a whole. Opponents of the waiver identify singular or multiple impacts in some other states but they largely submit conclusions—not factual evidence—as to why such adverse impacts demonstrate that California is not sufficiently different. On the other hand, California has identified a wide variety of impacts and potential impacts within California, which include exacerbation of tropospheric ozone, heat waves, sea level rise and salt water intrusion, an intensification of wildfires, disruption of water resources by, among other things, decreased snowpack levels, harm to high value agricultural production, harm to livestock production, and additional stresses to sensitive and endangered species and ecosystems. Opponents have not demonstrated that any other state, group of states, or area within the United States would face a similar or wider-range of vulnerabilities and risks. In addition, California has submitted information that climate change can impact ozone levels in California due to temperature exacerbation effects. Although other areas of the country are also projected to experience increases in temperatures which may also exacerbate local ozone levels, opponents of the waiver have not demonstrated that California's ozone levels should not be considered compelling and extraordinary conditions.

Under this alternative interpretation, the burden of proof is on the opponents of the waiver to demonstrate that the impacts of global climate change in California are either not significant enough or are not different enough from the rest of the country to be considered compelling and extraordinary conditions. The opponents of the waiver have focused their argument on the latter part of this interpretation, whether the impacts in California are sufficiently different from the rest of the country. Limiting evaluation to this issue, California has presented evidence of a wide variety of vulnerabilities, impacts and potential impacts within California, while the opponents have not demonstrated that any other state, group of states, or area within the United States would face a similar or wider-range of vulnerabilities and risks. Therefore, EPA believes that those opposing the waiver have not met their burden of proof to demonstrate that the conditions in California are not sufficiently different and that a waiver should be denied under this alternative approach.

It is important to note that nothing in this decision or this document should be construed as reflecting a judgment concerning the issues pending before EPA under section 202(a) of the Act—whether emissions of GHGs from new motor vehicles or engines cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare. EPA recently proposed to make an affirmative finding under that statutory provision.[122] The issues involved in that proposal are separate and different from those involved in this decision on California's request for a waiver under section 209(b). Nothing in this decision should be construed as reflecting the Agency's judgment regarding any issue relevant to the determinations in the pending proposal under section 202(a). The statutory provisions and criteria are different, and the judgments called for under these provisions are very different in nature. For example, in evaluating the alternative section 209(b)(1)(B) interpretation, I am not evaluating how serious the impacts or potential impacts of global climate change are, either in California or the rest of the country, as the opponents of the waiver have not focused on that issue. My finding under this alternative interpretation is a narrow one, and is limited to finding that the opponents of the waiver have not met their burden of proof under this alternative interpretation of section 209(b) concerning how the impacts in California might differ from the rest of the country.

3. Must California's GHG Standards Achieve a Demonstrated Reduction in GHG Atmospheric Concentrations or Impacts Under Section 209(b)(1)(B)?

Regardless of whether EPA examines the need for California's motor vehicle emissions program or conversely the need just for the GHG emission standards, some commenters suggest

---

sense that it presents serious environmental issues, the agency correctly determined that it does not present an extraordinary condition in California.'' EPA–HQ–OAR–2006–0173–9005 at 9. EPA did receive comment from Air Improvement Resources (AIR) suggesting that it might be contesting whether positive feedback from CO_2 concentrations on temperature increases (as seen in the models and data submitted to EPA by proponents of the waiver) will be seen in certain geographic areas due to an increase in cloudiness. EPA–HQ–OAR–2006–0173–13662 at 5–6. However, in its same submission it also states that while it may be true that California's cities will be disproportionately affected by increased temperatures it is by no means clear that this will be true in the future. (See p. 7). As noted in the text, the burden of proof is on the opponents of the waiver to demonstrate that the effects of climate change are not compelling or serious. Such opponents have not clearly stated the basis for making such a determination nor countered the many studies and data submitted by California and other proponents of the waiver. For purposes of this waiver proceeding, EPA is not making its own judgment with regard to the issues under section 202(a).

[120] Association of International Automobile Manufacturers, EPA–HQ–OAR–2006–0173–9005 at 9, citing 73 FR 12168—''As the discussion above indicates, global climate change has affected, and is expected to affect, the nation, indeed the world, in ways very similar to the conditions noted in California * * * These identified impacts are found to affect other parts of the United States and therefore these effects are not sufficiently different compared to the nation as a whole. California's precipitation increases are not qualitatively different from changes in other areas. Rise in sea level in the coastal parts of the United States are projected to be severe, or more severe, particularly in consequences, in the Atlantic and Gulf Regions than in the Pacific regions, which includes California. Temperature increases have occurred in most parts of the United States, and while California's temperatures have increased by more than the national average, there are other places in the United States with higher or similar increases in temperature.''

[121] *Id.* at 9–10. The Association of International Automobile Manufacturers notes that comments submitted from States supporting the waiver include statements such as ''Connecticut faces loss of its shoreline and beaches, forest die offs, destruction of shell fisheries and marine resources, * * *'' ''Global warming is having a serious impact on New Jersey's public health and economy * * *'' ''Rhode Island * * * As the most densely populated State in the country, direct impacts due to climate change, such as heat wave, increased fire frequency, increased storm intensity resulting in beach erosion, loss of property, and loss of life—pose great concerns for us,'' and other concerns expressed by states such as Pennsylvania, Maryland, and New Mexico. See also Alliance of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–1297 at 14–17 and EPA–HQ–OAR–2006–0173–0421–12 at 61–70 and General Motors Corporation, EPA–HQ–OAR–2006–0173–1596 at 6–8.

[122] See EPA's ''Proposed Endangerment and Cause or Contribute Findings for Greenhouse Gases under Section 202(a) of the Clean Air Act'' at 74 FR 18886 (April 29, 2009).

that the GHG emission standards must be proven to have some mitigative effect in order for them to be needed. Some commenters suggest that to the extent that California's high ozone levels could be exacerbated by higher temperatures from global warming, there is no demonstration in the waiver record that implementation of the California GHG standards would have any perceptible impact on temperature trends in California. Opponents of the waiver have argued that California, therefore, cannot show that its GHG emission regulations will achieve a measurable and specific temperature reduction in California, and thereby mitigate the identified climate change impacts in California.[123] They maintain that California's GHG regulations will not be needed to meet a particular condition since there is no analysis suggesting that California's GHG standards will have any discernible impact on that condition or achieve any perceptible improvement in environmental conditions inside California. In terms of GHG concentrations in California's atmosphere, EPA received comment stating there is no offered proof that a reduction in GHG emissions from California vehicles would have any impact on GHG concentrations in California's atmosphere compared to the GHG concentration impacts already in the record.

In response, other commenters supporting the waiver assert that the efficacy of California's standards is not at issue in this proceeding. There is no requirement in section 209(b)(1)(B) that California prove a certain level of environmental benefit. They assert that is particularly true in this instance, where the actual and anticipated impacts of global warming are complex and historically unprecedented, and it is widely-recognized that a number of efforts by governments, private entities, and individuals globally will be required to mitigate climate change, as no single source of GHG emissions, whether from an entire state, sector of the nation's economy, or of individual countries, is completely dominant in terms of influencing atmospheric concentrations of GHGs. They claim that California need not show that the climate will in fact respond to its regulatory action; rather its obligation is to show a rational connection between the regulation it has promulgated and the problem it seeks to address.

As noted above, the Agency's inquiry under section 209(b)(1)(B) is whether California needs its own motor vehicle emission control program to meet compelling and extraordinary conditions. Under this criterion, EPA does not consider, for example, the extent to which specific PM standards will address the PM air pollution problem.[124] Under this approach, there is no need to delve into the extent to which the GHG standards at issue here would address climate change or ozone problems. That is an issue appropriately left to California's judgment.

Given the comments submitted, however, EPA has also considered an alternative interpretation, which would evaluate whether the program or standards has a rational relationship to contributing to amelioration of the air pollution problems in California. Even under this approach, EPA's inquiry would end there. California's policy judgment that an incremental, directional improvement will occur and is worth pursuing is entitled, in EPA's judgment, to great deference.[125] EPA's consistent view is that it should give deference to California's policy judgments, as it has in past waiver decisions, on California's choice of mechanism used to address air pollution problems. EPA does not second-guess the wisdom or efficacy of California's standards.[126] EPA has also considered this approach with respect to the specific GHG standards themselves, as well as California's motor vehicle emissions program.

After reviewing the arguments, I conclude that California has submitted evidence demonstrating not only the causal connection between higher temperatures from global warming and its general exacerbation of tropospheric ozone, but also the serious effects of that potential increase in ozone on the public health and welfare in California. EPA notes that several commenters have stated that while California's GHG regulations will provide only a small difference in temperatures and/or GHG concentrations, there clearly will be some reductions. These commenters note that given the numerous sources in California and around the world that contribute to GHG concentrations, no single regulation could on its own reduce GHG emissions to the levels necessary to reduce all concerns, but that every small reduction is helpful in reducing these concerns. As noted by the Supreme Court in *Massachusetts* v. *EPA,* while it is true that regulating motor vehicle GHG emissions will not by itself reverse global warming, a reduction in domestic automobile emissions would slow the pace of global emissions increase no matter what happens with regard to other emissions.[127] Moreover, there is some evidence in the record that proffers a specific level of reduction in temperature resulting from California's regulations.[128] EPA believes that under this alternative approach, opponents have not met their burden of demonstrating that California's motor vehicle program, or its GHG standards, does not have a rational relationship to contributing to amelioration of the air pollution problems in California.

E. Section 209(b)(1)(B) Conclusion

With respect to the need for California's state standards to meet compelling and extraordinary conditions, I have found that the March 6, 2008 Denial was based on a departure from the traditional interpretation of the waiver provision. An examination of the text of section 209(b) and the legislative history, when viewed together, lead to the conclusion that the best way to interpret this provision and the interpretation I adopt here, is to apply the traditional interpretation to the evaluation of California's greenhouse gas standards for motor vehicles. As such, if California needs a separate motor vehicle program to address the kinds of compelling and extraordinary conditions discussed in the traditional interpretation, then Congress intended that California could have such a program. The best interpretation of the text and legislative history of this provision is that Congress did not use this criterion to limit California's discretion to a certain category of air pollution problems, to the exclusion of others.

Under that interpretation, I cannot find that opponents of the waiver have demonstrated that California does not need its state standards to meet compelling and extraordinary conditions. The opponents of the waiver have not adequately demonstrated that

[123] However, the Alliance presented some evidence at the May 30, 2007 waiver hearing that some temperature reduction may be achieved, based on application of the Wigley equation. EPA–HQ–OAR–2006–0173–0421 at 71.

[124] 74 FR 12156, 12159–60 (March 6, 2008).

[125] *MEMA I* at 1110–11.

[126] California Air Resources Board, EPA–HQ–OAR–2006–0173–0004.

[127] *Massachusetts* v. *EPA,* 59 U.S. 497, 525–526 (2007).

[128] EPA also received comment during the second comment period indicating that a local decrease in GHGs can have a direct effect on reducing local ozone concentrations, as well as particulate matter concentrations, in California, before they mix with other greenhouse gases in the upper atmosphere. The comments that address Dr. Jacobson's testimony do not dispute these atmospheric reactions and the fact that they can increase local temperature which can increase ozone concentrations.

California no longer has a need for its motor vehicle emission program.

Separately, even applying the alternative interpretations set forth in the March 6, 2008 Denial, I cannot find that that the opponents of the waiver have demonstrated that California does not need its greenhouse gas emission standards to meet compelling and extraordinary conditions. Nor can I find that the opponents of the waiver have demonstrated that the impacts from climate change in California are not compelling and extraordinary.

Therefore, upon reconsideration of the March 6, 2008 Denial, I determine that I cannot deny the waiver request under section 209(b)(1)(B).

VI. Are the California GHG Standards Consistent With Section 202(a) of the Clean Air Act?

EPA has reviewed the information submitted to the record of this proceeding to determine whether the parties opposing this waiver request have met their burden to demonstrate that the GHG standards are not consistent with section 202(a). In its submissions, CARB has submitted information and argument that these GHG standards do provide regulated manufacturers with sufficient lead-time for the near term standards regardless of how it is measured and regardless of the waiver denial. For the mid-term standards, CARB has stated that initially, manufacturers can achieve compliance with credits from the near-term production, and subsequently can achieve compliance with refinements to existing technology and advanced technology combinations. The industry opponents of the waiver have submitted information and argument that there is insufficient leadtime for the CARB near-term standards because the already short time-frame for technology development was made even shorter by EPA's waiver denial. For the mid-term standards, the industry stated that it is likely that most large-volume manufacturers will be able to comply with the CARB standards only by ''mix-shifting'' their products to offer for sale more higher mileage vehicles to ensure meeting the CARB fleet average. The industry also submitted information and argument that the GHG standards will result in unsafe vehicles because vehicles meeting the standards will be lighter and more hazardous to occupants in accidents, and will be driven more because of higher fuel efficiency, so more accidents will occur. The industry argued that these complying vehicles are technologically infeasible because of the safety concerns. EPA's analysis of the consistency of the CARB standards with section 202(a) of the Act follows.

A. Historical Approach: The Standard of Review for Consistency With Section 202(a)

Under section 209(b)(1)(C), EPA must deny California's waiver request if the Agency finds that California standards and accompanying enforcement procedures are not consistent with section 202(a) of the Act. The scope of EPA's review under this criterion is narrow. EPA has previously stated that the determination is limited to whether those opposed to the waiver have met their burden of establishing that California's standards are technologically infeasible, or that California's test procedures impose requirements inconsistent with the Federal test procedure.[129] Previous waivers of federal preemption have stated that California's standards are not consistent with section 202(a) if there is inadequate lead time to permit the development of technology necessary to meet those requirements, giving appropriate consideration to the cost of compliance within that time.[130] California's accompanying enforcement procedures would be inconsistent with section 202(a) if the Federal and California test procedures conflict, *i.e.,* if manufacturers would be unable to meet both the California and Federal test requirements with the same test vehicle.[131]

EPA does not believe that there is any reason to review these criteria any differently for EPA's evaluation of California's greenhouse gas waiver request. There is nothing inherently different about how GHG control technologies should be reviewed when making a determination about technological feasibility or consistency of test procedures.

In the GHG waiver proceeding, automobile industry opponents of the waiver have presented evidence for EPA's consideration which they believe will require EPA to make the finding of inconsistency with section 202(a), and therefore require EPA to deny this waiver. They believe this finding should be made on one or more grounds that there is inadequate lead time provided by the CARB standards. EPA's process for evaluating lead time is discussed immediately below. The industry opponents also raise arguments based on the cost of compliance with the standards, and claims of possible significant vehicle safety problems caused, at least indirectly, by compliance with the GHG standards, which will be discussed in other parts of this section.

Regarding lead time, EPA historically has relied on two decisions from the U.S. Court of Appeals for the DC Circuit for guidance regarding the lead time requirements of section 202(a). Section 202(a) provides that an emission standard shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance. In *Natural Resources Defense Council* v. *EPA* (''*NRDC*''), 655 F.2d 318 (DC Cir. 1981), the court reviewed claims that EPA's particulate matter standards for diesel cars and light trucks were either too stringent or not stringent enough. In upholding the EPA standards, the court concluded:

> Given this time frame [a 1980 decision on 1985 model year standards]; we feel that there is *substantial room for deference* to the EPA's expertise in projecting the likely course of development. The essential question in this case is the pace of that development, and absent a revolution in the study of industry, defense of such a projection can never possess the inescapable logic of a mathematical deduction. We think that the EPA will have demonstrated the reasonableness of its basis for projection if it answers any theoretical objections to the [projected control technology], identifies the major steps necessary in refinement of the technology, and offers plausible reasons for believing that each of those steps can be completed in the time available.[132]

Another key case addressing the lead time requirements of section 202(a) is *International Harvester* v. *Ruckelshaus* (''*International Harvester''*), 478 F 2.d 615 (DC Cir. 1979). In *International Harvester,* the court reviewed EPA's decision to deny applications by several automobile and truck manufacturers for a one-year suspension of the 1975 emission standards for light-duty vehicles. In the suspension proceeding, the manufacturers presented data which, on its face, showed little chance of compliance with the 1975 standards, but which, at the same time, contained many uncertainties and inconsistencies regarding test procedures and parameters. In a May 1972 decision, the Administrator applied an EPA

[129] *MEMA I,* 627 F.2d at 1126.

[130] See *e.g.,* 38 FR 30136 (November 1, 1973) and 40 FR 30311 (July 18, 1975).

[131] To be consistent, the California certification test procedures need not be identical to the Federal test procedures. California procedures would be inconsistent, however, if manufacturers would be unable to meet both the state and Federal requirements with the same test vehicle in the course of the same test. See, *e.g.,* 43 FR 32182, (July 25, 1978).

[132] *Natural Resources Defense Council* v. *EPA,* 655 F.2d 318, 331. (emphasis added)

methodology to the submitted data, and concluded that ''compliance with the 1975 standards by application of present technology can probably be achieved,'' and so denied the suspension applications.[133] In reviewing the Administrator's decision, the court found that the applicants had the burden of coming forward with data showing that they could not comply with the standards, and if they did, then EPA had the burden of demonstrating that the methodology it used to predict compliance was sufficiently reliable to permit a finding of technological feasibility. In that case, EPA failed to meet this burden.

With respect to lead time, the court in *NRDC* pointed out that the court in *International Harvester* ''probed deeply into the reliability of EPA's methodology'' because of the relatively short amount of lead time involved (a May 1972 decision regarding 1975 model year vehicles, which could be produced starting in early 1974), and because ''the hardship resulting if a suspension were mistakenly denied outweigh the risk of a suspension needlessly granted.'' [134] The *NRDC* court compared the suspension proceedings with the circumstances concerning the diesel standards before it: ''The present case is quite different; 'the base hour' for commencement of production is relatively distant, and until that time the probable effect of a relaxation of the standard would be to mitigate the consequences of any strictness in the final rule, not to create new hardships.'' [135] The *NRDC* court further noted that *International Harvester* did not involve EPA's predictions of future technological advances, but an evaluation of presently available technology.

EPA also evaluates CARB's request in light of congressional intent regarding the waiver program generally. This is consistent with the motivation behind section 209(b) to foster California's role as a laboratory for motor vehicle emission control, in order ''to continue the national benefits that might flow from allowing California to continue to act as a pioneer in this field.'' [136]

For these reasons, EPA believes that California must be given substantial deference when adopting motor vehicle emission standards which may require new and/or improved technology to meet challenging levels of compliance. This deference was discussed in an early waiver decision when EPA approved the waiver request for California's 1977 model year standards:

> Even on this issue of technological feasibility I would feel constrained to approve a California approach to the problem which I might also feel unable to adopt at the Federal level in my own capacity as a regulator. The whole approach of the Clean Air Act is to force the development of new types of emission control technology where that is needed by compelling the industry to 'catch up' to some degree with newly promulgated standards. Such an approach to automotive emission control might be attended with costs, in the shape of a reduced product offering, or price or fuel economy penalties, and by risks that a wider number of vehicle classes may not be able to complete their development work in time. Since a balancing of these risks and costs against the potential benefits from reduced emissions is a central policy decision for any regulatory agency, under the statutory scheme outlined above I believe I am required to give very substantial deference to California's judgment on that score.'' [137]

EPA has traditionally considered lead time as starting with the date that the rules are adopted and become effective under California state law—not from the subsequent date of a request for a waiver or the decision on a waiver.[138] This is consistent with the structure of section 209(b), where the waiver criteria are presumed to be met absent an affirmative finding that requires EPA to deny it, which gives EPA a limited scope of review and affords deference to California. At the time that California adopts its rules, manufacturers have clear knowledge and are fully on notice of California's requirements and the date when such requirements will be implemented. In this case, the CARB GHG regulations became final and effective in 2004. This was five years before the first phase of compliance (the 2009 model year) and eight years before compliance with the ''mid-term'' standards, which include the most stringent standards (model year 2016). Because of this large amount of lead time available to manufacturers under CARB's regulatory schedule, the approach described in *NRDC* is the most appropriate under the circumstances at issue here.

EPA notes, however, that manufacturers have disputed whether ample lead time exists. Because EPA initially denied this waiver request, manufacturers have asserted that the lead time should have ''tolled'' at the time of the denial, since California could not implement and enforce standards which had not received a waiver. This tolling issue is discussed below in section VI.F.1. Additionally, if the tolling might be considered to cause a reduction in lead time for the CARB near-term standards, it could be argued that the *International Harvester* approach, involving circumstances where the lead time is short, should apply. CARB, while maintaining that the *NRDC* approach is the correct measurement here, commented that even if *International Harvester* was the correct guide, ''we believe that a combination of manufacturers' statements and plans indicated that manufacturers are already in, or with minor changes can demonstrate compliance for the 2009 and 2010 model years.'' [139] Under *International Harvester,* the burden was on the industry to demonstrate that the evidence supported the grant of an extension, then, the burden shifted to EPA to demonstrate the reasonableness of its projection. As discussed below, the manufacturers have not met their burden to show that the California standards are not technologically feasible, considering the lead time provided and cost of compliance.

Under *NRDC,* when compliance with CARB standards is phased-in over a lengthy time period, the reasonableness of a projection of technological feasibility can be based on answering any theoretical objections to the projected control technology; identifying the major steps necessary in refinement of the technology; and offering plausible reasons for believing that each of those steps can be completed in the time available.[140] EPA's review of the evidence on the technological feasibility of GHG technologies follows.

B. CARB's Assessment of the State of Development of GHG Reduction Technology and Comments Supporting CARB's Assessment

1. Development of GHG Reduction Technology

Under the terms of Assembly Bill 1493, which is the legislation that directed CARB to establish greenhouse gas emission standards, the CARB staff was directed to set those standards in a manner that would ''achieve the maximum feasible and cost-effective reduction of greenhouse gas emissions from motor vehicles.'' CARB has

[140] *NRDC,* 655 F.2d 318, 331.

identified four basic areas of GHG reduction technology: (1) Engine, drivetrain and other vehicle modifications; (2) mobile air conditioning system modifications; (3) alternative fuel vehicles; and (4) exhaust catalyst improvements.

To accomplish the assessment mandated by AB 1493, CARB staff held several meetings and workshops in 2003 and 2004 on GHG vehicle technology. Those meetings brought together technology developers, researchers from the auto industry, vehicle component suppliers, academic participants, and vehicle simulation firms to discuss technologies and their potential to reduce climate change emissions from motor vehicles. CARB staff presented its preliminary findings in a draft technology and cost assessment and held a public workshop to receive comments in April 2004. Following that presentation, CARB issued a draft proposal on the methodology for developing the GHG standards and the preliminary standards themselves, in June 2004. A public workshop on this draft was held in July 2004. After considering all the comments from these sessions, CARB published its final staff proposal in the Staff Report: Initial Statement of Reasons (ISOR) in August 2004.[141]

The CARB vehicle technology results in the ISOR relied on an existing vehicle simulation study (discussed below), as well as other existing studies and research, rather than on any sort of primary development or engineering work. CARB staff acknowledged that ''because powertrain changes will be the focus for obtaining the reductions sought in this (GHG) rulemaking rather than aftertreatment technologies, staff could not reasonably build prototypes and test them in our laboratory. * * * Because building and testing prototypes is so expensive, and time consuming, even major automobile manufacturers rely on vehicle simulation firms to predict the performance of new technology either individually or in combination, and to assess their performance and emissions.'' [142] CARB further commented that the advantage of systems modeling ''is to allow a wide diversity of combinations of technologies to be modeled together and examine how they interact when simulating a vehicle operating on various driving cycles.'' [143]

The study forming the basis of the ISOR vehicle technology results was a comprehensive vehicle simulation modeling effort and a thorough cost analysis performed for the Northeast States Center for a Clean Air Future (NESCCAF), by the recognized expert companies AVL Powertrain Engineering, Martec, and Meszler Engineering Services.[144] CARB staff believed that ''the NESCAAF study is the most advanced and accurate evaluation of vehicle technologies that reduce greenhouse gas emissions yet performed.'' [145] Besides the NESCAAF study on vehicle technologies, CARB monitored a separate analysis of the GHG benefits of alternative fuel technologies, including upstream benefits and the cost associated with alternative fuel technologies, from work performed by TIAX, LLC. Finally, for air conditioning research, CARB staff met with various groups (including EPA) to develop its approach for reducing the emissions of air conditioning refrigerant and excess CO_2 emissions from air conditioning use.

After the release of the Initial Staff Report, CARB received comments on its evaluation of technological steps that could be taken to meet its GHG standards from parties who supported the CARB study, and from various industry parties who disagreed with many of the CARB conclusions. As part of its standard-setting process, CARB staff considered the comments from all parties on both sides, and responded to industry concerns in its Final Statement of Reasons (FSOR), published in August 2005.[146] CARB concluded that it had identified the necessary technology in existence at that time that could enable vehicles to meet the GHG standards; or specifically identified the projected control technologies; answered the industry objections regarding the technology; and has explained its reasons for believing that each of the steps can be completed in the time available.

2. Overview of Technologies and Their Projected Applications

The NESCAAF study identified technologies for reducing CO_2 emissions that were modeled both individually and in various technology combinations (or ''packages''). Because there were a multitude of technologies available for the CO_2 reductions, CARB realized that there needed to be engineering guidelines for choosing combinations that would be economical to the consumer. The guidelines tried to avoid combining technologies that tend to address the same categories of losses or technologies that may not complement one another from a drivability standpoint. Participants in the NESCAAF study and CARB staff then assembled a wide variety of combined technologies to evaluate through simulation modeling in order to identify those which would provide the greatest CO_2 reductions. In an effort to cover the full spectrum of CO_2 reductions that could be accomplished, CARB staff divided the results into two categories: near-term phase-in and mid-term phase-in applications. These translate to the following model year ranges: Near-term (2009–2012) and mid-term to fully phased-in (2013–2016).[147]

In the Initial Staff Report, CARB staff summarized the state of near-term technology for meeting its proposed CO_2 standards:

> The technologies explored (in the Initial Staff Report) are currently available on vehicles in various forms, or have been demonstrated by auto companies and/or vehicle suppliers in at least prototype form * * * There is near term, or off the shelf technology package in each of the vehicles classes evaluated (small and large car, minivan, small and large truck) that resulted in a reduction of CO_2 emissions of at least 15 to 20 percent from baseline values. In addition there is generally a near-term technology package in each of the vehicle classes that results in about a 25 percent CO_2 emission reduction.'' [148]

For engines, CO_2 is emitted with engine exhaust as a result of the combustion process. CARB projected that by 2009, reductions in engine CO_2 emissions would result from these primary technology drive-train changes which could be expected in all vehicle classes: Dual cam phasing, turbocharging with engine downsizing, automated manual transmissions, and

[142] *Id.* at 43.

[143] *Id.* at 58.

[144] NESCCAF undertook this study ''to help define GHG—reducing motor vehicle technologies that are expected to be feasible, commercially available and cost effective in the 2009–2015 timeframe.'' It was ''inspired by the California's legislature's passage of Assembly Bill 1493 * * *'' and it related to the Northeast U.S. because ''the results presented in this report have significant implications for states in the Northeast and elsewhere that share California's commitment to reducing transportation related GHG emissions as part of a broader effort to address the risks posed by global climate change.'' Reducing Greenhouse Gas Emissions from Light-Duty Motor Vehicles, NESCCAF, p 1–1, September 2004.

camless valve actuation.[149] CARB also described several other technology items that may not be present in most vehicles in the early years of the standards, but are expected to be used in later years as development continues. These include: Gasoline direct injection, engine friction reduction, aerodynamic drag and rolling resistance, more aggressive shift logic, and early torque converter lock-up. Finally, CARB staff identified two other technology choices that while offering real GHG reduction capability were not as cost effective as the other technologies, and, accordingly, were not projected to be applied in the near-term—these are hybridization and greater dieselization of the fleet.

For the later years of these standards, CARB stressed that its GHG regulations ''rely less on traditional technology-forcing than repackaging a combination of off-the-shelf technologies to meet the adopted standards.'' [150] The NESCAAF Report included, for each of the five vehicle categories, a table showing several promising technology packages, for each of the three time frames (near-, mid-, and long-term), their resulting CO_2 reductions, and expected costs.[151] Additionally, for the long-term phase of the standards (2015–2016), CARB projects that there will be increased market penetration of hybrid-electric vehicles and advanced multi-mode diesel vehicles.[152] In its December 2005 request letter, CARB discussed how improvements will occur, as it expects ''that a manufacturer would plan for a rollout of new technologies that would begin in 2009 and then build on the initial efforts with additional near and mid-term technologies that would be commensurate with previous investments.''[153]

For air conditioning systems, GHG emissions are either direct or indirect. Direct emissions are the result of normal leakage of the air conditioning refrigerant from the system over time, as well as leakages that occur because of vehicle accidents, poorly performed maintenance, or improper refrigerant recovery prior to vehicle scrappage. Air conditioning refrigerants used in vehicles today are typically a hydro-fluorocarbon (HFC), which is a very strong GHG. Indirect emissions are the additional CO_2 emissions from the engine which occur because of the added load on the engine from operation of the air conditioning system. CARB, using the modeling in the NESCAAF Report, projected that CO_2 equivalent reductions could result from these improvements in the air conditioning system: improved variable displacement compressor with revised controls, improved low-leak systems, and the use of an improved refrigerant.[154]

CARB notes that alternative fueled vehicles generally can help reduce GHG emissions by: (1) Direct reduction of GHG emissions because the alternative fuels will produce fewer GHG emissions, and (2) indirect reductions in GHG emissions because of the decreased upstream emissions. Upstream emissions are well-to-tank emissions, including the fuels' extraction, processing, distribution and marketing. The alternative fuels which result in GHG reductions are CNG, LPG, ethanol (including E85), electric, and hybrid-electric.

In its ISOR, CARB identified exhaust catalyst improvement as another technology area that could lead to GHG emission reductions, specifically the reduction of methane and nitrous oxide (N_2O). These gases are greenhouse gases just like CO_2, but their mass emissions from motor vehicles are very small compared to CO_2. CARB notes that ''although it is conceivable that these methane and N_2O emissions could be reduced by faster catalyst heating at vehicle start-up and enhanced catalysts systems with higher surface density or higher and/or revised catalyst loadings, staff is not aware of such efforts at this time (August 2004).'' [155] There were no further submissions to the record by CARB or any other party on this particular technology area.

3. CARB's Updates on Technological Development

At the time of the first set of EPA hearings on the CARB waiver request, in April 2007, CARB presented additional information to bolster its assertions on technological feasibility to highlight developments in GHG technology since CARB originally submitted its request to EPA in 2005. CARB summarized the recent developments and additional examples of real-life implementation of the technologies identified in its waiver request. In its comments following the April 2007 hearings, and its July 2007 letter responding to post-hearing comments, CARB offered additional information to bolster their GHG technology projections. Generally, CARB pointed to numerous instances in which many of the near-term and mid-term technologies have been applied in vehicles which have been produced in the years since 2004 (when the CARB standards became final) right up to mid-2007. For example, attached to additional comment letters it submitted to EPA's Docket in June and July 2007, CARB discussed the increased use of the GHG technologies discussed in the ISOR and provided summaries of GHG technology used in 2007 and 2008 model year vehicles showing increased use of all the near-term and mid-term technologies.[156] CARB also offered numerous examples, contained in manufacturer news releases and advertisements, and trade press stories, illustrating real-life adoption of the GHG technologies in both domestic and foreign manufacturers' vehicles.[157]

At its March 5, 2009 hearing following EPA's decision to reconsider its previous denial, CARB presented additional new information highlighting developments in GHG technology since the last opportunity to submit public comment on this issue. In addition, some environmental groups submitted testimony and comments in support of the CARB finding of technological feasibility of the GHG standards. This next section will summarize the technological feasibility information submitted by CARB and other parties. CARB noted that the manufacturers were employing the individual GHG-reducing technologies as well as the packages of those technologies CARB had projected as viable compliance pathways as early as 2004. CARB also noted that in addition to phasing-in technologies, as CARB had originally predicted, manufacturers were using other technologies that CARB did not rely on originally—including increased hybrid sales, downsized turbocharged engines in light truck lines, a large influx of diesel vehicle sales, and improved air conditioning systems. In some cases, the resulting reductions produced as much as 10% of the GHG reductions needed for manufacturers' fleet averages to meet the CARB standards.

CARB also cited to recent EPA studies on technological feasibility and costs for

GHG reductions in motor vehicles, conducted by EPA in 2007. These EPA reports were discussed in EPA's Advanced Notice of Proposed Rulemaking on Regulating Greenhouse Gas Emissions Under the Clean Air Act published on July 30, 2008.[158] The findings in these studies were very consistent with the technological feasibility, cost and lead time estimates from the CARB ISOR in 2004.

Three EPA studies were referenced by CARB. First, CARB discussed the June 2008 document ''Vehicle Technical Support Document: Evaluating Potential GHG Reduction Programs for Light-Duty Vehicles (Light-Duty Vehicle TSD).'' [159] The Light-Duty Vehicle TSD represented EPA's assessment during 2007 of how a light-duty vehicle program for GHG emission reductions under the Clean Air Act might be designed and implemented, with two program options: either (1) a fixed percentage reduction (4%) in CO_2 emissions per model year from 2011 to 2018, or (2) an annual reduction in CO_2 emissions per model year from 2011 to 2018, based on a model developed by the Department of Transportation's Volpe Center, establishing CO_2 emission standards, at the point the model projects maximum net benefits for those model years.[160] The Light-Duty Vehicle TSD collected information from a wide range of sources, including a 2002 National Academy of Sciences report, the 2004 NESCAAF report (also used by CARB), current technical literature, and information from vehicle manufacturers and automotive suppliers. CARB noted that the emission reduction potentials and costs in the EPA study were similar to the reduction potentials and costs estimated by CARB in its ISOR. In discussing the Light-duty TSD in the ANPRM, EPA also acknowledged that, based on enhancements to the Volpe Model later in 2007, the earlier EPA analysis ''tended to underestimate the benefits and/or overestimate the costs of light-duty vehicle CO_2 standards that could be established under the CAA.'' [161]

CARB also referenced the March 2008 ''EPA Staff Technical Report: Cost and Effectiveness Estimates of Technologies Used to Reduce Light-duty Vehicle Carbon Dioxide Emissions.'' This report presented the EPA staff assessment of costs and effectiveness of over 40 CO_2 reduction technologies in the categories of engines, transmissions, hybrids, accessories and other technologies (*e.g.,* aerodynamic improvements). EPA noted that the majority of the technologies investigated are in production and available on current vehicles, either in the U.S., Europe or Japan. As part of that report, EPA worked with an internationally recognized automotive technology firm to perform a detailed vehicle simulation modeling study of the GHG reduction effectiveness of a number of advanced automotive technologies. As noted by CARB, the EPA Report obtained technology package reductions and cost estimates very similar to those in the CARB ISOR.[162] As in the earlier Light-Duty TSD, EPA noted that the estimates in this report are conservative because they rely on data sources from one to six years old and declared that the ''automotive industry is a technology-driven industry, and new technologies are developed and introduced quickly. A number of technologies which have only recently been introduced or will be within the next year are likely to see improvements in their effectiveness and cost reductions beyond what we estimate (in this report).'' [163]

Finally, CARB referenced an EPA staff technical memorandum ''Documentation of Updated Light-duty Vehicle GHG Scenarios,'' dated June 23, 2008.[164] This memorandum summarized the staff work to update the ''4% per year'' GHG reduction scenario that was first documented in the Light-duty Vehicle TSD, by addressing some of the deficiencies of the earlier study,[165] and was discussed in the ANPRM for GHG Standards. EPA once again noted that because the updated analysis did not address all the issues identified in the earlier TSD, it continued to believe that the results of this updated analysis are conservative, tending to overestimate the costs and/or underestimate the benefits. In its most recent comment, CARB noted that the EPA lead time estimates in EPA's ANPRM cite implementation rates supportive of CARB's estimates for implementing vehicle GHG reducing technologies.[166]

CARB summarizes the reports from EPA, NESCAAF and others by declaring that ''the technologies examined are well known and most are already being implemented on today's vehicles, while the others are simply advanced versions of conventional technologies that are already being demonstrated by vehicle manufacturers and component suppliers.'' [167] To bolster this statement, CARB submitted a list of Model Year 2009 vehicles which employ GHG reduction technologies, which shows a gradual phasing-in of these technologies across all manufacturers and all product lines. CARB also submitted a list showing 2009 Model Year vehicles that comply with the CARB GHG standards; the list shows significant numbers of 2009 passenger cars and light trucks meeting the 2012 and later standards, significantly ahead of the deadlines.

With respect to the overall technological feasibility of its GHG standards, CARB believes that it has reasonably projected technological feasibility, consistent with the approach employed in the *NRDC* decision, when manufacturers have several years of lead time before compliance. CARB notes that it ''either has demonstrated that the necessary technologies presently exist to meet the established standards or we have specifically identified the projected control technologies, answered objections raised by industry regarding those technologies, and explained why we believe that each of the steps can be completed in the time available.'' [168]

In support of its conclusion, CARB submitted for the record three analyses showing that the manufacturers are employing the GHG technologies at least as fast as CARB predicted, and certainly in time for compliance with the early model years. First, CARB did an ''industry-wide'' projection using manufacturers' 2009 sales projections and worst case CO_2 values per single test vehicle, and used the 2009 projected sales as unchanged for 2010 and 2011 model years.[169] The results of this analysis show industry-wide GHG

[158] Advanced Notice of Proposed Rulemaking, Regulating Greenhouse Gas Emissions Under the Clean Air Act, 73 FR 44354 (July 30, 2008).

[159] California Air Resources Board, EPA–HQ–OAR–2006–0173–9019.5.

[160] This approach uses a computer model developed by the Department of Transportation Volpe Center called the ''CAFE Effects and Compliance Model'' (''Volpe Model'').

[161] This EPA assessment of the Light-Duty Vehicle TSD was contained in the Advanced Notice of Proposed Rulemaking, Regulating Greenhouse Gas Emissions Under the Clean Air Act, 73 FR 44354, at 44444 (July 30, 2008).

[169] California Air Resources Board, EPA–HQ–OAR–2006–0173–9019.12.

credits for 2009 and 2010 and a debit for 2011, but an overall credit for the three-year period. CARB noted that because this was done on a worst-case testing basis, it is likely that testing with additional vehicles in each test group would show even the debiting companies in compliance.[170]

Second, CARB looked at the compliance projection for the major domestic manufacturers (Ford, GM and Chrysler) for the 2009 and 2010 model years.[171] CARB used the actual 2009 model year registration data (from Polk) and, then, applied CO_2 emissions data by vehicle model obtained from EPA, selecting the highest CO_2 emissions data for those vehicle models with multiple engines. The results showed that for the 2009 model year, GM and Ford have ample compliance margins for both PC/LDT1 and LDT2/MDV, while Chrysler has a debit for its PC/LDT1 fleet, but a wide margin for its LDT2/MDV fleet. The overall net result is compliance for all three companies. For 2010, the three companies run debits for PC/LDT1 but have compliance margins for LDT2/MDV (a small margin for GM, and substantial margins for Ford and Chrysler). Again, based on the use of accumulated credits, these companies would comply with the model years analyzed.

Third, CARB focused on just GM for the 2009 model year, using a different technique than their study directly above.[172] CARB used certification data provided by GM, projected sales based on GM's latest manufacturer update to CARB, and CO_2 results provided by EPA. Then each GM certification test group was divided by GM into sales sub-groups, each having one or several vehicle models. For each sub-group, the CO_2 emissions of the highest emitting model were multiplied with the total number of vehicles in the subgroup to calculate the sub-group's GHG value. The GHG values from all sales subgroups in a test group were summed up to represent the sales group GHG value. For the 2009 model year, under this analysis, the GM PC/LDT1 fleet over-complies by 14 grams per mile and the LDT2/MDV fleet over-complied by 27 grams per mile, generating substantial credits for 2010 and beyond.

Additional support for 2009–2011 compliance was provided by the Natural Resources Defense Council. At EPA's March 5, 2009 waiver hearing, NRDC presented testimony regarding the technological feasibility of the GHG standards for the early years of compliance. NRDC performed its analysis by using EPA fuel economy trends data for MY 2008, which predicted a national average fuel economy level without CAFE credits for flexible fuel vehicles. NRDC then converted the miles per gallon numbers to CO_2 grams per mile levels using the California sales mix and the GHG conversion established by CARB. The result is that industry accrues substantial amount of credits in 2009 and 2010, and then runs a small deficit in 2011 that can be easily made up using banked credits from the first two years.[173]

Beyond submitting results from its own recent analyses, CARB submitted a very recent (March 2009) study by Energy & Environmental Analysis (EEA) entitled ''Automakers Ability to Comply with California GHG Standards Through 2012.''[174] The EEA study notes that, if the California waiver is granted, manufacturers would be required to comply with standards for MY 2009 vehicles, which are already in production and being sold, and would have very little lead time to make changes for MY 2010 (which will start production in mid-calendar year 2009), and limited opportunity to make changes at this point for MY 2011 and 2012. EEA looked at the product plans for the ''Big Six'' manufacturers in the U.S. (GM, Ford, Chrysler, Toyota, Honda and Nissan) based on commercially available data, and from public information reported in the trade press, as well as the information submitted by the manufacturers to the Federal government in connection to the auto restructuring plans.[175] Generally, because of projected large sales of hybrids and to a lesser extent, sales of diesel vehicles, EEA projected that Toyota and Honda will meet California GHG standards through 2012, and that Nissan may have a shortfall in LDV/LDT1 for 2012, but will easily comply with LDT2/MDV in 2012, and will be able to meet the 2012 standards by trading between categories and using banked credits from prior years.

For the domestic manufacturers, EEA noted concerns about compliance with the California GHG standards, in part because these companies have Federal CAFE values which are significantly below the three Japanese companies, meaning that it will be harder for them to reach the target. Nevertheless, the EEA report noted that the product plans of these companies show the following industry-wide technology improvements coming on line in the next 4 to 5 years:

—Luxury vehicles adopting GDI across most product lines;
—4 valve OHC/DOHC engines with VVT replacing the few remaining 2-valve OHC 4 and 6 cylinder engines;
—6-speed transmissions replacing 4 or 5 speed units in most mass market vehicles
—Electric power steering replacing hydraulic units in compact and mid size cars;
—Cylinder cut-out applications to V–8 and some V–6 units;
—Variable valve lift used more widely by Japanese manufacturers;
—Introduction of several new diesel models and hybrid models by all manufacturers;
—Introduction of new small ''crossover'' SUV and car models that are one size class below the existing smallest models offered by the domestic manufacturers to compete with the Toyota Scion XD and XB models and the Honda Fit model.

To perform the GHG estimate, the EEA study used the actual fuel economy data by vehicle model for MY 2009, and used the product-plan based technology forecasts to derive fuel economy by model for MY 2010 through 2012. For sales numbers, EEA used 2008 sales data and sales for the first two months of 2009 both nationally and for California as sales indicators for the near term (MY 2009 and 2010). For 2011 and 2012, EEA used the sales forecast it had developed in the 2008 DOE study, which was a 15 million annual sales level of light duty vehicles nationally. The power train mix numbers (engine/transmission combinations) for all years were the 2008 numbers because this was the latest data available from the CAFE data base.

Using this approach, EEA found that all three domestic manufacturers are in

[170] California Air Resources Board, EPA–HQ–OAR–2006–0173–9006 at 24.

[171] California Air Resources Board, EPA–HQ–OAR–2006–0173–9019.13. CARB limited this particular analysis to the domestic manufacturers because, in its assessment, ''the international auto companies are better positioned to comply and will unquestionably meet early model year standards.'' As summarized in the first (industry-wide) CARB analysis, although at least one international manufacturer (BMW) projected a slight debit for 2009, all the manufacturers were projected for overall compliance for the period 2009–2011.

[172] California Air Resources Board, EPA–HQ–OAR–2006–0173–9019.14.

[173] Natural Resources Defense Council, EPA–HQ–OAR–2006–0173–7176.13, at 5–6. The NRDC testimony also noted that developments in the period between the first waiver hearing (May 2007) and the new hearing strengthen the California case that the GHG standards are cost-effective and technically feasible—namely, higher gas prices, the market shift to cleaner cars and the passage of new Federal fuel economy standards.

[174] California Air Resources Board, EPA–HQ–OAR–2006–0173–9019.15.

[175] EEA completed a detailed study of product plans for the Big Six manufacturers for the U.S. Department of Energy in late 2008, and they used that study as a baseline for this report on California GHG compliance.

compliance with current and expected CAFE through 2012, with Chrysler lagging somewhat behind Ford and GM. EEA then translated these forecasts to GHG forecasts for the California vehicle class definitions, assuming no A/C improvement credits or alternative fuel credits, and no trading of credits between manufacturers, and predicted as follows:

—All manufacturers will comply with GHG requirements for 2009;
—GM and Chrysler will comply with GHG regulation in 2010 while Ford is on the edge of compliance. Ford can likely comply by either using banked credits from 2009 or with small adjustments to the power train and sales mix sold in California if necessary;
—Chrysler and GM may be able to meet 2011 GHG standards using banked credits from 2009 and 2010 and credit trading between classes. All three manufacturers could require additional efforts such as air conditioner improvements to comply with 2011 GHG requirements.
—Compliance with 2012 GHG requirements will be a challenge and may require credit trading and banked past and future credits over and above credits from air conditioner improvements and introduction of alternative fuel vehicles.
—The results appear to be very realistic based on the auto-manufacturers public statements of future fuel economy.[176]

Regarding the long-term (MY 2012 and later) outlook, CARB compared the restructuring plans submitted by the automakers to the arguments manufacturers made in this proceeding, regarding later model year feasibility. CARB stated that ''by 2015, even those manufacturers facing the most difficult challenge complying with California's standards have made statements that on their face show they plan to comply with the later model years standards, even before receiving additional credit for GHG reductions from air conditioning improvements and regardless of 2009 and 2010 credits carrying forward.'' [177] For example, CARB cited from the GM restructuring plan that the company stated that it will work to develop any changes needed to * * * meet such additional requirements as California's.[178] Further, at EPA's March 5, 2009 hearing, NRDC pointed out that the plans of both GM and Ford show MY 2012 fuel economy levels for cars and light trucks fleet average that come very close to allowing the automakers to comply with the GHG standards with little or no additional effort.[179] Additionally, CARB noted that Chrysler stated that, should this GHG waiver be granted, the company would try its best to comply using available technology; however, as a last resort it might restrict sales of certain vehicle models in California and other states adopting the California standards, out of necessity.[180] Finally, regarding Ford, NRDC stated in its testimony that Ford plans to improve the average fuel economy by 26 percent by 2012 and by 36 percent by 2015.[181]

4. Manufacturers' Comments on the Technological Feasibility of the GHG Standards

Manufacturers raised arguments regarding the feasibility of the CARB GHG standards both in the underlying rulemaking in California, and in the EPA waiver proceeding. In the CARB rulemaking, the manufacturers generally criticized some aspects of the CARB modeling work that substantiated CARB's conclusions on technological feasibility. For example, a manufacturer argued that CARB overestimated the emission reductions from the powertrain changes in many of the technology packages used in the modeling studies, such as the NESCAAF study. Because the studies assumed changes in the use of advanced transmissions and engines in such a magnitude to be unrealistic for the U.S. fleet, the manufacturer stated that the changes would require retooling of all U.S. driveline plants, perhaps more than once.[182] Manufacturers also argued that the modeling of technology packages risked ''double-counting'' emission benefits produced by the individual technologies, thus producing an unrealistic estimate of emission reductions.[183] CARB responded to these comments by stating that manufacturers were already planning to incorporate advanced transmissions and engine technologies in their vehicles, and that the gradual phase-in of the CARB standards allowed manufacturers to accomplish this during regular scheduled vehicle upgrades. CARB also noted that its modeling done by AVL specifically avoided double-counting (while some manufacturers' modeling did not).

Regarding the EPA waiver proceeding, while the manufacturers did take issue with some of the CARB modeling work during the CARB rulemaking, the manufacturers did not challenge CARB's general conclusions that the necessary technology presently exists to meet the near-term standards, that projected control technologies for future years have been identified, and that objections raised by industry have been answered. Rather, the industry offered an assessment that much of this technology is already at hand. At the first EPA hearing in March 2007, although no individual manufacturer presented testimony, the Alliance of Automobile Manufacturers discussed the progress of the industry in producing more fuel-efficient vehicles. The Alliance stated that ''every model available today is equipped with some kind of fuel efficient technology, including direct fuel injection, variable valve timing, continuously variable transmissions, cylinder deactivations, and more.'' [184] These technologies in the 2007 and 2008 MY vehicles are among those that CARB projected as being in use for the near-term GHG standards (see above discussion on ''Overview of Technologies and Their Projected Applications,'' section VI.B.2).

In comments sent to EPA after the March 2007 hearing, the industry commenters focused on whether there was adequate lead time to comply with the near-term standards, citing testimony from a CARB official (in the Vermont litigation) that some manufacturers may need up to six years to comply with the 2011 MY standards and up to 7 years to comply with the 2012 MY standards.[185] Also, the industry criticized CARB for not providing sufficient information on some technology issues for the EPA (or the public) to make an informed decision.[186] CARB responded to these

[186] Alliance of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–1297.2 at 35–36.

points, stating that the CARB official also testified that most of the CARB-identified technologies are already developed and required only a few years of lead time for implementation. Additionally, based on lead time beginning at the time of the final adoption of the standards by CARB (August 2005), CARB notes that the 6 or 7 year lead time for the 2011 and 2012 model years respectively is reasonable.[187] CARB also provided, in its June 2007 and July 2007 comments, information from the Vermont litigation where various manufacturers testified that they would be able to meet the early years of the California GHG standards.[188] Concerning the list of technical issues on which the industry claimed CARB had not provided enough information to allow public comment, CARB stated that these issues were among many issues previously addressed fully both in submissions to the Docket (primarily the CARB Final Statement of Reasons) as well as in the Federal litigation.[189]

Manufacturers also presented information on technological feasibility at EPA's March 5, 2009 hearing and the subsequent comment period. At the EPA hearing, the Alliance continued to acknowledge technological advances in GHG control. The Alliance stated that ''automakers have made major contributions into developing new fuel efficient technologies and the results are now coming to dealer showrooms. More than 50 technologies offered in vehicles today reduce emissions, increase mileage and allow vehicles to run on cleaner fuels.'' [190] Regarding technological feasibility for the early years (near-term), the industry trade groups generally argued that CARB relied on manufacturer credits for these years to provide a cushion for compliance in the later years, but that the several years of lead time required for mid-term compliance combined with uncertainty resulting from the EPA waiver denial makes even the near-term lead time inadequate.[191] CARB, in its testimony and subsequent comments, presented its new analyses of compliance (for the industry in general, and for GM) that showed industry compliance is likely if not certain for the 2009 through 2011 model years (see discussion above at section VI.B.3.). Additionally, if any individual manufacturers incur a debit in any model year, the CARB regulations provide the manufacturer up to five model years afterwards to make up the debit to avoid any noncompliance penalty.

Regarding the mid-term (2012–2016) model years of the GHG standards, the industry commenters have argued that the only means by which most large-volume manufacturers will be able to meet the CARB standards is by ''mix-shifting'' their product lines to offer for sale more higher mileage vehicles to ensure meeting the CARB fleet average.[192] The Alliance stated that ''it is simply too late for manufacturers to meet all the Pavley standards for future model years through the use of technologies, if for no other reason than because approximately 18 months of the product planning and development cycle was pretermitted while the waiver was denied (assuming for purposed of this analysis that a waiver would be granted in June 2009).'' [193] As discussed earlier, CARB responded to these arguments by noting that in the restructuring plans recently submitted to the government, the manufacturers have made statements demonstrating they plan to comply with the later model years of the CARB standards, even before receiving additional credit for GHG reductions from air conditioning improvements and regardless of 2009 and 2010 credits carrying forward. Regarding the manufacturers' mix-shifting argument, EPA notes that under the narrow standard of review applied to California's technological feasibility determinations, consistency with section 202(a) does not mean that all manufacturers will be able to sell all vehicle models in California and that a reduced product offering in California resulting from California emission standards is a policy decision left to the state.[194]

C. Technological Feasibility and the Cost of Compliance

1. Historical Approach

Congress has stated that the consistency requirement of section 202(a) relates to technological feasibility.[195] Section 202(a)(2) states, in part, that any regulation promulgated under its authority ''shall take effect after such period as the Administrator finds necessary to permit the development and application of the relevant technology, considering the cost of compliance within that time.'' Section 202(a) thus requires the Administrator to first review whether adequate technology already exists, or if it does not, whether there is adequate time to develop and apply the technology before the standards go into effect.

In *MEMA I,* the court addressed the cost of compliance issue at some length in reviewing a waiver decision. According to the court:

> Section 202's cost of compliance concern, juxtaposed as it is with the requirement that the Administrator provide the requisite lead time to allow technological developments, refers to the economic costs of motor vehicle emission standards and accompanying enforcement procedures. *See* S. Rep. No. 192, 89th Cong., 1st Sass. 5–8 (1965); H.R. Rep. No. 728 90th Cong., 1st Sass. 23 (1967), *reprinted in* U.S. Code Cong. & Admin. News 1967, p. 1938. It relates to the timing of a particular emission control regulation rather than to its social implications. Congress wanted to avoid undue economic disruption in the automotive manufacturing industry and also sought to avoid *doubling or tripling* the cost of motor vehicles to purchasers. It, therefore, requires that the emission control regulations be technologically feasible within economic parameters. Therein lies the intent of the cost of compliance requirement.[196]

Previous waiver decisions are fully consistent with *MEMA I,* which indicates that the cost of compliance must reach a very high level before the EPA can deny a waiver. Therefore, past decisions indicate that the costs must be excessive to find that California's standards are inconsistent with section 202(a).[197] It should be noted that, as with other issues related to the determination of consistency with

[187] California Air Resources Board, EPA–HQ–OAR–2006–0173–3601, at 26–27.

[188] CARB referenced the industry assessments of early model year compliance from the litigation in Vermont, *Green Mountain Chrysler-Plymouth Dodge-Jeep* v. *Crombie,* 508 F. Supp, 295 (D. Vt.), California Air Resources Board, EPA–HQ–OAR–2006–0173–1686 at 20–21, California Air Resources Board, EPA–HQ–OAR–2006–0173–3601, at 27–28.

[189] The list of issues and the CARB response are discussed in the CARB July 2007 letter. EPA–HQ–OAR–2006–0173–3601, at 26.

[190] Testimony of Association of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–7177, at 108.

[192] Regarding mix-shifting, the National Automobile Dealers Association also commented that this would be costly to dealers who would lose business due to the ''scrappage effect'' (see above pp 46–49), being forced to accept smaller vehicles regardless of local consumer demand, rationing of larger vehicles, and out-of state dealers unencumbered by CARB's regulations. National Automobile Dealers Association, EPA–HQ–OAR–2006–0173–8956.1, at 8–9.

[193] Association of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–8994.1 at 26.

[196] *MEMA I* at 1118 (emphasis added). *See also id.* at 1114 n. 40 (''[T]he 'cost of compliance' criterion relates to the timing of standards and procedures.'').

[197] *See, e.g.,* 47 FR 7306, 7309 (Feb. 18, 1982), 43 FR 25735 (Jun. 14, 1978), and 46 FR 26371, 26373 (May 12, 1981).

section 202(a), the burden of proof regarding the cost issue falls upon the opponents of the grant of the waiver.

Consistent with *MEMA I,* the Agency has evaluated costs in the waiver context by looking at the actual cost of compliance in the time provided by the regulation, not the regulation's cost-effectiveness. Cost-effectiveness is a policy decision of California that is considered and made when California adopts the regulations, and EPA, historically, has deferred to these policy decisions. EPA has stated in this regard, ''the law makes it clear that the waiver request cannot be denied unless the specific findings designated in the statute can be made. The issue of whether a proposed California requirement is likely to result in only marginal improvement in air quality not commensurate with its cost or is otherwise an arguably unwise exercise of regulatory power is not legally pertinent to my decision under section 209 * * *'' [198] Thus, under the language of section 202(a)(2), EPA will look at the compliance costs for manufacturers in developing and applying the technology with the costs being broken down on a cost per vehicle or unit basis.

2. Technology Cost Information in This Proceeding

At the time of CARB's original waiver request, CARB presented the projected technology costs for the GHG vehicle standards based on cost estimates for necessary components provided by Martec, the company that did the modeling studies that produced the CARB technology assessment in its ISOR. The costs were calculated by applying a mark-up factor, determined by the Argonne National Laboratory, for the components needed for the vehicles. Additionally, CARB assumed an additional 30% discount for a limited number of components where unanticipated improvements in production processes or simplifications or consolidation in parts after additional further development would be likely.[199]

At that time, CARB stated that the average cost of control for near-term technology packages on PC/LDT1 category vehicles was estimated at $383 per vehicle, and for LDT2/MDV category vehicles was estimated at $327 per vehicle. Performing similar calculations for the mid-term technology packages, CARB put the estimates for PC/LDT1 at $1,115, and for LDT2/MDV at $1,341. CARB also presented information on the estimates of costs for the ''major 6'' manufacturers cost of compliance over the term of these standards. These figures ranged from $0 (for the three Japanese companies and GM) for the 2009 MY (*i.e.,* the fleets of these companies would comply with the 2009 standards with no changes) to the highest costs in the 2016 MY, with a $1,288–$1,341 range for the domestic manufacturers and a $272–$298 range for the Japanese manufacturers.

During the CARB GHG rulemaking, the manufacturers commented that CARB underestimated costs of individual technologies because CARB did not use the manufacturers' costs to individually develop each of the technologies, and CARB used a mark-up factor for final technology cost that was too low. The Alliance commissioned a study by Air Improvement Resources, NERA Economic Consulting, and Sierra Research (the above noted ''June 2007 AIR/NERA/Sierra Study'') that found the average vehicle cost increase to be about $3000, several times larger that the CARB estimates. In response, CARB provided a detailed critique of why the cost conclusions in this study were not reasonable. CARB found faulty technical analysis and inflated component costs.[200] In the time period since the CARB request, CARB has updated its technology cost estimates with new real-life information to show that manufacturers are continuing to implement the GHG technology packages and combinations CARB had identified at the outset—at costs in line with CARB's projections.[201]

EPA also received comments from the National Auto Dealers Association (NADA) and the National Association of Minority Automobile Dealers (NAMAD) concerning the costs of the CARB standards to its constituents, above the costs that GHG technology adds to the vehicle price to buyers. NADA notes that because of ''dire financial straits'' in the auto industry due to the economic recession, dealers are experiencing financial difficulties from vastly reduced vehicle sales (among other problems). NADA believes that if this waiver is granted, and the various other states which have adopted the GHG standards begin their own programs, the result will be a ''state-by-state patchwork approach to fuel economy that would fill their lots with more unsold vehicles.'' [202] NAMAD believes that ''dealer will lose sales if automakers have to ration delivery of large vehicles in CARB (Section 177) states to meet the fleet average, and * * * if dealers are forced to take delivery of more small cars that their customers don't want, dealers will be stuck paying the interest charges while these vehicles sit on their lots.'' [203] EPA notes the comments of NADA and NAMAD on this particular type of cost, but also notes that these comments are not relevant to the issue of whether the technology feasibility of the GHG standards are consistent with section 202(a). The comments regarding the ''patchwork'' of the GHG standards in other states are discussed below in section VII. B. 2.

3. Consistency of Certification Test Procedures

The enforcement procedures that accompany California's greenhouse gas standards would also be inconsistent with section 202(a) if the California test procedures impose testing requirements inconsistent with the Federal testing requirements. Such inconsistency means that manufacturers would be unable to meet both the California and the Federal test requirements with the same test vehicle.[204]

CARB stated in its December 2005 Waiver Request letter that there ''are no Federal test procedures that measure GHG for climate change purposes, [so] there are no potential inconsistencies precluding a manufacturer from using the same test vehicle to meet both Federal and California requirements'' and noted in its most recent (April 2009) comment letter that this was still true.[205]

EPA received no comments suggesting that CARB's GHG testing requirements pose a test procedure consistency problem with federal test procedures.

4. Safety Implications of the CARB GHG Standards

The industry raised a vehicle safety issue for consideration within the technological feasibility criterion. The industry has proffered the idea that the CARB GHG standards will result in the production of vehicles which will be unsafe for two reasons. First, they claim

[198] 36 FR 17158 (August 31, 1971). *See also* 40 FR 23102, 23104; 58 FR 4166 (January 7, 1993), LEV Waiver Decision Document at 20.

[204] *See, e.g.,* 43 FR 32182 (Jul. 25, 1978).

[205] California Air Resources Board, EPA–HQ–OAR–2006–0173–0004.1 at 42 and EPA–HQ–OAR–2006–0173–9006 at 29.

that many GHG-compliant vehicles will achieve compliance because they will be downsized, and will be inherently less safe in collisions. Second, they claim that because GHG-compliant vehicles will also have higher fuel economy than today's fleet, owners will drive more, and that additional VMT means more accidents will occur. The industry asserts that because the GHG standards will cause these problems, the resulting vehicles are technologically infeasible because of the safety concerns.

EPA takes safety into account in evaluating technology, feasibility and lead time of California emission standards. For example, when CARB in 1994 requested authorization for its original set of emission standards for small spark-ignition engines used in utility, lawn and garden equipment, the industry trade association raised safety concerns in the EPA authorization proceeding. The industry argued that compliance with the CARB standards would require the use of catalyst technology in equipment, and that current catalysts produced high exhaust and surface temperatures, and could also possibly cause sparking and flaming, so these safety issues must be addressed before this technology could become feasible, and the authorization should be denied on that basis. EPA examined these safety issues within the traditional consistency with section 202(a) criterion, with the requisite deference given to CARB and the burden placed on those arguing that safety concerns should give cause for EPA to deny the authorization. CARB responded to the industry objections by offering a detailed review of steps necessary to refine small engine catalyst technology to meet the standards while reducing the high temperature risks, as well as identifying some current small engines that met the standards without using a catalyst. After reviewing all relevant information from CARB and other commenters on the safety issues (and other technological feasibility issues) the Administrator stated he was "unable to make the finding that the CARB Tier 2 standards are not technologically feasible within the available lead time." [206]

In the California GHG proceeding, CARB has responded to the industry safety arguments, both during the underlying California rulemaking and in comments submitted to EPA in this waiver proceeding. In summary, CARB rejected the industry arguments in several ways. First, it pointed out that under the terms of AB 1493, CARB is precluded from requiring vehicle down-weighting as a means of achieving compliance. Second, CARB has laid out a broad pathway of potential technologies for achieving compliance for all vehicle types, none of which require any weight reduction of vehicles. Third, CARB notes that an industry study (Sierra 2004) shows that weight reduction is far from cost-effective and therefore becomes an unlikely compliance option. Fourth, CARB submitted reports from experts that tend to dispute any safety impacts from the GHG standards by demonstrating that any weight reduction that may be made to comply with the GHG standards need not adversely affect vehicle safety. Finally, the opponents VMT safety theory is entirely based on their flawed rebound and fleet turnover arguments (discussed above in section IV.C.2).

Regarding the safety issue, EPA notes that CARB has provided considerable evidence that its GHG standards can be met without any increase in concern regarding vehicle safety. Even accepting the industry arguments regarding the safety implications of downsizing—which are disputed by CARB, particularly for downsizing of larger vehicles—EPA cannot make the finding that the CARB standards are technologically infeasible because manufacturers may choose to use a method of compliance that is not as safe as the methods CARB has identified, particularly where there are many business reasons for manufacturers not to choose such a method. The burden, here, is on manufacturers to demonstrate that safety concerns with the technology available for compliance were unavoidable and substantial and that manufacturers would have no reasonable technological option available to them in the lead time provided for compliance. Based on the entire record, they have not made such a demonstration. Beyond this limited type of review under section 209(b), EPA's proper role is to leave for California the judgment of what greenhouse standards are appropriate in light of safety concerns raised by manufacturers.

With regard to the claim that increased VMT will increase the number of accidents, this argument is not relevant to the safety of the vehicle but to an outcome based on the possible actions or changes of driving patterns of people who own these vehicles. This argument does not go to the technological feasibility of the vehicle itself. This is a public policy argument that is left for California's discretion but is not relevant to the narrow technological feasibility analysis authorized for EPA under section 209(b).

For these reasons, EPA finds that the industry opponents of this waiver request, with respect to the vehicle safety impact of the CARB GHG standards have not met their burden of proof for EPA to find that these standards are not consistent with section 202(a) of the Act.

E. Conclusion on Technological Feasibility

After its review of the information in this proceeding, EPA has determined that CARB has demonstrated a reasonable projection that compliance with its GHG standards is reasonable, based upon the current and future availability of the described technologies in the lead-time provided and considering the cost of compliance. The industry opponents have not met the burden of producing the evidence necessary for EPA to find that California's GHG standards are not consistent with section 202(a).

With regard to motor vehicles required to meet the near-term standards for the 2009 through 2011 model years, the CARB technical information presented in this record clearly indicates that these requirements are feasible. CARB has presented the case that the industry as a whole will be able to meet these standards for this period—for the 2009 and 2010 model years—with compliance with the standards including credit generation, and for the 2011 model year—with a carry-forward of credits earned in the 2009 and 2010 model years. Within the industry, several manufacturers are not expected to need credits to comply in the 2011 model year. Moreover, California has provided several technological avenues that are currently available for meeting the 2011 MY standards without the need for credits. Manufacturers have provided no evidence that these technologies cannot be applied to meet the 2009–2011 MY standards.

For the mid-term standards, 2012 MY and beyond, CARB again identified various and reasonable technological avenues that manufacturers could use to meet the mid-term standards. CARB initially presented that the continued use of technologies identified for the near-term along with more sophisticated technologies and the expected upswing in hybrid-electric and diesel vehicles would result in industry compliance for these years. In its June 2007 comments,

[206] Decision Document, Authorization of California's Under 25 Horsepower Utility Lawn and Garden Equipment Engine Exhaust Emission Standards (ULGE) (July 5, 1995), EPA Docket A–91–01 at 61–70.

CARB noted that it expected manufacturers to use combinations of the initially introduced technologies to meet the mid-term standards and cited several examples of this already happening in several manufacturers' products. CARB also noted that in 2007, manufacturers were aggressively introducing new hybrid vehicles well ahead of the mid-term standards. For the longer term, as noted earlier, CARB states that ''by 2015, even those manufacturers facing the most difficult challenge complying with California's standards have made statements that on their face show they plan to comply with the later model years of standards, even before receiving additional credit for GHG reductions from air conditioning improvements and regardless of 2009 and 2010 credits carrying forward.'' [207]

In its comment submitted after EPA's March 5, 2009 hearing, CARB summarized the industry discussion on technological feasibility as follows:

> In our July 24, 2007 comments CARB stated ''* * * not a single manufacturer from either the Alliance or AIAM has independently presented any substantive comment concerning the principal and proper focus of the (EPA) proceeding—the technological feasibility and lead time for those manufacturers to comply with the subject greenhouse gas standards.'' Document ID No. EPA–HQ–OAR–2006–0173.3601 at 26. That statement remains true today, and stands in stark contrast to the renewed demonstration CARB has made in this reconsideration proceeding.[208]

Regarding the lead time provided by California to meet the near-term and the mid-term and later standards, the commenters have not met their burden to show that the lead time is insufficient. California provided manufacturers 4–5 years before the near-term GHG standards would go into effect and 8–9 years before the later standards, giving substantial time for development of technologies to meet the standards. The industry commenters have not shown that this lead time was insufficient, both for the near-term GHG standards, that were based on technologies already known and developed, as well as for the mid-term GHG standards, where CARB provided a reasonable pathway to be followed—answering theoretical objections, identifying major steps needed to refine technology, and offering plausible reasons for predicting successful technologies.[209]

Regarding the cost component of the technological feasibility test, EPA believes that the opponents of the waiver have not met the burden of proof to show that the GHG standards are not technologically feasible because of excessive cost. The industry cost study (from Sierra Research) from the CARB rulemaking found an average vehicle cost increase of about $3,000 to comply with the CARB standards, an increase which CARB rebutted in detail, and which was also found not credible by the district court in the Vermont litigation. Alternatively, even if the industry estimates were closer to the mark than the CARB estimates, CARB points out that Congress was concerned with standards causing a *doubling or tripling* of vehicle costs (MEMA 627 F.2d at 1118), not the cost increases that CARB has projected (ranging from under $100 for some manufacturers in near-term to a maximum of $1,100 to $1,350 for vehicles in the 2016 MY).[210]

Therefore, for the above reasons, I am unable to find that the CARB GHG motor vehicle emission standards are not technologically feasible within the available lead-time giving consideration to the cost of compliance.

F. Other Issues Related to Consistency With Section 202(a)

1. Impact of EPA's March 6, 2008 Denial on Lead Time

In EPA's February 12, 2009 **Federal Register** notice, EPA specifically sought comment on the effect of the March 6, 2008 Denial on whether CARB's GHG standards are consistent with section 202(a), including lead time.

In comments submitted for this reconsideration, the industry commenters asserted that any lead time clock that may have been running should have stopped completely and immediately upon EPA's March 6, 2008 Denial. Both the Alliance of Automobile Manufacturers and the Association of International Automobile Manufacturers noted that even CARB officials testified that manufacturers should have started development of their 2010–2012 MY product lines at the time the final standards were finalized in the 2004–2005 time frame, and that there should be a presumption that the industry could and would stop ongoing development efforts when this waiver was denied.[211] In its comments, the Alliance noted that it should not be assumed that a ''retroactive'' waiver would impose no hardship because manufacturers are able to earn credits for sales for the 2009 and 2010 MYs in advance of any waiver grant. They claim that the regulated parties would have conducted their business differently if they knew in advance that these regulations would be enforced.[212]

On the other hand, CARB urges EPA to reject the argument that the March 6, 2008 Denial tolled the lead time countdown. CARB noted that it always maintained that it intended to enforce the GHG standards from their start point for the 2009 MY, discussed how it pursued promptly all available avenues to overturn the March 6, 2008 Denial, and noted that the denial was all but guaranteed to be revisited because its waiver request was supported by both candidates for President in 2008. Additionally, CARB argues that any period the March 6, 2008 Denial was in effect was not significant compared to the four to ten years of lead time available to the manufacturers, and that technological advancements continued to appear during the denial period.

The manufacturers argue that EPA's earlier denial was reasonably relied upon by manufacturers, that the denial tolled or suspended lead time and allowed them to stop working towards compliance, which affects the adequacy of the lead-time for California's standards. This amounts to an argument that they reasonably had the opportunity to stop work towards

[207] California Air Resources Board, EPA–HQ–OAR–2006–0173–9006 at 27.

[208] California Air Resources Board, EPA–HQ–OAR–2006–0173–9006 at 29. CARB also noted, that in the final efforts to persuade EPA to deny this waiver, waiver opponents cited policy arguments against the waiver, such as the preference for a uniform national standard to avoid a ''patchwork'' of state regulations, rather than any attack on the technological feasibility of the standards.

[209] Regarding lead time, some industry comments suggest that EPA should count lead time from the time the waiver is granted. EPA, however, believes that lead time should run from the time the rule is adopted by California. As EPA made clear in its waiver decision for California's standards regulating medium-duty motor vehicles (59 FR 48625 (Sept. 22, 1994), Decision Document at 39–41), lead time should generally be measured from the point at which California adopts its regulations. At that point, the regulations, and their obligations on regulated parties, are clear. EPA measures lead time for its regulations from the time of promulgation, which is analogous to California's adoption of its regulations. EPA review of CARB waiver requests causes no more uncertainty than judicial review of EPA regulations. In addition, California and regulated parties do not know when EPA will make a final decision on a request for waiver of preemption, so California would have little ability to evaluate lead time at the time it adopts its standards if lead time were based on a future action by another entity the timing of which is uncertain. In any case, the commenters have not shown that the amount of lead time provided from the date of the waiver is insufficient.

[210] California Air Resources Board, EPA–HQ–OAR–2006–0173–0010.14 at 80–83 and, EPA–HQ–OAR–2006–0173–0004.1 at 39–40.

[211] Alliance of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–8994.2 at 27, and, Alliance of International Automobile Manufacturers, EPA–HQ–OAR–2006–0173–9005.2 at 16, Note 4.

[212] Alliance of Automobile Manufacturers, EPA–HQ–OAR–2006–0173–8994.2 at 23–25, *see also* National Automobile Dealers Association, EPA–HQ–OAR–2006–0173–8956.1, at 10–12.

compliance at that point if they chose. However it does not change the basic issue before EPA: whether the manufacturers, as opponents of the waiver, demonstrated that the standards are not consistent with section 202(a) because of inadequate lead time.

Based on a review of the entire record, and even assuming the reasonableness of the manufacturers' claim that they could have reasonably stopped work towards compliance upon the March 6, 2008 Denial, the industry commenters have not shown that the lead time provided under these circumstances was insufficient. This is particularly true regarding the near-term GHG standards, which were based on technologies already known and developed. But this is also true for the mid-term GHG standards, where CARB provided a reasonable pathway to be followed—answering theoretical objections, identifying major steps needed to refine technology, and offering plausible reasons for predicting successful technologies.[213] I believe that this is borne out by the evidence submitted to the record by CARB and the NRDC, which show industry-wide compliance with the near-term GHG standards and with future-term compliance attainable using technology developments as well as early credits. Manufacturers have not come forward with evidence to show that they cannot feasibly achieve the near-term or mid-term GHG standards, based on lead time. Although the industry trade association comments generally discussed manufacturers' reliance on the EPA waiver denial to suspend or stop planning for California compliance, no manufacturer came forward and asserted that it actually stopped planning. Whatever disruptions may or may not have occurred as a result of the denial, near-term standards have clearly been shown to be feasible and mid-term standards are clearly feasible given the lead time provided, even taking account of the denial.

Regarding implementation and enforcement by CARB for the 2009 MY, manufacturers claim that approving the waiver for that year would be a retroactive grant of a waiver and would be improper. However, approval of the waiver for the 2009 MY technically would not be a retroactive action. EPA would not be determining that past conduct was or was not lawful when it occurred in the past, or rewriting past legal obligations. The legal obligation at issue is still a future obligation—compliance with the annual fleet-averaging requirements for the 2009 MY standards by the end of 2009, based on sales throughout the year. The fact that some conduct which occurred in 2009 prior to the grant of the waiver is relevant to determining compliance with the 2009 MY obligation, after the end of the model year, does not by itself make the obligation to comply with the 2009 MY standards a retroactive legal obligation. In any case, even if a waiver for the 2009 MY was considered to impose retroactive obligations, EPA has the authority in an adjudication to take such action under appropriate circumstances.[214]

Under these circumstances, all of the evidence presented to date indicates that manufacturers will be in compliance with the 2009 standards. EPA is granting the waiver for 2009 and later years. However, out of an abundance of caution, and since any delay in granting this waiver stems from EPA's prior March 2008 Denial, EPA is imposing one specific limitation designed to ensure that CARB not hold a manufacturer liable or responsible for any noncompliance civil penalty action that could be caused by emission debits generated by a manufacturer for the 2009 model year. For the 2009 model year, CARB can fully implement and enforce its regulations, including implementation of CARB's Executive Orders for 2009 model year families issued both before and after the date of today's waiver, as described below. While debits from model year 2009 may offset credits generated in later years, and reduce the amount of credits available to a manufacturer, any debits from model year 2009 may not be used as a basis for holding a manufacturer in noncompliance and no civil penalties may be assessed based on such debits. Other than that restriction, CARB may fully implement and enforce, and manufacturers may use the GHG standards program as promulgated, such that CARB may implement certification for MY 2009 motor vehicles, and may grant manufacturers credits that can be used for future obligations. This restriction on handling of any possible debits appropriately limits any potential concern raised by manufacturers over their potential reliance upon EPA's previous waiver denial.

2. Endangerment of Public Health or Welfare

a. Is it Appropriate To Review Endangerment of Public Health or Welfare Under the ''Consistency With Section 202(a)'' Criterion?

EPA has traditionally stated that a state standard would be inconsistent with section 202(a) if there is inadequate lead time to permit the development of the necessary technology, given the cost of compliance within that time, or if the Federal and State test procedures impose inconsistent certification requirements.[215] The legislative history of this provision and judicial precedent indicate that technological feasibility in the lead time provided was intended to be the primary focus of this criterion.[216]

However, several industry commenters have suggested that in the context of this waiver, it is also appropriate for EPA to include endangerment to public health or welfare in its evaluation of consistency with section 202(a). They note the language in section 202(a)(1) of the Clean Air Act that requires the Administrator to promulgate standards ''applicable to the emission of any air pollutant * * * which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.''

While acknowledging the limits of EPA's traditional review under the ''consistency with section 202(a)'' criterion, they note that previous waivers have generally reviewed standards designed to reduce concentrations of air pollutants, like criteria air pollutants that EPA has listed under section 108 of the CAA, for which an endangerment finding required under section 202(a)(1) has already been made. Even standards regulating PM and formaldehyde, for which EPA has granted waivers, involved pollutants that had been identified by EPA, or by Congress in the Clean Air Act, as needing regulation. Thus, the question of endangerment was not in dispute in previous waivers. By contrast, EPA has not made any final decision regarding whether emissions of GHGs from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare (this two-part

[213] EPA notes here (again) that lead time begins when California promulgates its standards, not when the waiver is granted.

[214] *Securities and Exchange Commission* v. *Chenery Corp.,* 332 U.S. 194 at 203 (''That such action might have a retroactive effect was not necessarily fatal to its validity. Every case of first impression has a retroactive effect, whether the new principle is announced by a court or by an administrative agency. But such retroactivity must be balanced against the mischief of producing a result which is contrary to a statutory design or to legal and equitable principles. If that mischief is greater than the ill effect of the retroactive application of a new standard, it is not the type of retroactivity which is condemned by law.'').

[215] 68 FR 19811, 12 (April 22, 2003).

[216] *MEMA III,* 142 F. 3d at 463; *Ford,* 606 F. 2d at 1296, n. 17, 1297; H.R.Rep, No. 728, 90th Cong, at 22–23.

test is hereafter referred to as ''endangerment''). This is a requirement for EPA to issue regulations under section 202(a).[217] Thus, the commenters state that there is an issue for review in this waiver under the consistency with section 202(a) criterion that was never relevant for EPA's review of previous waiver requests.

In contrast, CARB states that no new test of consistency with section 202(a) is warranted or permissible. CARB argues that precedent shows that nothing more than technological feasibility and test compatibility is required under section 209(b)(1)(C).

I find that in this instance, I do not need to resolve the issue of whether it is appropriate to address the issue of endangerment under the consistency with section 202(a) criterion of section 209(b). This is because in this instance, I find that even if the issue of endangerment is relevant to EPA's evaluation of consistency with section 202(a), those opposing the waiver have not met their burden of proving that California's regulations are inconsistent with section 202(a) based on that concern.

b. Parties Opposing the Waiver Have Not Met Their Burden of Showing Lack of Endangerment to Public Health or Welfare

As noted above, parties opposed to a waiver have the burden of proof to show that one of the findings under section 209(b)(1) should be made. To the extent that the two-part endangerment test is relevant to a determination of consistency with section 202(a), those opposing a waiver must affirmatively demonstrate that California's standards are inconsistent with this criterion. They have failed to do so in this instance.

Commenters who claim that EPA should deny the waiver generally base their claim on the fact that EPA has not yet determined whether greenhouse gas emissions from new motor vehicles cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare, or promulgated greenhouse gas standards pursuant to section 202(a). They claim that unless and until EPA makes such a determination that authorizes regulation under section 202(a), EPA cannot grant a waiver to California. They also state that the fact that the current California waiver request pertains to global climate change emissions, rather than to conventional pollutants, means that EPA should not give California's waiver request a presumption of consistency under Section 209(b)(1)(C).

In contrast, commenters supporting the waiver request contend that EPA's lack of a determination on endangerment and lack of GHG emission regulations is not relevant to EPA's consideration of the waiver request. CARB notes in its comments that EPA may not find inconsistency on the ground that EPA must first make its own endangerment finding on GHG emissions before granting California's waiver request. CARB suggests that *Massachusetts* v. *EPA*'s contemplation of coordinated activity at the federal level is entirely irrelevant to the waiver. CARB also provides significant discussion on this issue providing evidence that, according to CARB, shows that global climate change does endanger public health and welfare.

Manufacturer suggestions that EPA should deny California's request because it has not yet made a finding of endangerment mistake the burden of proof that opponents of a waiver are obliged to meet before EPA must deny a waiver. To deny a waiver based on section 209(b)(1)(C), EPA must find that California's standards ''are not consistent with section 202(a).'' It is not enough that EPA has not made a decision on the subject of whether GHG standards are authorized under section 202(a). To deny a waiver the Administrator must affirmatively find that the standards are inconsistent with section 202(a). The initial presumption of consistency is not dependent on the pollutants being regulated, as suggested by commenters—the presumption is provided for in the statute.[218] Regarding endangerment, therefore, I believe that, to the extent it is even an appropriate criterion under section 209(b)(1)(C), it would not be appropriate to deny a waiver request unless it is affirmatively demonstrated that the pollutants being regulated do not ''cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.''

To the extent endangerment is relevant to whether California's standards are consistent with section 202(a), this criterion should be narrowly interpreted and should require more than the fact that EPA has not yet made a final decision concerning endangerment. Denial of a waiver based on this issue should require either a previous determination by EPA on the merits that the endangerment test has not been met, or a demonstration in this proceeding by the opponents of the waiver that EPA could not find that the endangerment test is met. Lack of a final decision by EPA on this would not be sufficient to deny the waiver. Those opposing the waiver cannot simply point to an open question regarding the issue at hand—on the contrary, they must come forward with evidence demonstrating that California's standards are not consistent with section 202(a).[219]

In order to regulate emissions of a particular pollutant under section 202(a), EPA must review several issues, including whether the emissions of the pollutant from motor vehicles cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare, and whether the standards are technologically feasible within the lead time provided. EPA has to make such determinations as part of lawfully adopting GHG standards under section 202(a). However, lack of either kind of action by EPA is not by itself evidence that GHG standards are in fact inconsistent with section 202(a). The fact that EPA has not yet made either determination, in the context of its own rulemaking, is by itself not a basis to deny a waiver.

Congress understood that California may act a ''laboratory for innovation'' in the regulation of motor vehicles, and intended section 209 to allow such innovation.[220] Yet the ability of California to encourage such innovation would be greatly compromised if EPA were to determine that California could take no action under section 209 unless EPA had already made all of the necessary determinations regarding the consistency of its own standards in the context of its own regulation under section 202(a).

In similar instances where EPA reviewed California standards and EPA had not promulgated similar standards, EPA has determined that the absence of EPA standards does not by itself preclude a waiver or prevent its ability to review California's standards under section 209. Any comparisons necessary

[217] On April 24, 2009, EPA published a notice proposing to find that elevated concentrations of greenhouse gases in the atmosphere are reasonably anticipated endanger the public health and welfare of current and future generations and also proposing to find that emissions of carbon dioxide, methane, nitrous oxide, and hydrofluorocarbons from new motor vehicles and new motor vehicle engines are contributing to this air pollution under section 202(a) of the Clean Air Act. 74 FR 18885, 18886.

[218] See *MEMA I,* 627 F. 2d at 1121 (''The language of the statute and its legislative history indicate that California's regulations, and California's determination to comply with the statute, when presented to the Administrator are presumed to satisfy the waiver requirements and that the burden of proving otherwise is on whoever attacks them.'').

[219] See *MEMA I,* 627 F. 2d at 1126.

[220] *See MEMA I,* 627 F. 2d at 1111.

under section 209 would simply take account of the absence of EPA regulations, *i.e.,* the comparison would be California standards to the absence of EPA standards. For example, under the similar procedures of section 209(e), EPA authorized California to enforce its standards on evaporative emissions for small nonroad engines despite the fact that EPA had not yet promulgated evaporative standards for such engines.[221] In any case, commenters' discussions of ''comparisons to federal standards'' in this context is more suited to review of section 209(b)(1)(A), which discusses comparisons between California and applicable federal standards. Section 209(b)(1)(C) concerns whether California standards are consistent with section 202(a). This criterion is not dependent on the existence of comparable federal standards.[222]

An additional reason for interpreting the waiver criterion this way, and not determining inconsistency with section 202(a) based on lack of an EPA final decision on an issue, is that EPA may always take action in the future that may impact the criteria for a waiver. For example, if in the future EPA promulgated standards that were more stringent than California's standards, this could implicate the ''protectiveness'' criterion of section 209(b)(1)(A). The possibility of such future events should not be used as a reason to deny a waiver now. Instead, the impact of a future EPA action should be considered if and when EPA takes action. Otherwise, the waiver could be denied now, even though in the future it could be determined that it should have been granted. This would tend to reverse the statutory presumption of the grant of waiver unless opponents demonstrate it should be denied for certain specific reasons. Instead, it would be denied because of some future possible action that may or may not occur, and may be delayed for an unspecified period of time. Basing a denial on the possibility of events that may happen in the future is not consistent with Congress' goal to preserve the broadest possible discretion to California. A more prudent approach is to take action based on the record at hand, with the possibility of reviewing such action in the future if facts change that merit such a review. As discussed above in section IV.C.1, EPA may withdraw a waiver in the future if circumstances make such action appropriate.

It is important to remember that the criterion being reviewed under section 209(b)(1)(C) is consistency with section 202(a) and not consistency with EPA standards. EPA has considerable deference within section 202(a) to promulgate the regulations it believes are most reasonable. The test for EPA under section 209(b)(1)(C) is not whether California standards are the same as the standards that EPA has promulgated or would promulgate under section 202(a), but whether the opponents of the waiver have met their burden to show, based on the record before the Agency, that the standards promulgated by California could not lawfully be promulgated in a manner consistent with section 202(a). As a prior Administrator has stated:

> I would feel constrained to approve a California approach to the problem which I might also feel unable to adopt at the federal level in my own capacity as a regulator. The whole approach of the Clean Air Act is to force the development of new types of emission control technology where that is needed by compelling the industry to ''catch up'' to some degree with newly promulgated standards. Such an approach * * * may be attended with costs, in the shape of a reduced product offering, or price or fuel economy penalties, and by risks that a wider number of vehicle classes may not be able to complete their development work in time. Since a balancing of these risks and costs against the potential benefits from reduced emissions is a central policy decision for any regulatory agency under the statutory scheme outlined above, I believe I am required to give very substantial deference to California's judgments on this score.[223]

In this case, opponents of the waiver have not met their burden of proving that EPA could not find that emissions of GHGs from new motor vehicles cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare. To the contrary, while California and others have provided a great deal of evidence regarding the dangers posed by GHGs, opponents of the waiver have not provided significant evidence that emissions of GHGs from motor vehicles do not cause or contribute to air pollution that can reasonably be anticipated to endanger public health or welfare. The recent EPA proposal to find that elevated concentrations of greenhouse gases in the atmosphere are reasonably anticipated to endanger public health and welfare, and to find that emissions of carbon dioxide, methane, nitrous oxide, and hydrofluorocarbons from new motor vehicles and new motor vehicle engines are contributing to this air pollution under section 202(a) of the Clean Air Act is further indication that opponents of the waiver did not meet their burden of proof on this issue.[224] Thus, I cannot find that those opposing the waiver have met their burden of proving that California's GHG standards are not consistent with section 202(a) for reasons of the endangerment test.[225]

G. Section 209(b)(1)(C) Conclusion

Based on its review of the information in the docket of this proceeding, I have determined that the opponents have not met their burden to demonstrate that the CARB GHG standards are not consistent with section 202(a). Therefore, I am unable to find that the CARB motor vehicle GHG emission standards are not consistent with section 202(a) of the Act.

VII. Additional Issues Raised

A. EPA's Administrative Process for Evaluating California's Waiver Request

1. Public Comment Process

Section 209(b)(1) states in part that ''The Administrator shall, after notice and opportunity for public hearing, waive application of this section * * *'' In response to this language, EPA has consistently announced in the **Federal Register** the opportunity for a public

[221] 71 FR 75536 (December 15, 2006).

[222] Commenter Alliance appears to put much weight on the existence of section 202(b)(3). That subsection was added in 1977 to ensure that where EPA provides a waiver for vehicle standards, vehicles meeting California standards can still receive a Federal certificate and be sold in California and other states where California standards are applicable. This was needed as some of the California standards may not individually be as stringent as federal standards, given the ''in the aggregate'' protectiveness provision. See discussion in *Ford* v. *EPA,* 606 F.2d 1293 (DC Cir. 1979). Without this provision, where more stringent individual federal standards applied, vehicles complying only with California standards could not receive a federal certificate of conformity. The language therefore is designed to deal with situations where federal standards exist, and may be more stringent than California's. It was not intended to add or imply any new substantive requirements regarding the existence of federal standards. Similarly, Alliance's reference to use of the word ''the'' in section 202(b)(2) is directed towards the first criterion of section 209(b), not the third. In any case, the argument raised could at most mean that section 209(b)(2) is not applicable to this waiver request. California does not rely on section 209(b)(2) in its request. Also, as noted above, EPA has long held that the absence of comparable federal standards would not automatically result in a denial of a waiver request under the ''in the aggregate'' criterion because EPA believes the appropriate comparison is between the protectiveness of the California standards as compared to the absence of the federal standards.

[223] 40 FR 23104.

[224] 74 FR 18885 (April 24, 2009).

[225] Some commenters have indicated that if EPA chooses not to deny the waiver based on lack of an endangerment finding, EPA should hold its decision in abeyance until it makes a finding. However, given the burden of proof on opponents of a waiver, and the lack of any significant evidence to the contrary in the record on this issue, I believe it is not appropriate to delay further a decision on this matter.

hearing for any waiver request received from CARB. As a general matter EPA has also offered an opportunity for written comment which has opened on the date of the **Federal Register** notice and closed on a date after the public hearing. As part of EPA's public hearings, the presiding officer has consistently stated that the hearing was being conducted in accordance with section 209(b) of the Clean Air Act and that any interested parties have the opportunity to present both oral testimony and written comments.

EPA has received comment suggesting that EPA has failed to provide any systematic procedure for commenters opposing the waiver to rebut the comments of those commenters supporting the waiver. Because opponents bear the burden of proof, this commenter believes that EPA should not treat the waiver proceeding like an informal rulemaking but instead clearly announce what evidence is admissible and applicable burdens of proof and evidentiary procedures, such as order of proof and argument that parties must follow.[226]

EPA's waiver proceedings and actions under section 209(b)(1) are informal adjudications. In a waiver proceeding, EPA receives a request from one entity (CARB) that is presenting an existing regulation established as a matter of California law. The request is for a waiver of preemption for that party, so it may adopt and enforce the specific regulations. In deciding this request, EPA interprets and applies the three specific criteria established by the Act, and under this provision EPA is required to grant the waiver unless EPA makes one of the three specified findings. EPA applies the pre-existing law, section 209(b), to a specific request covering a specific regulation or regulations, and applies the three statutory criteria to the facts of the specific request. The decision to grant or deny a waiver changes the legal rights of the party before EPA, California. If EPA grants the waiver, then CARB may enforce its state regulations. In that case, the rights and obligations of other parties, for example, the manufacturers, are affected by the operation of the state regulation that is no longer preempted. In addition, under a separate statutory provision, other States may then adopt and enforce California's' standards, under their state law. While these subsequent impacts clearly affect the legal rights and obligations of various parties, the only legal rights and obligations directly determined by EPA in the waiver proceeding are the rights of the State of California to adopt and enforce its state regulations. The other legal impacts flow from the operation of other laws, once the waiver is granted. Therefore EPA believes that its waiver proceedings and actions therein should be considered an informal adjudication rather than a rulemaking. EPA has been conducting its waiver proceedings in this manner for decades, and while Congress has amended provisions in section 209 on two separate occasions, Congress has not chosen to alter EPA's administrative requirements. Instead, Congress has expressed support for EPA's practice in applying and interpreting section 209(b).[227]

EPA disagrees with the suggestion that its waiver proceedings are governed by section 554 of the Administrative Procedure Act (APA) or any other provision of Title 5 of the United States Code, including sections 556, 557 and 558. Section 554 of the APA, regarding formal adjudications, only applies to adjudications required by statute to be determined on the record after an opportunity for an agency hearing. Section 209(b)(1) merely states that the Administrator shall provide notice and opportunity for a public hearing and does not include language stating that EPA's decision shall be on record after an opportunity for a hearing. Conversely, other provisions in the Clean Air Act, including section 205(c)(1) specifically state that EPA's actions shall be made on the record after opportunity for a hearing in accordance with sections 554 and 556 of title 5 of the United States Code. Section 205(c)(1) also requires the Administrator to issue reasonable rules for discovery and other procedures for hearings.

Any potential action on the waiver request is not subject to the requirements of APA section 558(c). Any potential action by EPA would not constitute granting a ''license'' to California. The fundamental purpose of section 209(b) is to waive application of the preemption set forth in section 209(a) of the Act, and is not a formal approval of the type contemplated in the APA. As noted previously, CARB must merely submit its regulations to EPA with a finding that its standards, in the aggregate, are as protective of public health and welfare as applicable federal standards. Unlike a license or permit applicant, the burden of proof is on the opponents of the waiver and EPA must make an affirmative finding of one of the three waiver criteria in order to deny California's waiver request. On the face of the Act, what California receives from EPA is a waiver, not a license or permit.

Contrary to commenter's claim, APA section 558 does not require the ''adversary process'' described in sections 556 and 557 for this action. APA section 558 requires the agency to ''complete proceedings required to be conducted in accordance with sections 556 and 557 of [the APA] *or* other proceedings required by law.'' 5 U.S.C. 558(c) (emphasis added). By complying with the procedural requirements of section 209(b) of the Act, EPA is complying with both the CAA and any relevant standards set in the APA.

Regardless, the approval provision in APA section 558 was not meant to establish additional procedural requirements beyond those required by law. Instead, the goal of the approval provision of the section is to ensure ''that an agency shall hear and decide licensing proceedings as quickly as possible.'' Attorney General's Manual of the APA (1947), 89. *Horn Farms* is not applicable to this situation, as the dicta statement regarding APA section 558 applied only to section 558's provisions regarding revoking a previously granted license, which is not at issue here.

EPA believes that only those actions or sections of the Clean Air Act that specifically reference section 554 or otherwise state that EPA's decision must be determined on the record after an opportunity for a hearing are subject to the formal adjudication requirements of the Administrative Procedure Act. EPA nevertheless, as part of good administrative practice, provides every interested party the opportunity to present oral testimony and provide written comment based on a **Federal Register** notice that clearly sets out the criteria by which EPA will evaluate CARB's waiver requests. EPA believes all commenters, including opponents of the waiver, have had ample opportunity to comment and meet their applicable burdens of proof. Opponents of CARB's GHG regulations and of its waiver request have had ample opportunity to present their viewpoints during the course of CARB's rulemaking and EPA's waiver proceeding. First, as noted in the March 6, 2008 Denial, in response to several requests to extend the comment period during EPA's initial consideration of CARB's waiver request EPA indicated that consistent with past waiver practice, it would continue, as appropriate, to communicate with any

[226] Alliance of Automobile Manufacturers, EPA–HQ–OAR–2006–0173.8994 at C–2 through C–4.

[227] The Committee on Interstate and Foreign Commerce that drafted the amendments to section 209 in 1977 stated that the amendment was ''intended to ratify and strengthen the California waiver provision and to affirm the underlying intent of that provision, *i.e.,* to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare.'' (H.R. Rep. No. 294 301–302 (1977)).

stakeholders in the waiver process after the comment period ended and that it would continue to evaluate any comments submitted after the close of the comment period to the extent practicable.[228] EPA did not receive any request to extend the written comment period during the reconsideration of CARB's request. Opponents have also had the opportunity to submit lengthy comments during two separate comment periods (one of which occurred well after CARB had submitted all of their initial comments) and to testify at three separate public hearings. The regulated industry has in its possession, along with CARB, the necessary information to adequately comment on whether the GHG emission standards are technologically feasible and also what CARB has said about the protectiveness of its standards from both CARB's rulemaking phase and from earlier comments. Opponents have the same access to the necessary information in order to formulate comments in regard to the second waiver criterion at section 209(b)(1)(B).

2. EPA's Reconsideration Process

Upon receiving CARB's January 21, 2009 request for reconsideration of the March 6, 2008 waiver Denial, EPA published a notice on February 12, 2008 notifying the public that EPA was reconsidering its March 6, 2008 Denial, and was providing an additional hearing and the opportunity to submit comment on all issues relevant to the waiver, including inviting comment on certain specific criteria and questions.

EPA received comment suggesting that the February 12, 2009 notice failed to inform the public of relevant issues and contained misleading statements and, therefore, the Agency must issue a new notice before proceeding with any reconsideration of the denial.[229] This commenter notes the EPA fails to discuss the legal standards EPA believes it must meet to justify reconsideration of a major policy action including the legal standards EPA believes governs how it is to reopen a previously decided matter. EPA believes this commenter fundamentally misunderstands the purpose of the February 12, 2009 notice. EPA's February 12, 2009 notice did not constitute a final decision to change the Agency's position with regard to California's greenhouse gas waiver request, and did not implicate any arguable requirement to supply a justification for changing previous interpretations of law or evidentiary findings. The Agency set forth sufficient reason for initiating a reconsideration process, and is under no obligation to provide anything further in the Notice announcing the process. EPA clearly set forth the criteria and issues it would review in the notice for reconsideration, which covered all of the issues relevant under section 209(b). It was unnecessary to provide any further justification for its reconsideration beyond that which was supplied in the notice. Commenters have failed to disclose that any procedural error by EPA prejudiced them in any way, or that EPA's February 12, 2009 notice limited their ability to fully comment on any of the issues relevant to California's request for a waiver.

3. Is a Waiver Required Before California or Section 177 States Adopt California's Motor Vehicle Emission Standards?

Several commenters have suggested that section 209(a), which provides that no ''political subdivision shall adopt or enforce any standard,'' should be read to mean that neither California nor any Section 177 state may ''adopt'' a motor vehicle emission emissions regulation before EPA grants a waiver. Since lead time is an issue under section 209(b)(1)(C), see section VI, EPA believes it appropriate to clarify this issue especially since EPA has previously stated that lead time runs from the date of adoption of the regulation. Similarly, because of the number of states that have already adopted CARB's GHG emission standards EPA believes it appropriate to clarify this issue for purposes of section 177 as well.

EPA believes that section 209(b) on its face provides the necessary clarification as to whether California should adopt its regulations before or after receiving a waiver from EPA. Section 209(b)(1) clearly envisions EPA commencing a waiver process after California has submitted standards that have been adopted. Section 209(b)(1) states in part ''The Administrator shall, after notice and opportunity for public hearing waive application of this section to any State which *has adopted* standards * * *'' (Emphasis added). It would be illogical, if not impossible, for EPA to analyze the criteria in section 209(b) if it does not have a final regulation upon which to do the analysis. It would not be appropriate for EPA to analyze non-final documents that may or may not become final and that may or may not be revised prior to becoming final. Similarly, the courts have long interpreted the Clean Air Act to authorize pre-waiver adoption of California standards by an opt-in state.[230]

B. Scope of EPA's Waiver Review

1. Relevance of the Energy Policy and Conservation Act (EPCA) to the Waiver Decision

In EPA's initial **Federal Register** notice of California's request for a waiver, we requested comment on whether the Energy Policy and Conservation Act (EPCA) fuel economy provisions are relevant to EPA's consideration of the request and to California's authority to implement its vehicle GHG regulations.[231]

EPA received many comments regarding EPCA and its effect, or lack thereof, on this proceeding. Several commenters stated that the provisions of EPCA are not relevant to EPA's waiver determination. They note that the language of section 209(b) limits the authority of EPA to deny a waiver to three criteria and does not reference inconsistency with EPCA (or with any other statute, other than section 202(a) of the Clean Air Act) as a basis for denial. One commenter noted that EPCA was already in existence when Congress strengthened California's authority to adopt motor vehicle emission standards, and Congress indicated no intent to limit such authority based on EPCA. Some commenters noted the Supreme Court decision in *Massachusetts* v. *EPA,* which stated that EPCA does not license EPA to shirk its environmental responsibilities under the Clean Air Act.

Several commenters also provided arguments regarding their view that California's GHG standards were consistent with the provisions of EPCA.

Other commenters stated that California's standards violate EPCA. Several of these commenters noted that EPA and court precedent regarding section 209(b) indicate that EPA cannot rule on EPCA preemption under section 209(b). However, the commenters state that if EPA does consider EPCA-related issues in this waiver proceeding, it must rule that California's standards violate EPCA. One commenter states that recent court cases have created confusion regarding the scope and effect of EPA waivers. The commenters state that if EPA decides not to address the issue of EPCA preemption in this proceeding, it

---

[228] 73 FR 12156, 12157 (March 6, 2008).

[229] Utility Air Regulatory Group, EPA–HQ–OAR–2006–0173–8690 at 2–5.

[230] *See Motor Vehicle Manufacturers Association* v. *New York Dept. of Environmental Conservation,* 17 F.3d 521, 533–34 (2d Cir. 1994)—''[T]he plain language of 177, coupled with common sense,'' leads to the conclusion that other states 'may adopt the [California] standards prior to the EPA's having granted a waiver, so long as [the state] makes no attempt to enforce the plan prior to the time when the waiver is actually granted.''

[231] 72 FR 12261.

needs to explicitly state that it is not addressing the issue of express preemption under EPCA or conflict with EPCA, and that those issues are best left to the courts.

As EPA has stated on numerous occasions, section 209(b) of the Clean Air Act limits our authority to deny California's requests for waivers to the three criteria therein, and EPA has refrained from denying California's requests for waivers based on any other criteria. As EPA noted in its initial decision denying California's waiver request, the decision was ''based solely on the criteria in section 209(b) of the Clean Air Act and this decision does not attempt to interpret or apply EPCA or any other statutory provision.'' [232] Where the Court of Appeals for the District of Columbia Circuit has reviewed EPA decisions declining to deny waiver requests based on criteria not found in section 209(b), the court has upheld and agreed with EPA's determination.[233]

As many of the commenters note, evaluation of whether California's GHG standards are preempted, either explicitly or implicitly, under EPCA, is not among the criteria listed under section 209(b). EPA may only deny waiver requests based on the criteria in section 209(b), and inconsistency with EPCA is not one of those criteria. In considering California's request for a waiver, I therefore have not considered whether California's standards are preempted under EPCA. As in the March 2008 decision, the decision on whether to grant the waiver is based solely on the criteria in section 209(b) of the Clean Air Act and this decision does not attempt to interpret or apply EPCA or any other statutory provision. EPA takes no position regarding whether or not California's GHG standards are preempted under EPCA.

2. Do California's GHG Emission Standards Create an Impermissible ''Patchwork''?

Under section 177 of the Act, other states may adopt California new motor vehicle emission standards under certain conditions. In this waiver proceeding EPA received comment suggesting that sections 202(a), 209(a) and 177 of the Act establish a regulatory framework designed to foster a national marketplace for vehicles while recognizing California's ability to establish its own program which can be adopted by other states. EPCA however, sets a single national fuel economy standard and is designed to prevent a fracturing of the marketplace into individual state programs. Commenters argue that manufacturers will have at least 15 different fleets they will have to balance for purposes of fuel economy and greenhouse gas emissions flowing from the fleet-average emission requirements of each state. Manufacturers also are concerned that there are significant differences between manufacturers' fleets in California and those in individual section 177 states creating unnecessary compliance burdens. The commenters suggest that the federal government should establish a single, national program for regulation of vehicle greenhouse gas standards and fuel economy.

EPA also received comment stating that to the extent the auto industry is arguing that a patchwork is created because of differences between fleet composition in different states, that argument lacks merit and is irrelevant to this waiver proceeding. Citing an EPA waiver decision from 1971, this commenter notes that claims such as the patchwork issue are not appropriate in a waiver proceeding since EPA's consideration of evidence submitted during a waiver proceeding is limited by its relevance to the three waiver criteria EPA must consider under section 209. This has led EPA to previously reject arguments that are not specified in the statute as grounds for denying a waiver.[234]

Similar to EPA's response to the EPCA claims noted above, EPA may only deny waiver requests based on the criteria in section 209(b). The actions of other states relating to the adoption of the California GHG emission standards is not a factor I may consider under section 209(b). The actions of such states are authorized under a separate section of the Act, section 177, and must conform to the requirements of that section, including identicality. Section 209(b) does not authorize me in reviewing a waiver request to consider the impact of actions or potential actions taken by other states under section 177 of the Act.[235] I therefore will not consider this claim in determining whether to grant California's waiver request.

It is important to note that on May 19, 2009, EPA and the Department of Transportation (DOT) issued a ''Notice of Upcoming Joint Rulemaking to Establish Vehicle GHG Emissions and CAFE Standards'' announcing EPA and DOT's intent to work in coordination to propose standards for control of emissions of greenhouse gases and for fuel economy, respectively. If proposed and finalized, these standards would apply to passenger cars, light-duty trucks, and medium-duty passenger vehicles (light-duty vehicles) built in model years 2012 through 2016. EPA believes that if these standards are ultimately adopted, they would represent a harmonized and consistent national policy pursuant to the separate statutory frameworks under which EPA and DOT operate.

3. What Impact Does Granting California a Waiver for Its GHG Emission Standards Have on PSD Requirements for GHGs?

Several commenters suggest that there would be a major consequence if an EPA waiver were to trigger other requirements under the Act, including Prevention of Significant Deterioration (PSD) requirements, and should it grant the waiver, EPA should state clearly that the waiver does not render GHGs ''subject to regulation'' under the Act. EPA also received comment suggesting that the question of when and how GHGs should be addressed in the PSD program or otherwise regulated under the Act should instead be addressed in separate proceedings dedicated to evaluating the complicated issues and impacts associated with those issues.

EPA agrees that these issues are not relevant to the waiver decision criteria, and are most appropriately addressed in a separate forum. EPA is not addressing these issues in today's decision.

VIII. Decision

After review of the information submitted by CARB and other parties to this Docket, I find that those opposing the waiver request have not met the burden of demonstrating that California's regulations do not satisfy any of the three statutory criteria of section 209(b). For this reason, I am granting California's waiver request to enforce its motor vehicle GHG emission regulations.

My decision will affect not only persons in California but also persons outside the State who would need to comply with California's GHG emission regulations. For this reason, I hereby determine and find that this is a final action of national applicability.

Under section 307(b)(1) of the Act, judicial review of this final action may be sought only in the United States Court of Appeals for the District of Columbia Circuit. Petitions for review must be filed by September 8, 2009.

[232] 74 FR at 12159.

[233] *See Motor and Equipment Manufacturers Ass'n* v. *Nichols,* 142 F.3d 449, 462–63, 466–67 (DC Cir. 1998), *Motor and Equipment Manufacturers Ass'n* v. *EPA,* 627 F.2d 1095, 1111, 1114–20 (DC Cir. 1979).

[234] 36 FR 17458 (August 31, 1971).

[235] 43 FR 1829, 1833 (January 12, 1978), LEV I waiver decision document at 185–186.

Under section 307(b)(2) of the Act, judicial review of this final action may not be obtained in subsequent enforcement proceedings.

As with past waiver decisions, this action is not a rule as defined by Executive Order 12866. Therefore, it is exempt from review by the Office of Management and Budget as required for rules and regulations by Executive Order 12866.

In addition, this action is not a rule as defined in the Regulatory Flexibility Act, 5 U.S.C. 601(2). Therefore, EPA has not prepared a supporting regulatory flexibility analysis addressing the impact of this action on small business entities.

The Congressional Review Act, 5 U.S.C. 801 *et seq.,* as added by the Small Business Regulatory Enforcement Fairness Act of 1996, does not apply because this action is not a rule, for purposes of 5 U.S.C. 804(3).

Dated: June 30, 2009.

Lisa P. Jackson,

Administrator.

BILLING CODE 6560–50–P

8. Waste

Waste management and treatment activities are sources of greenhouse gas emissions (see Figure 8-1). Landfills accounted for approximately 23 percent of total U.S. anthropogenic methane (CH_4) emissions in 2007,[1] the second largest contribution of any CH_4 source in the United States. Additionally, wastewater treatment and composting of organic waste accounted for approximately 4 percent and less than 1 percent of U.S. CH_4 emissions, respectively. Nitrous oxide (N_2O) emissions from the discharge of wastewater treatment effluents into aquatic environments were estimated, as were N_2O emissions from the treatment process itself. N_2O emissions from composting were also estimated. Together, these waste activities account for approximately 2 percent of total U.S. N_2O emissions. Nitrogen oxide (NO_x), carbon monoxide (CO), and non-CH_4 volatile organic compounds (NMVOCs) are emitted by waste activities, and are addressed separately at the end of this chapter. A summary of greenhouse gas emissions from the Waste chapter is presented in Table 8-1 and Table 8-2.

Overall, in 2007, waste activities generated emissions of 165.6 teragrams of carbon dioxide equivalents (Tg CO_2 Eq.) or just over 2 percent of total U.S. greenhouse gas emissions.

Figure 8-1

2007 Waste Chapter Greenhouse Gas Emission Sources

Domestic Wastewater Treatment	3.7	4.0	4.5	4.8	4.8	4.9
Composting	0.4	0.8	1.4	1.7	1.8	1.8
Total	**177.1**	**174.7**	**154.6**	**160.2**	**163.0**	**165.6**

Note: Totals may not sum due to independent rounding.

[1] Landfills also store carbon, due to incomplete degradation of organic materials such as wood products and yard trimmings, as described in the Land Use, Land-Use Change, and Forestry chapter.

per capita flow = Wastewater flow to POTW per person per day (100 gal/person/day)

conversion to m^3 = Conversion factor, ft^3 to m^3 (0.0283)

$FRAC\_CH_4$ = Proportion CH_4 in biogas (0.65)

density of CH_4 = 662 (g CH_4/m^3 CH_4)

$1/10^9$ = Conversion factor, g to Gg

U.S. population data were taken from the U.S. Census Bureau International Database (U.S. Census 2008a) and include the populations of the United States, American Samoa, Guam, Northern Mariana Islands, Puerto Rico, and the U.S. Virgin Islands. Table 8-8 presents U.S. population and total BOD_5 produced for 1990 through 2007. The proportions of domestic wastewater treated onsite versus at centralized treatment plants were based on data from the 1989, 1991, 1993, 1995, 1997, 1999, 2001, 2003, and 2005 American Housing Surveys conducted by the U.S. Census Bureau (U.S. Census 2008b), with data for intervening years obtained by linear interpolation. The wastewater flow to aerobic and anaerobic systems, and the wastewater flow to POTWs that have anaerobic digesters were obtained from the 1992, 1996, 2000, and 2004 Clean Watershed Needs Survey (EPA 1992, 1996, 2000, and 2004a).[9] Data for intervening years were obtained by linear interpolation. The BOD_5 production rate (0.09 kg/capita/day) for domestic wastewater was obtained from Metcalf and Eddy (1991 and 2003). The CH_4 emission factor (0.6 kg CH_4/kg BOD_5) and the MCFs were taken from IPCC (2006). The CH_4 destruction efficiency, 99 percent, was selected based on the range of efficiencies (98 to 100 percent) recommended for flares in *AP-42 Compilation of Air Pollutant Emission Factors, Chapter 2.4* (EPA 1998), efficiencies used to establish NSPS for landfills, and in recommendations for closed flares used by the LMOP. The cubic feet of digester gas produced per person per day (1.0 ft^3/person/day) and the proportion of CH_4 in biogas (0.65) come from Metcalf and Eddy (1991).

[9] Aerobic and anaerobic treatment were determined based on unit processes in use at the facilities. Because the list of unit processes became more extensive in the 2000 and 2004 surveys, the criteria used to identify aerobic and anaerobic treatment differ slightly across the time series. Once facilities were identified as aerobic or anaerobic, they were separated by whether or not they had anaerobic digestion in place. Once these classifications were determined, the flows associated with facilities in each category were summed.

Table 8-8: U.S. Population (Millions) and Domestic Wastewater BOD_5 Produced (Gg)

Year	Population	BOD_5
1990	254	8,350
1995	271	8,895
2000	287	9,419
2001	289	9,509
2002	292	9,597
2003	295	9,685
2004	297	9,774
2005	300	9,864
2006	303	9,954
2007	306	10,043

Source: U.S. Census Bureau (2008a); Metcalf & Eddy 1991 and 2003.

The wastewater flow to a POTW (100 gal/person/day) was taken from the Great Lakes-Upper Mississippi River Board of State and Provincial Public Health and Environmental Managers (2004), "Recommended Standards for Wastewater Facilities (Ten-State Standards)."

Industrial Wastewater CH_4 Emission Estimates

CH_4 emissions estimates from industrial wastewater were developed according to the methodology described in IPCC (2006). Industry categories that are likely to produce significant CH_4 emissions from wastewater treatment were identified. High volumes of wastewater generated and a high organic wastewater load were the main criteria. The top five industries that meet these criteria are pulp and paper manufacturing; meat and poultry processing; vegetables, fruits, and juices processing; starch-based ethanol production; and petroleum refining. Wastewater treatment emissions for these sectors for 2007 are displayed in Table 8-9.

Table 8-10 contains production data for these industries.

Table 8-9: Industrial Wastewater CH_4 Emissions by Sector for 2007

	CH_4 Emissions (Tg CO_2 Eq.)	% of Industrial Wastewater CH_4
Pulp & Paper	4.1	48%
Meat & Poultry	3.6	43%
Petroleum Refineries	0.6	7%
Fruit & Vegetables	0.1	1%
Ethanol Refineries	0.1	1%
Total	**8.5**	**100%**

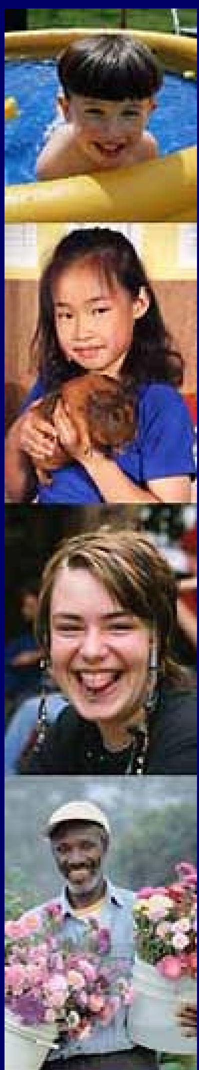
Water Use Facts



Water Use Facts

USDA Forest Service, Pacific Southwest Region

Facts About Water

- One acre foot=326,000 gallons. This covers an acre of land with a one-foot depth of water.
- Fresh water makes up only 2.8% of the water on the planet. The remaining 97.2% of the earth's water is salt water.

How much water do you use?

An average California household uses between one half-acre foot and one-acre foot of water each year.

Personal water use is highest in central valley cities, where a family may use as much as 300 gallons of water per person each day. Water use is as low as 50 gallons per person per day in some water-conserving coastal cities, such as San Francisco or Monterey.

How much water does it take to?

- **drink**, 1/2 gallon per person, per day
- **shower with a low-flow showerhead**, 9-12 gallons per person, per day
- **fill the bathtub**, about 36 gallons
- **cook**, 5-10 gallons per person, per day
- **wash clothes or the car**, 50 gallons per wash
- **water the lawn/yard**, 300 gallons per watering
- **flush the toilet**, 3.5 - 7 gallons, or 1.5 gallons with a water saving toilet

PILOT VERSION

LEED for Neighborhood Development Rating System

Developed through a partnership of the Congress for New Urbanism, Natural Resources Defense Council and the U.S. Green Building Council

Congress for the New Urbanism

NRDC
The Earth's Best Defense

Minor changes, including only corrected typos and minor clarifications, have been made to this version that were not included in the February 2007 version of the LEED for Neighborhood Development rating system. In addition, an alternative version of GCT Credit 9 (Stomwater Management) is provided with this version. Prerequisite and credit requirements were not changed in any way that would affect a project's ability to achieve them.

Table of Contents

Introduction

Overview

The U.S. Green Building Council (USGBC), the Congress for the New Urbanism (CNU), and the Natural Resources Defense Council (NRDC)—three organizations that represent some of the nation's leaders among progressive design professionals, builders, developers, and the environmental community—have come together to develop a national set of standards for neighborhood location and design based on the combined principles of smart growth, new urbanism, and green building. The goal of this partnership is to establish these standards for assessing and rewarding environmentally superior development practices within the rating framework of the LEED® (Leadership in Energy and Environmental Design) Green Building Rating System™.

Unlike other LEED products that focus primarily on green building practices, with relatively few credits regarding site selection and design, LEED for Neighborhood Development places emphasis on the design and construction elements that bring buildings together into a neighborhood, and relate the neighborhood to its larger region and landscape. The work of the committee is guided by sources such as the Smart Growth Network's ten principles of smart growth, the Charter of the New Urbanism, and other LEED rating systems. LEED for Neighborhood Development creates a label, as well as guidelines for design and decision-making, to serve as an incentive for better location, design, and construction of new residential, commercial, and mixed use developments.

The existing LEED for New Construction Rating System has a proven track record of encouraging builders to utilize green building practices, such as increasing energy and water efficiency and improving indoor air quality in buildings. It is the hope of the partnership that LEED for Neighborhood Development will have a similarly positive effect in encouraging developers to revitalize existing urban areas, reduce land consumption, reduce automobile dependence, promote pedestrian activity, improve air quality, decrease polluted stormwater runoff, and build more livable, sustainable, communities for people of all income levels.

How LEED Rating Systems Work

LEED provides rating systems that are voluntary, consensus-based, market-driven, grounded in accepted energy and environmental principles, and that strike a balance between established practices and emerging concepts. LEED rating systems are developed by committees, in adherence with USGBC policies and procedures guiding the development and maintenance of rating systems. LEED for Neighborhood Development is one of a growing portfolio of rating systems serving specific market sectors.

LEED rating systems typically consist of a few prerequisites and many credits. In order to be certified, a project must meet each prerequisite. Each credit is optional, but achievement of each credit contributes to the project's point total. A minimum point total is required for certification, and higher point scores are required for silver, gold, or platinum LEED certification.

What is a "Neighborhood Development"?

The rating system is designed to certify exemplary development projects that perform well in terms of smart growth, new urbanism, and green building. Projects may constitute whole neighborhoods, fractions of neighborhoods, or multiple neighborhoods. Smaller, infill projects that are single use but complement existing neighboring uses should be able to earn certification as well as larger and mixed use developments.

The LEED for Neighborhood Development Pilot Program

Up to 120 projects in total will be selected to be a part of the pilot program. The objective of the pilot program is to ensure that the rating system is practical for application and is an effective tool for recognizing projects that incorporate smart growth, new urbanist, and green building practices. The LEED for Neighborhood Development Core Committee will assess the experience gained from the pilot program in order to revise the rating system for public comment and ballot.

LEED for Neighborhood Development's principal aim is to improve land-use patterns, neighborhood design, and technology in the United States. However, on a very limited basis, the pilot program may test the applicability of the rating system in non-United States settings as well.

In terms of eligibility for the pilot program, there is no minimum or maximum for project size and no strict definition for what would comprise a neighborhood. The only requirement is that projects must be able to meet all prerequisites and anticipate that the minimum number of points through credits to achieve certification can be earned.

Certification Process

LEED for Neighborhood Development will certify projects that may have significantly longer construction periods than single buildings, and as a result the standard LEED certification process needed to be modified. The core committee wanted to be able to provide developers of certifiable projects with some form of approval even at the early, pre-entitlement stage. They also wanted to ensure that great plans became great real-life projects. With these goals in mind, the core committee created the following three-stage certification process:

Optional Pre-review (Stage 1)

This stage is available but not required for projects at any point before the entitlement process begins. If pre-review approval of the plan is achieved, USGBC will issue a letter stating that if the project is built as proposed, it will be able to achieve LEED for Neighborhood Development certification. The purpose of this letter is to assist the developer in building a case for entitlement among land use planning authorities, as well as a case for financing and occupant commitments.

Certification of an Approved Plan (Stage 2)

This stage is available after the project has been granted any necessary approvals and entitlements to be built to plan. Any changes to the pre-reviewed plan that could potentially affect prerequisite or credit achievement would be communicated to USGBC as part of this submission. If certification of the approved plan is achieved, USGBC will issue a certificate stating that the approved plan is a LEED for Neighborhood Development Certified Plan and will list it as such on the USGBC website.

Certification of a Completed Neighborhood Development (Stage 3)

This step takes place when construction is complete or nearly complete. Any changes to the certified approved plan that could potentially affect prerequisite or credit achievement would be communicated to USGBC as part of this submission. If certification of the completed neighborhood development is achieved, USGBC will issue plaques or similar awards for public display at the project site and will list it as such on the USGBC website.

Similar to other LEED certification processes, projects will be provided with a more thorough explanation of credit topics and calculations in a reference guide. Project teams will be required to submit documentation for each credit as described in the "submittal" sections of the rating system. Pilot participants will be given submittal templates to fill out as part of documentation after they register their project. The templates will assist projects in providing the requested calculations. The submittal section included with each credit in the rating system is subject to modification during the course of the pilot program. During the pilot program, project teams are encouraged to suggest replacement documentation that clearly verifies that the requirements have been met but may be easier to access or produce than the items listed below. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

Acknowledgements

The partnership would like to thank the following funders for their support of the creation of LEED for Neighborhood Development (listed alphabetically):

The Blue Moon Fund
Centers for Disease Control
EDAW
U.S. EPA Office of Brownfields Cleanup and Redevelopment
U.S. EPA Development, Community, and Environment Division
The Johnson Foundation
National Endowment for the Arts

The pilot version of the LEED for Neighborhood Development Rating System has been made possible because of the efforts of many dedicated volunteers, staff members, consultants, and others in the USGBC, CNU, and NRDC communities. The partnership extends its deepest gratitude to all of these individuals, and especially to the LEED for Neighborhood Development Core Committee members selected by the partners, for their tireless volunteer efforts in developing this rating system. They are:

Doug Farr (Chair), Farr Associates
Kaid Benfield (Vice-Chair), Natural Resources Defense Council

Project Checklist

Smart Location & Linkage — 30 Possible Points

Prereq 1	**Smart Location**	Required
Prereq 2	**Proximity to Water and Wastewater Infrastructure**	Required
Prereq 3	**Imperiled Species and Ecological Communities**	Required
Prereq 4	**Wetland and Water Body Conservation**	Required
Prereq 5	**Agricultural Land Conservation**	Required
Prereq 6	**Floodplain Avoidance**	Required
Credit 1	**Brownfield Redevelopment**	2
Credit 2	**High Priority Brownfields Redevelopment**	1
Credit 3	**Preferred Locations**	2-10
Credit 4	**Reduced Automobile Dependence**	1-8
Credit 5	**Bicycle Network**	1
Credit 6	**Housing and Jobs Proximity**	3
Credit 7	**School Proximity**	1
Credit 8	**Steep Slope Protection**	1
Credit 9	**Site Design for Habitat or Wetlands Conservation**	1
Credit 10	**Restoration of Habitat or Wetlands**	1
Credit 11	**Conservation Management of Habitat or Wetlands**	1

Neighborhood Pattern & Design — 39 Possible Points

Prereq 1	**Open Community**	Required
Prereq 2	**Compact Development**	Required
Credit 1	**Compact Development**	1-7
Credit 2	**Diversity of Uses**	1-4
Credit 3	**Diversity of Housing Types**	1-3
Credit 4	**Affordable Rental Housing**	1-2
Credit 5	**Affordable For-Sale Housing**	1-2
Credit 6	**Reduced Parking Footprint**	2
Credit 7	**Walkable Streets**	4-8
Credit 8	**Street Network**	1-2
Credit 9	**Transit Facilities**	1
Credit 10	**Transportation Demand Management**	2
Credit 11	**Access to Surrounding Vicinity**	1
Credit 12	**Access to Public Spaces**	1
Credit 13	**Access to Active Public Spaces**	1
Credit 14	**Universal Accessibility**	1
Credit 15	**Community Outreach and Involvement**	1
Credit 16	**Local Food Production**	1

Green Construction & Technology — 31 Possible Points

Prereq 1	**Construction Activity Pollution Prevention**	Required
Credit 1	**Certified Green Buildings**	1-3
Credit 2	**Energy Efficiency in Buildings**	1-3
Credit 3	**Reduced Water Use**	1-3
Credit 4	**Building Reuse and Adaptive Reuse**	1-2
Credit 5	**Reuse of Historic Buildings**	1

Credit 6	**Minimize Site Disturbance through Site Design**	1
Credit 7	**Minimize Site Disturbance during Construction**	1
Credit 8	**Contaminant Reduction in Brownfields Remediation**	1
Credit 9	**Stormwater Management**	1-5
Credit 10	**Heat Island Reduction**	1
Credit 11	**Solar Orientation**	1
Credit 12	**On-Site Energy Generation**	1
Credit 13	**On-Site Renewable Energy Sources**	1
Credit 14	**District Heating and Cooling**	1
Credit 15	**Infrastructure Energy Efficiency**	1
Credit 16	**Wastewater Management**	1
Credit 17	**Recycled Content in Infrastructure**	1
Credit 18	**Construction Waste Management**	1
Credit 19	**Comprehensive Waste Management**	1
Credit 20	**Light Pollution Reduction**	1

Innovation & Design Process — 6 Possible Points

Credit 1	**Innovation in Design**	1-5
Credit 2	**LEED Accredited Professional**	1

Project Totals — 106 Possible Points

Certification Levels:

Certified 40-49 points
Silver 50-59 points
Gold 60-79 points
Platinum 80-106 points

Smart Location & Linkage

SLL Prerequisite 1: Smart Location

Required

Intent

Encourage development within and near existing communities or public transportation infrastructure. Reduce vehicle trips and miles traveled and support walking as a transportation choice.

Requirements

OPTION 1

Locate the **project** on an **infill site**;

OR

OPTION 2

Locate the project near existing or planned **adequate transit service** so that at least 50% of dwelling units and business entrances within the project are within ¼ mile **walk distance** of bus or streetcar stops or within ½ mile walk distance of bus rapid transit stops, light or heavy passenger rail stations and ferry terminals. In the case of planned service, show that the relevant transit agency has committed in a legally binding warrant that **adequate transit service** will be provided at or before the beginning of the transit agency's first service year after 50% of the dwelling units and/or businesses within the project are occupied and has identified all funding necessary to do so;

OR

OPTION 3

Locate the project near existing neighborhood shops, services, and facilities so that the **project boundary** is within ¼ mile walk distance of at least four, or within ½ mile walk distance of at least 6, of the **diverse uses** defined in Appendix A. Uses may not be counted in two categories, e.g an office building may be counted only once even if it is also a major employment center. A mixed use building containing several uses as distinct enterprises would count each as a separate use, but no more than half of the minimum number of diverse uses can be situated in a single building. A single retail store of any type (such as a big box retail store that sells both clothing and household goods) may only be counted once even if it sells products associated with multiple use types;

OR

OPTION 4

Locate the project within a region served by a Metropolitan Planning Organization (MPO) and within a transportation analysis zone for which MPO research demonstrates that the average annual home-based and/or non-home-based rate of **Vehicle Miles Traveled (VMT)** per capita is lower than the average annual rate of the metropolitan region as a whole. The research must be derived from transportation surveys conducted within ten years of the date of submission for LEED for Neighborhood Development certification;

OR

OPTION 5

Locate the project within a region served by a Metropolitan Planning Organization (MPO) and demonstrate through peer-reviewed analysis that the average annual home-based and/or non-home-based rate of Vehicle Miles Traveled (VMT) per capita of the project will be lower than the average annual rate shown by MPO research for the metropolitan region as a whole. The MPO research must be derived from transportation surveys conducted within ten years of the date of submission for LEED for Neighborhood Development certification. The analysis prepared for the project must be conducted by a qualified transportation professional and reviewed and supported by a second qualified transportation professional who is not affiliated with either the sponsor of the project or the first analyst.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1:

- ❑ A map of the vicinity demonstrating that the project is located on an infill site.

Option 2:

- ❑ A site and/or vicinity map showing all dwelling units and relevant building entrances, transit stops, and walking routes to those stops.
- ❑ A table of walk distances between each dwelling unit or business entrance and the closest transit stop, and a calculation of the percentage of dwelling units and business entrances that lie within the specified distances.
- ❑ Schedules or a brief narrative indicating the frequency and type of transit available.
- ❑ For planned transit routes, provide documents from the relevant transit authority indicating when service will be instituted and the source of funding.

Option 3:

- ❑ A site and/or vicinity map showing the project's boundary and walking routes to any uses listed in Appendix A.

- ❑ A table of walk distances between the project boundary and each relevant use listed in Appendix A.

Option 4:

- ❑ Excerpts of relevant MPO research.

Option 5:

- ❑ Confirmation of which MPO the project is located within.
- ❑ VMT analysis, with relevant conclusions highlighted, and the sources of peer-review listed.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1
If the project submitted at Stage 1, and project conditions remain unchanged with respect to prerequisite requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1
If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2
If project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2
If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Prerequisite 2: Proximity to Water and Wastewater Infrastructure

Required

Intent

Encourage new development within and near existing communities in order to reduce multiple environmental impacts caused by sprawl. Conserve natural and financial resources required for construction and maintenance of infrastructure.

Requirements

OPTION 1

Locate the **project** on a site served by existing water and wastewater infrastructure. Replacement or other on-location improvements to existing infrastructure are considered *existing* for the purpose of achieving this option;

OR

OPTION 2

Locate the project within a legally adopted planned water and wastewater service area and provide new water and wastewater infrastructure for the project.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A site and/or vicinity map indicating the location of existing water and wastewater infrastructure.

Option 2

- ❑ A map showing the planned water and wastewater service areas, and/or a letter from the relevant public authority stating that the project site lies within planned water and wastewater service areas.
- ❑ A brief narrative explaining the new infrastructure that the project team or sponsor commits to providing or funding if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to prerequisite requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Prerequisite 3: Imperiled Species and Ecological Communities Required

Intent

Protect imperiled species and ecological communities.

Requirements

Check with the state Natural Heritage Program, and any local wildlife agencies to determine if species listed under the federal Endangered Species Act, the state's endangered species act, or species or ecological communities classified by NatureServe as G1 (critically imperiled) or G2 (imperiled), have been found on the site or have a high likelihood of occurring on the site due to the presence of suitable habitat and nearby occurrences. If no such species have been found or have a high likelihood of being present, the prerequisite is achieved. If any such species have been found or have a high likelihood of being present, meet the requirements of Option 1 or Option 2 set forth below.

OPTION 1

Comply with an approved Habitat Conservation Plan (HCP) under the Endangered Species Act for each identified species or ecological community;

OR

OPTION 2

If no approved HCP exists for an identified species or ecological community, then coordinate with the state's Natural Heritage Program or fish and wildlife agency to perform adequate surveys of imperiled species and ecological communities. If a survey finds that an imperiled species or ecological community is present, the project applicant shall do the following:

a. Work with a qualified biologist, a non-governmental conservation organization or the appropriate state, regional or local agency to identify and map the geographic extent of the habitat and identify an appropriate buffer of no less than 100 feet around the habitat that ensures the protection of the imperiled species or ecological community.

b. Protect the habitat and buffer or setback area from development in perpetuity by donating or selling the land or a conservation easement on the land to an accredited land trust or relevant public agency.

c. Work with ecologists to analyze the threats from development of the proposed project and develop a management plan that eliminates or significantly mitigates the identified threats.

Additional Notes

G1 species are critically imperiled; at very high risk of extinction globally due to extreme rarity (often five or fewer populations), very steep declines, or other factors.

G2 species are imperiled; at high risk of extinction globally due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.

NatureServe (www.natureserve.org) is a non-profit conservation organization that provides the scientific information and tools needed to help guide effective conservation action. It represents an international network of biological inventories—known as natural heritage programs or conservation data centers—operating in all 50 U.S. states, Canada, Latin America and the Caribbean. "G1" and "G2" are part of a classification system developed in the early 1970s by the Nature Conservancy's network of natural heritage programs in every state. NatureServe currently maintains the network of natural heritage program, the classification system, and the data on biodiversity. NatureServe uses a number of criteria in assessing the status of species, including the number of populations, the size of populations, the viability of the species occurrences, the trends in population numbers, and the threats to species.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

All Options

- ❑ Results of inquiries to the state Natural Heritage Program and any local wildlife agencies as to whether listed endangered species or G1 or G2 ecological communities occur or have a high likelihood of occurring on the project site.

Option 1

- ❑ A map showing the geographic extent of the HCP and the project's location within it.
- ❑ A brief narrative describing how the project will meet the requirements of the HCP.

Option 2

- ❑ Information about the site received from the relevant natural heritage program or agency.
- ❑ The results of site surveys.
- ❑ If imperiled species or ecological communities are found, submit a) a site plan which delineates imperiled species habitat in relation to the project; b) a letter from the

accredited land trust or relevant public agency stating that a transfer of land rights for the habitat and buffer has taken place or will take place if the project is built, such that these areas will be protected in perpetuity; and c) a brief narrative explaining how imperiled species and ecological communities will be protected.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to prerequisite requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Prerequisite 4: Wetland and Water Body Conservation
Required

Intent

Conserve water quality, natural hydrology and habitat and preserve biodiversity through conservation of water bodies or wetlands.

Requirements

OPTION 1 – FOR SITES WITH NO WETLANDS OR WATER BODIES

Locate the **project** on a site that includes no **wetlands**, **water bodies**, or land within 100 feet of these areas;

OR

OPTION 2 – FOR PREVIOUSLY DEVELOPED SITES WITH WETLANDS/WATER BODIES

Locate the project on a **previously developed site** where the area within a 1 mile radius from the perimeter of the site has either a) an average **street grid density** of at least 30 centerline miles per square mile, or b) an average built **density** of at least 30 dwelling units per acre for any residential components and 1.5 **FAR** for any non-residential components. If local, state, and federal regulations permit impacts to any on-site wetlands, water bodies, or buffer land that is within 100 feet of these areas, such impacts must be compensated by on-site or off-site wetland restoration of equal or greater amounts;

OR

OPTION 3 – FOR ALL OTHER SITES

If the project is located on a site that includes wetlands, water bodies, or land within 100 feet of these areas, and if local, state, and federal regulations permit impacts to any on-site wetlands, water bodies, or buffer land that is within 100 feet of these areas, limit any impacts to less than the percentage of these areas reflected in either one of the two following tables, and compensate by on-site or off-site wetland restoration of equal or greater amounts. The portion of the site that is impacted must incorporate stormwater best management practices within the impacted area to infiltrate, re-use, or evapotranspirate at least 90% of the average annual rainfall or 1” of rainfall from 75% of the **development footprint** within the impacted area.

Street grid density within a 1 mile radius from the perimeter of the site boundary	Percentage of on-site impacts allowed
>20	15
10-20	10
<10	5

Residential **density** (DU/acre)	Non-residential density (**FAR**)	Percentage of on-site impacts allowed
>20	>1.0	15
10-20	.75 - 1.0	10
< 10	< .75	5

For all Options, minor development within the buffer may be undertaken in order to enhance appreciation for wetlands and water bodies. Such development may only include minor path-ways, limited pruning and tree removal for safety, habitat management activities, educational structures not exceeding 200 square feet, and small clearings for picnic tables, benches, and non-motorized recreational water crafts.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A site and/or vicinity map demonstrating that there are no wetlands, water bodies, or land within 100 feet of these areas.

  OR

- ❑ Declaration that there are no wetlands or water bodies.

Options 2 and 3

- ❑ A site and/or vicinity map showing a) any previously developed areas of the site; b) the street grid density or built density of the area within a 1 mile radius of the perimeter of the project site; and c) the construction impact zone; and d) the location of any wetlands, water bodies, or land within 100 feet of these areas.
- ❑ A calculation of either street grid density or built density within a 1 mile radius of the perimeter of the project site.
- ❑ If on-site impacts occur, a brief narrative describing the planned compensating wetland restoration activities, including the size of the impacted wetlands and of the restored wetlands. For Option 3, also include a narrative describing the stormwater best management practices employed and the amount of rainfall that will be captured.

Option 3

- ❑ A site plan indicating the portion of the site that is impacted, and the location of any BMPs.

- ❑ A written commitment to incorporate BMPs within the impacted area to meet the requirements if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to prerequisite requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

Options 2 and 3

- ❑ If wetland restoration activities took place, either a photograph, diagram, or a brief description of the resulting areas.

Option 3

- ❑ For portions of the site where BMPs were required, a calculation of either 90% of the average annual rainfall or 1" of rainfall that occurs on the project's development footprint and other effectively impervious areas.
- ❑ A calculation of the percentage of the development footprint for which runoff is infiltrated, re-used, or evapotranspirated.

Case 3B: Change since Stage 2

If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Smart Location & Linkage

SLL Prerequisite 5: Agricultural Land Conservation
Required

Intent

Preserve irreplaceable agricultural resources by protecting prime and unique farmland and forest lands from development.

Requirements

OPTION 1

Locate the **project** such that the site contains no more than 25% **prime soils**, **unique soils**, or soils of state significance as identified in a state Natural Resources Conservation Service soil survey;

OR

OPTION 2

Locate the project such that it meets the requirements specified in Options 1, 2, or 3, of SLL Prerequisite 1;

OR

OPTION 3

Locate the project such that it is within a designated receiving area for development rights under a publicly administered farmland protection program that provides for the transfer of development rights from lands designated for conservation to lands designated for development;

OR

OPTION 4 – FOR REGIONS WITH AN ABUNDANCE OF PRIME AGRICULTURAL LAND

If the project is located within a metropolitan or micropolitan statistical area for which 75% or more of the total vacant land, including **infill sites**, is covered by prime soils, unique soils, or soils of state significance, and is on an **adjacent site**, then the prerequisite is not applicable. If the project does not lie in an established metropolitan or micropolitan statistical area, then the county boundary may serve for the purposes of the calculation.

Additional Notes

The Natural Resources Conservation Service (NRCS) is responsible for identifying prime and unique soils, and they make detailed soil surveys and maps available for every county in the United States. NRCS data are available for download to GIS mapping programs.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A site and/or vicinity map indicating the location of any prime or unique soils on the site.

  OR

- ❑ Declaration that there are no prime or unique soils on the site.
- ❑ If any prime, unique, or state significant soils occur on the site, a calculation of the percentage of the site area that they cover.

Option 2

- ❑ No additional documentation necessary.

Option 3

- ❑ A brief description and/or map indicating the receiving area for development rights.

Option 4

- ❑ Data and/or a map showing that 75% of the total vacant land in the metropolitan or micropolitan statistical area (or county) is covered by prime soils, unique soils, or soils of state significance.
- ❑ A site and/or vicinity map showing that the project site is an adjacent site.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to prerequisite requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

Case 3B: Change since Stage 2

If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Smart Location & Linkage

SLL Prerequisite 6: Floodplain Avoidance
Required

Intent

Protect life and property, promote open space and habitat conservation, and enhance water quality and natural hydrological systems.

Requirement

OPTION 1- FOR SITES WITH NO 100-YR FLOODPLAINS

Locate on a site that does not contain any land within the 100-year floodplain as defined and mapped by the Federal Emergency Management Agency or state or local floodplain management entity, whichever has been done most recently;

OR

OPTION 2- FOR INFILL AND PREVIOUSLY DEVELOPED SITES

Locate the **project** on an **infill site** or a **previously developed site** and follow the National Flood Insurance Program (NFIP) requirements for developing any portions of the site that lie within the 100-year floodplain as defined and mapped by the Federal Emergency Management Agency or state or local floodplain management entity, whichever has been done most recently;

OR

OPTION 3- FOR ALL OTHER SITES

For projects where part(s) of the site is located within the 100-year floodplain as defined and mapped by the Federal Emergency Management Agency or state or local floodplain management entity, whichever has been done most recently, develop only on portions of the site that are not in the 100-year floodplain or on portions that have been previously developed. Previously developed portions in the floodplain must be developed according to the NFIP requirements.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A site and/or vicinity map indicating that the site contains no land within the 100-year floodplain.

  OR

- ❑ Declaration that the site contains no land within the 100-year floodplain.

Option 2

- ❑ A site and/or vicinity map indicating that the project is an infill site or areas that are previously developed.
- ❑ If any portion of the site lies within the 100-year floodplain, submit a brief narrative describing how the NFIP requirements will be met for that portion.

Option 3

- ❑ A site and/or vicinity map indicating where new development will take place, areas that are previously developed, and the boundaries of the 100-year floodplain.
- ❑ If any portion of the site that is being redeveloped lies within the 100-year floodplain, submit a brief narrative describing how the NFIP requirements will be met for that portion.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to prerequisite requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Credit 1: Brownfields Redevelopment
2 Points

Intent

Encourage the reuse of land by developing sites where development is complicated by environmental contamination, reducing pressure on undeveloped land.

Requirements

Locate **project** on a site, part or all of which is documented as contaminated (by means of an ASTM E1903-97 Phase II Environmental Site Assessment or a local Voluntary Cleanup Program) OR on a site defined as a **brownfield** by a local, state or federal government agency;

AND

Remediate site contamination such that the controlling public authority approves the protective measures and/or clean-up as effective, safe, and appropriate for the future use of the site.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- Confirmation of whether any part of the project site was determined contaminated by means of an ASTM E1903-97 Phase II Environmental Site Assessment or defined as a brownfield by a local, state, or federal agency.
- Narrative describing the site contamination and remediation efforts undertaken or to be undertaken by the project.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ Confirmation from the controlling public authority that it has approved the remediation as effective, safe, and appropriate for the future use of the site.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Smart Location & Linkage

SLL Credit 2: High Priority Brownfields Redevelopment
1 Point

Intent

Encourage the cleanup of contaminated **brownfields** sites in areas targeted for redevelopment.

Requirements

Earn SLL Credit 1: Brownfields Redevelopment, using a site that is in one of the following areas:

- Federal Empowerment Zone
- Federal Enterprise Community
- Federal Renewal Community
- Communities with Official Recognition (OR) from the Department of Justice for their Weed and Seed Strategy
- Qualified Low-Income Communities (LICs) as defined by the New Markets Tax Credit (NMTC) Program of the U.S. Department of the Treasury - Community Development Financial Institutions Fund (CDIF).

Brownfield sites in areas identified by state level equivalent programs to those listed above will also qualify.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ Documentation demonstrating that the site lies within one of the listed zones or communities.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Credit 3: Preferred Locations
2 to 10 Points

Intent

Encourage development within existing communities and developed places to reduce multiple environmental harms associated with sprawl. Reduce development pressure beyond the limits of existing development. Conserve natural and financial resources required for construction and maintenance of infrastructure.

Requirements

Locate the **project** in one of the following locations that also earn at least one point for **street grid density** according to the calculation below:

- An **infill site** that is also a **previously developed site** (6 points)
- An infill site that is not a previously developed site (4 points)
- An **adjacent site** that is also a previously developed site (3 points)
- A previously developed site that is not an adjacent or infill site (2 points)
- An adjacent site that is not a previously developed site (1 point)

AND

Calculate the street grid density (in street centerline miles per square mile) within a 1 mile radius from the perimeter of the site boundary. Points are added to the above points according to the following street grid density:

- 40 centerline miles per square mile or greater (4 points)
- 30-39 centerline miles per square mile (3 points)
- 20-29 centerline miles per square mile (2 points)
- 10-19 centerline miles per square mile (1 point)

No points are available under this credit for sites that are not either 1) an adjacent site, 2) an infill site, or 3) a previously developed site.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A map of the vicinity demonstrating that the project is located on one or more of the following: 1) an infill site; 2) an adjacent site; or 3) a previously developed site.
- ❑ A map of the vicinity showing the street grid density of the area within a 1 mile radius of the perimeter of the project site.
- ❑ A calculation of the street grid density within a 1 mile radius of the perimeter of the project site.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Credit 4: Reduced Automobile Dependence
1 to 8 Points

Intent

Encourage development in locations that exhibit superior performance in providing transportation choices or otherwise reducing motor vehicle use.

Requirements

OPTION 1

Locate **project** on a site with transit service of 20 or more easily accessible transit rides per week day. The number of points available for increasing transit service is indicated in the table below. The total number of rides available during weekdays is defined as the number of buses or streetcars stopping within a ¼ mile **walk distance** of at least 50% of the project's dwellings and business entrances, and the number of bus rapid transit buses, light rail trains, heavy passenger rail, and ferries stopping within a ½ mile walk distance of at least 50% of the project's dwellings and business entrances;

Total rides available per weekday	Points earned
20 – 59	2
60 – 99	3
100 – 224	4
225 – 349	5
350 – 499	6
500 or more	7

OR

OPTION 2

Locate project within a region served by a Metropolitan Planning Organization AND within a transportation analysis zone where annual **Vehicle Miles Traveled (VMT)** per capita or single occupancy vehicle (SOV) driving mode share has been demonstrated by MPO research derived from a household transportation survey to be no more than 80% of the average of the metropolitan region as a whole. The research must be derived from transportation surveys conducted within ten years of the date of submission for LEED for Neighborhood Development certification. Additional credit may be awarded for increasing levels of performance, as indicated;

Percent of average regional per capita VMT or SOV mode share	Points earned
71% to 80%	2
61% to 70%	3
51% to 60%	4
41% to 50%	5
31% to 40%	6
30% or less	7

OR

OPTION 3

Locate the project such that 50% of the dwelling units and business entrances are within a ¼ mile walk distance of at least one vehicle that is available through a vehicle-sharing program, and publicize the availability and benefits of the vehicle-sharing program to project occupants. If the project will add more than 100 dwelling units and/or employees to the neighborhood, at least one additional vehicle for every 100 dwelling units and/or employees must be available and the parking space must be dedicated as part of the project. Where new vehicle locations are created, a vehicle share program must commit to providing a vehicle to the location for at least three years. (1 point)

Points earned under Options 1 and 2 may not be combined. A point from Option 3 may be earned independently, or be added to those earned under Options 1 and 2 for a maximum of 8 points.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A site and/or vicinity map showing all relevant dwelling units and building entrances, transit stops, and walking routes to those stops.
- ❑ Schedules or a brief narrative indicating the frequency and type of transit available.
- ❑ A list of transit stops that lie within the specified walk distance of 50% of the project's dwelling units and business entrances.

- ❑ A calculation showing the total rides available per weekday.

Option 2

- ❑ Excerpts of relevant MPO research.

Option 3

- ❑ A site and/or vicinity map showing all relevant building entrances, shared vehicles, and walking routes to those vehicles.
- ❑ A table of walk distances between each dwelling unit and/or business entrance and the closest shared vehicle, and a calculation of the percentage of dwelling units and business entrances that lie within the specified distances.
- ❑ A brief narrative describing how the availability of the vehicle-sharing program will be publicized to project occupants.
- ❑ If the project adds more than 100 dwelling units or employees to the neighborhood, submit calculations showing how many additional vehicles are required and indicate on the site plan where any required parking spaces are dedicated within the project.
- ❑ If a new vehicle location is created to meet the requirements, submit a letter from the vehicle-sharing program stating its commitment to provide a vehicle at that location for at least 3 years.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

<u>Case 2B: Change since Stage 1</u>

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 3A: No change since Stage 2</u>

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

<u>Case 3B: Change since Stage 2</u>

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Credit 5: Bicycle Network
1 Point

Intent

To promote bicycling and transportation efficiency.

Requirements

Design or locate the **project** such that 50% of the dwelling units and business entrances are within 3 miles of at least four or more of the diverse uses listed in Appendix A using an existing **biking network** and/or a biking network that will be completed as part of the project (3 mile distance is measured along the biking network, not as a straight radius);

AND

For any non-residential buildings and multifamily residential buildings that are part of the project, provide bicycle parking spaces or storage for a capacity of no less than 15% of the off-street parking space capacity provided for cars for those buildings.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site and/or vicinity map indicating the relevant building entrances, diverse uses listed in Appendix A, and biking network.
- ❑ A table of biking distances between each dwelling unit or business entrance and each relevant use listed in Appendix A, and a calculation of the percentage of dwelling units and business entrances that lie within the specified distance.
- ❑ If non-residential buildings or multifamily residential buildings are included in the project, submit a calculation of the required bicycle parking spaces and indicate their location on the site plan.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Credit 6: Housing and Jobs Proximity
3 Points

Intent

Encourage balanced communities with a diversity of uses and employment opportunities. Reduce energy consumption and pollution from motor vehicles by providing opportunities for shorter vehicle trips and/or use of alternative modes of transportation.

Requirements

OPTION 1

Include a residential component equaling at least 25% of the **project**'s total building square footage, and locate and/or design the project such that the center is within a 1/2 mile **walk distance** of a number of **pre-project** jobs equal to or greater than 50% of the number of dwelling units in the project;

OR

OPTION 2

Include a non-residential component equaling at least 25% of the project's total building square footage, and locate on an **infill** site whose center is within a ½ mile walk distance of an existing and operational rail transit stop, and within a ½ mile walk distance of a number of existing dwelling units equal to or greater than 50% of the number of new jobs created as part of the project.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A calculation demonstrating that at least 25% of the project's built square footage is residential.

- ❑ A site and/or vicinity map showing the location of relevant dwelling units within the project, nearby pre-project jobs, and walking routes to those jobs.
- ❑ A calculation showing that the number of pre-project jobs is equal to or greater than 50% of the number of dwelling units.

Option 2

- ❑ A calculation demonstrating that at least 25% of the project's built square footage is non-residential.
- ❑ A site and/or vicinity map demonstrating that the project site is an infill site, and indicating the location of the relevant rail transit stop, existing dwelling units, new jobs created as part of the project, and walking routes to the transit stop and dwelling units.
- ❑ A calculation showing that the number of pre-project jobs is equal to or greater than 50% of the number of dwelling units.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Credit 7: School Proximity
1 Point

Intent

Promote public health through physical activity by facilitating walking to school. Promote community interaction and engagement.

Requirements

Include a residential component in the **project** that constitutes at least 25% of the project's total building square footage; and locate or design the project so that at least 50% of the project's dwelling units are within ½ mile **walk distance** of an existing or planned school.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A calculation demonstrating that at least 25% of the project's square footage is residential.
- ❑ A site and/or vicinity map showing the relevant school, dwelling units, and walking routes.
- ❑ A table of walk distances between each dwelling unit the relevant school, and a calculation of the percentage of dwelling units that lies within the specified distance.
- ❑ If the school is planned rather than existing, submit a letter signed by the school district or academic institution confirming that a school will be constructed at the identified location.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1
If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2
If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2
If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Credit 8: Steep Slope Protection
1 Point

Intent

Minimize erosion to protect habitat and reduce stress on natural water systems by preserving steep slopes in a natural, vegetated state.

Requirements

OPTION 1

Avoid disturbing portions of **project** sites that have **pre-project** slopes greater than 15%;

OR

OPTION 2- FOR **PREVIOUSLY DEVELOPED SITES** ONLY

On portions of project sites with pre-project slopes greater than 15%:

a. treat any fractions of the site that have not been previously developed by complying with the requirements for sites that are not previously developed set forth in Option 3;

   OR

b. restore **native plants** or **adapted plants** to 100% of any **previously developed** slopes over 40%; 60% of any previously developed slopes between 25%-40%; and 40% of any previously developed slopes between 15%-25%;

OR

OPTION 3

On portions of project sites with pre-project slopes greater than 15% that are <u>not</u> previously developed sites:

- do not disturb slopes greater than 40% and do not disturb portions of the project site within 50 feet of the top of the slope, and 75 feet from the **toe of the slope**;
- limit development to no more than 40% of slopes between 25%-40%, and to no more than 60% of slopes between 15%-25%.
- locate development such that the percentage of the **development footprint** that is on pre-project slopes less than 15% is greater than the percentage of **buildable land** that has pre-project slopes less than 15%.

For all three options, those portions of project sites with slopes up to 20 feet in elevation (toe to top) that are more then 30 feet in any direction from another slope greater than 15% are exempt from the requirements, although more restrictive local regulations may apply.

For Options 2 and 3, develop **CC&Rs**, development agreements, or other binding documents that will protect the specified steep slope areas in perpetuity.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

All Options

- ❑ Topographic drawings of the project site indicating slopes, any areas that are previously developed, and the areas planned for development or redevelopment.

Option 1

- ❑ Declaration that there are no pre-project slopes greater than 15%.

Option 2a

- ❑ Calculations showing that portions of the site that have not been previously developed are complying with the percentage requirements set forth in Option 3.

Option 2b

- ❑ A site plan indicating areas planned for restoration (or indicate these areas on the topographic drawings).
- ❑ A list of plants to be used.

Option 3

- ❑ Calculations showing that the site is complying with the percentage requirements.

Options 2a and 3

- ❑ A copy of, or a written commitment to create, any necessary CC&Rs, development agreements, or other binding documents that will restrict development around slopes according to the relevant credit requirements. If jurisdictional regulations provide for these restrictions, a copy of the relevant passages can be substituted.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ For Options 2a and 3, if written commitments to create copies of the required agreements were submitted previously, submit a copy of the actual agreement(s).
- ❑ For Option 2b, either a photograph, diagram, or a brief description of the restored areas.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Smart Location & Linkage

SLL Credit 9: Site Design for Habitat or Wetland Conservation
1 Point

Intent

Conserve native wildlife habitat, wetlands and water bodies.

Requirements

OPTION 1

Work with the state's Natural Heritage Program, a local fish or wildlife agency, or the state fish and wildlife agency to determine if significant habitat occurs on the site. If significant habitat is found, do not disturb that significant habitat or portions of the site within an appropriate buffer around the habitat. The geographic extent of the habitat and the appropriate buffer shall be identified by a qualified biologist, a non-governmental conservation organization or the appropriate state, regional or local agency. Protect significant habitat and its identified buffers from development in perpetuity by donating or selling the land or a conservation easement on the land to an accredited land trust or relevant public agency. Significant habitat for this credit includes:

- Habitat for species that are listed or are candidates for listing under state or federal endangered species acts, or for those classified as G1, G2, G3 and/or S1 and S2 species by NatureServe (see note below about G and S classification); and
- Locally or regionally significant habitat, or patches of natural vegetation at least 150 acres in size (irrespective of whether some of the 150 acres lies outside the **project boundary**); and
- Habitat flagged for conservation under a regional or state conservation or green infrastructure plan;

OR

OPTION 2

If the project is located on a **previously developed site**, use **native plants** for 90% of vegetation, and use no **invasive plants** on any part of the site;

OR

OPTION 3 – FOR SITES WITH WETLANDS AND/OR WATER BODIES

Design the project to conserve 100% of all **water bodies** and **wetlands** on the site; and conduct an assessment, or compile existing assessments, showing the extent to which water bodies and/or wetlands on the site perform the following functions: 1) water quality maintenance, 2) wildlife habitat protection, and 3) hydrologic function maintenance, including flood protection. Assign appropriate buffers (not less than 100 feet) around the development footprint throughout the site based upon the functions provided, contiguous soils and slopes, and contiguous land uses; and protect wetlands, water bodies, and their buffers from development in perpetuity by donating or selling the land or a conservation easement on the land to an accredited land trust or relevant public agency.

Additional Notes

G1 species are critically imperiled; at very high risk of extinction globally due to extreme rarity (often five or fewer populations), very steep declines, or other factors.

G2 species are imperiled; at high risk of extinction globally due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.

G3 species are vulnerable; at moderate risk of extinction due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors.

S1 species are critically imperiled in the state because of extreme rarity (often five or fewer occurrences) or because of some factor such as very steep declines making it especially vulnerable to extirpation from the state

S2 species are imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the state.

See notes under SLL Prerequisite 3: Imperiled Species and Ecological Communities" for more information about NatureServe and this classification system.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A brief description of the efforts to determine if significant habitat occurs on the project site, including information about the site received from the relevant natural heritage program or agency.
- ❑ A brief narrative summarizing the results of the efforts to determine whether significant habitat occurs on the project site.
- ❑ If significant habitat is found, submit a) a site plan which delineates significant habitat and buffers in relation to the project; and b) a letter from the accredited land trust or

relevant public agency stating that a transfer of land rights for the habitat and buffer has taken place or will take place if the project is built, such that these areas will be protected in perpetuity.

Option 2

- ❑ A site plan indicating areas that were previously developed.
- ❑ A list of plants to be used.

Option 3

- ❑ A site plan which delineates any water bodies, wetlands, and/or buffers in relation to the development footprint.
- ❑ A summary of the assessment of water body and wetland functions.
- ❑ A letter from the accredited land trust or relevant public agency stating that a transfer of land rights for the habitat and buffer has taken place or will take place if the project is built, such that these areas will be protected in perpetuity.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Smart Location & Linkage

SLL Credit 10: Restoration of Habitat or Wetlands
1 Point

Intent

Restore wildlife habitat and wetlands that have been harmed by previous human activities.

Requirements

Using only **native plants**, restore native habitat or **pre-development water bodies** or **wetlands** on the **project** site in an area equal to or greater than 10% of the **development footprint** and remove any invasive species on the site. Protect such areas from development in perpetuity by donating or selling the land or a conservation easement on the land to an accredited land trust or relevant public agency.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site plan showing areas of restoration.
- ❑ A list of plants to be used.
- ❑ A calculation comparing the size of the restored areas to the size of the development footprint.
- ❑ A letter from the accredited land trust or relevant public agency stating that a transfer of land rights for the habitat or wetlands and water bodies has taken place or will take place if the project is built, such that these areas will be protected in perpetuity.
- ❑ Declaration that any invasive species on the project were removed.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ Either a photograph, diagram, or a brief description of the restored areas.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Smart Location & Linkage

SLL Credit 11: Conservation Management of Habitat or Wetlands
1 Point

Intent

Conserve native wildlife habitat, wetlands and water bodies.

Requirements

OPTION 1 – FOR SITES WITH HABITAT

Create a long-term (at least 10-year) management plan for on-site native habitats and their buffers and create a guaranteed funding source for management. Involve at least one person from a natural resources agency, a natural resources consulting firm, or an academic ecologist in writing the management plan and conducting or evaluating the ongoing management. The plan should include biological objectives consistent with habitat conservation, and it should identify a) procedures, including personnel to carry them out, for maintaining the conservation areas; b) estimated implementation costs and funding sources; and c) threats that the **project** poses for habitat within conservation areas (e.g., introduction of exotic species, intrusion of residents in habitat areas) and measures to substantially reduce those threats;

OR

OPTION 2 – FOR SITES WITH WETLANDS AND WATER BODIES

Create a long-term (at least 10-year) management plan for any on-site **wetlands**, **water bodies** and their buffers and a guaranteed funding source for management. Involve at least one person from a natural resources agency, a natural resources consulting firm, or an academic ecologist in writing the management plan and conducting or evaluating the ongoing management. The plan should include biological objectives consistent with wetland and water body conservation, and it should identify a) procedures, including personnel to carry them out, for maintaining the conservation areas; and b) estimated implementation costs and funding sources.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A copy or summary of the management plan, including identification of preparers, or a written commitment to create a management plan if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

<u>Case 2B: Change since Stage 1</u>

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 3A: No change since Stage 2</u>

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ If a written commitment to create a management plan was submitted at previous stages, submit a copy or summary of the completed management plan.

<u>Case 3B: Change since Stage 2</u>

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Neighborhood Pattern & Design

NPD Prerequisite 1: Open Community

Required

Intent

Promote communities that are physically connected to each other. Foster community and connectedness beyond the development.

Requirements

Designate all streets and sidewalks that are built as part of the **project** or serving the project directly as available for general public use and not gated. Gated areas and enclaves are NOT considered available for public use, with the exception of education and health care campuses where gates are used for security purposes.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site and/or vicinity map indicating that all streets and sidewalks are available for general public use.

  OR

- ❑ Declaration that all streets and sidewalks are available for general public use.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1
If the project submitted at Stage 1, and project conditions remain unchanged with respect to prerequisite requirements, no additional documentation is required. Indicate “No change since Stage 1” on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Prerequisite 2: Compact Development

Required

Intent

Conserve land. Promote livability, transportation efficiency, and walkability.

Requirements

Build any residential components of the **project** at an average **density** of seven or more dwelling units per acre of **buildable land** available for residential uses;

AND

Build any non-residential components of the project at an average density of 0.50 **FAR** or greater per acre of buildable land available for non-residential uses.

If the project location is serviced by a transit agency which has specified minimum service densities that are greater than the densities required by this prerequisite, then the project must meet the transit agency's minimum service densities instead.

The specified average density must be achieved by the point in the project's construction at which 50% of dwelling units are built, or within five years of the date that the first building is occupied, whichever is longer.

Additional Notes

The density of a mixed-use building is calculated by: 1) determining the total square footage of all residential and non-residential uses; 2) calculating the percentages of the total square footage that the residential and non-residential components each represent; 3) applying those percentages to the building parcel to determine the proportionate share of land area for each component; and 4) calculating residential density as the number of dwelling units per acre using the residential share of the building parcel, and calculating non-residential density as FAR using the non-residential share of the land area divided by total non-residential square footage. For example, a mixed-use building of ten dwellings at 1,500 sq.ft. each, and 25,000 sq.ft. of retail, on one acre of land would have a residential density of 26 DU/acre and a non-residential density of 0.92 FAR. Densities of individual mixed use buildings that are not being averaged with other single-use buildings must meet either the residential density minimum or the non-residential density minimum, but need not meet both.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The *certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.*

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site plan indicating densities.

  OR

- ❑ A table of calculations of the densities of any residential components, non-residential components, and mixed use buildings.
- ❑ A statement indicating whether any transit agency has specified minimum service densities higher than densities required by this prerequisite for the area where the project is located.
- ❑ A statement indicating the expected timeline for project construction and (for projects that have a residential component) which components of the project will be completed when 50% of the dwelling units are built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to prerequisite requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

- ❑ If project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 1: Compact Development
1 to 7 Points

Intent

Conserve land. Promote community livability, transportation efficiency, and walkability.

Requirements

Design and build the **project** to achieve the densities shown in the table below.

Residential **Density** (DU/acre)	Non-residential Density (**FAR**)	Points Available
10 to 20	0.75 to 1.0	1
> 20 and ≤ 30	> 1.0 and ≤ 1.5	2
> 30 and ≤ 40	> 1.5 and ≤ 2.0	3
> 40 and ≤ 50	> 2.0 and ≤ 2.5	4
> 50 and ≤ 60	> 2.5 and ≤ 3.0	5
> 60 and ≤ 70	> 3.0 and ≤ 3.5	6
> 70	> 3.5	7

The specified density must be achieved by the point in the project's construction at which 50% of dwelling units are built, or within five years of the date that the first building is occupied, whichever is longer.

Additional Notes

The scoring of the density of a mixed-use project is calculated by a weighted average: 1) determining the total square footage of all residential and non-residential uses; 2) calculating the percentages of the total square footage that the residential and non-residential components each represent; 3) determining the density of each component as measured in dwelling units per acre and FAR respectively; 4) determining how many points the residential and non-residential component each earns separately according to the table above; 5) if the points are different, multiply the point value of the residential component by the percentage of the total square footage it represents (as determined in step 2) and multiply the point value of the non-residential component by the percentage of the total square footage it represents (as determined in step 2); 6) add the two scores together. For example; a project that is 75% residential at an average density of 65 DU/acre and 25% non-residential at an FAR of 0.8 would earn 4 points:
(.75 x 6) + (.25 x 1) = 4.25, which is rounded to 4.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The *certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.*

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site plan indicating densities.

  OR

- ❑ A table of calculations of the densities of any residential components, non-residential components, and mixed use buildings.
- ❑ For mixed-use projects, submit a calculation showing the points earned by the weighted average of residential and non-residential.
- ❑ A statement indicating the expected timeline for project construction and (for projects which have a residential component) which components of the project will be completed when 50% of the dwelling units are built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

<u>Case 2B: Change since Stage 1</u>
If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 3A: No change since Stage 2</u>
If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

<u>Case 3B: Change since Stage 2</u>
If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 2: Diversity of Uses
1 to 4 Points

Intent

Promote community livability, transportation efficiency, and walkability.

Requirements

Include a residential component in the **project** that constitutes at least 25% of the project's total building square footage; and design or locate the project such that at least 50% of the dwelling units are within ½ mile **walk distance** of at least two (1 point), four (2 points), seven (3 points) or ten (4 points) of the **diverse uses** defined in Appendix A. Uses may either be in nearby areas or be built within the development.

Verify that a pedestrian can reach the uses via routes that do not necessitate crossing any streets that have speed limits of greater than 25 miles per hour, unless those crossings have vehicle traffic controls such as signals and stop signs with crosswalks.

The specified number of uses must be in place by the time certain percentages of occupancy are in place, as indicated in the following table:

Number of uses	Percentage of project occupancy at which uses need to be in place
Two uses (1 point)	20%
Four uses (2 points)	30%
Seven uses (3 points)	40%
Ten uses (4 points)	50%

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A calculation demonstrating that at least 25% of the project's built square footage is residential.
- ❑ A site and/or vicinity map of the vicinity showing the project's dwelling units and walking routes to any of the relevant uses defined in Appendix A.
- ❑ A table of walk distances between each dwelling unit and relevant uses defined in Appendix A, and calculation of the percentage of dwelling units that lie within the specified distance.
- ❑ For any streets with speed limits greater than 25 miles per hour that intersect with walking routes to the relevant uses defined in Appendix A, verify that vehicle traffic controls exist or will be installed at all walking route intersections.
- ❑ A statement indicating the expected timeline for project construction and which uses will be in place at the time the relevant percentages of occupancy are in place.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 3: Diversity of Housing Types
1 to 3 Points

Intent

To enable citizens from a wide range of economic levels and age groups to live within a community.

Requirements

Include a sufficient variety of housing sizes and types in the **project** such that the total variety of housing within the project, or within a ¼ mile of the center of the project, achieves at least 0.5 according to the following calculation, which is based on the Simpson Diversity Index using the housing categories below.

The Simpson Diversity Index score is calculated with the following equation:

Score = $1 - \sum (n/N)^2$,

where n = the total number of dwellings in a single category, and
N = the total number of dwellings in all categories.

Score on the Simpson Diversity Index	Points Earned
≥ 0.5 and < 0.6	1
≥ 0.6 and < 0.7	2
≥ 0.7	3

Housing categories are defined for the purposes of this calculation in LEED for Neighborhood Development as:

(1) Detached residential large - (greater than 1200 sq. ft.)
(2) Detached residential small - (less than 1200 sq. ft.)
(3) Duplex or townhouse - large (greater than 1200 sq. ft.)
(4) Duplex or townhouse - small (less than 1200 sq. ft.)
(5) Multifamily dwelling in a building with no elevator - large (greater than 750 sq. ft.)
(6) Multifamily dwelling in a building with no elevator - small (less than 750 sq. ft.)
(7) Multifamily dwelling in a building with elevator four stories or fewer - large (greater than 750 sq. ft.)
(8) Multifamily dwelling in a building with elevator four stories or fewer - small (less than 750 sq. ft.)
(9) Multifamily dwelling in a building with elevator more than four stories and fewer than nine stories - large (greater than 750 sq. ft.)
(10) Multifamily dwelling in a building with more than four stories and fewer than nine stories - small (less than 750 sq. ft.)
(11) Multifamily dwelling in a building with elevator nine stories or more - large (greater than 750 sq. ft.)
(12) Multifamily dwelling in a building with nine stories or more - small (less than 750 sq. ft.)

(13) Live/work large (greater than 1200 sq. ft.)
(14) Live/work small (less than 1200 sq. ft.)
(15) Accessory Unit – large (greater than 1200 sq. ft.)
(16) Accessory Unit – small (less than 1200 sq. ft.)

Townhouse and live/work units may be ground related and/or within a multifamily or mixed-use building. Double counting is prohibited. Each dwelling may be classified in only one category.

Additional Notes

This credit was adapted from Laurance Aurbach's TND Design Rating Standards Version 2.1, June 2005.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site and/or vicinity map showing the location of different types of housing, either 1) within the project; or 2) within ¼ mile of the center of the project.
- ❑ The number of dwelling units in each category, the total number of dwelling units, and the results of the Simpson Diversity Index calculation.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

<u>Case 2B: Change since Stage 1</u>
If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 4: Affordable Rental Housing
1 to 2 Points

Intent

To enable citizens from a wide range of economic levels and age groups to live within a community.

Requirements

Include a proportion of rental units priced for households earning below **area median income** such that:

OPTION 1

At least 15% of total rental units are priced for households up to 50% of area median income and units are maintained at affordable levels for a minimum of fifteen years (1 point);

OR

OPTION 2

At least 30% of total rental units are priced for households up to 80% of area median income and units are maintained at affordable levels for a minimum of fifteen years (1 point);

OR

OPTION 3

At least 15% of total rental units are priced for households up to 50% of area median income and an additional 15% of total rental units are priced for households at up to 80% of area median income and units are maintained at affordable levels for a minimum of fifteen years (2 points).

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ Confirmation of current HUD data regarding the area median income and the resulting maximum monthly rents.
- ❑ A table showing the number of affordable and market rate housing units, the rental prices of any affordable units, and a calculation of the percentage of rental units that are priced within the specified range.
- ❑ A copy of, or a written commitment to create a regulatory and operating agreement, deed restrictions, or other recorded document evidencing that the units will be maintained at the specified affordable levels for a minimum of fifteen years.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 5: Affordable For-Sale Housing
1 to 2 Points

Intent

To enable citizens from a wide range of economic levels and age groups to live within a community.

Requirements

Include a proportion of for-sale housing affordable to households at or slightly above the **area median income** such that:

OPTION 1

At least 10% of for-sale housing is priced for households up to 80% of the area median income (1 point);

OR

OPTION 2

At least 20% of for-sale housing is priced for households up to 120% of the area median income (1 point);

OR

OPTION 3

At least 10% of for-sale housing is priced for households up to 80% of the area median income and an additional 10% of for-sale housing is priced for households at up to 120% of the area median income (2 points).

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ Confirmation of current HUD data regarding the area median income and the resulting maximum housing sale price(s).
- ❑ A table showing the number of affordable and market rate housing units, the sale prices of any affordable units, and a calculation of the percentage of for-sale units that are priced within the specified range.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 6: Reduced Parking Footprint
2 Points

Intent

Design parking to increase the pedestrian orientation of projects and to minimize the adverse environmental effects of parking facilities.

Requirements

For any non-residential buildings and multifamily residential buildings that are part of the project, locate all off-street surface parking lots at the side or rear of buildings, leaving building frontages and streetscapes free of surface parking lots;

AND

Use no more than 20% of the total **development footprint** area for surface parking facilities, with no individual surface parking lot larger than 2 acres. For the purposes of this credit, surface parking facilities include ground-level garages unless they are under or over space intended for human occupancy. Underground or multi-story parking facilities can be used to provide additional capacity, and on-street parking spaces are exempt from this limitation;

AND

For any non-residential buildings and multifamily residential buildings that are part of the **project**, provide bicycle and/or carpool parking spaces equivalent to 10% of the total automobile parking for each non-residential and multifamily building on the site. Signage indicating carpool parking spots should be provided, and bicycle parking should be within 200 yards of the entrance to the building that it services. The 10% carpool/bicycle space requirement can be met with any combination of bicycle and carpool parking.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site plan indicating the location of all surface, underground, or multi-story parking facilities, including relevant carpool and bicycle spaces and carpool signage. For bicycle spaces provided for non-residential buildings, indicate the distance between the spaces and the entrance of the building they serve.
- ❑ The percentage of total development footprint that is used for surface parking facilities.
- ❑ The size of each individual parking lot that is part of the project.
- ❑ For any non-residential or multifamily residential buildings, submit the number of conventional automobile parking spaces, carpool spaces, and bicycle parking spaces that will be provided.
- ❑ Confirm that signage will be provided for any carpool spaces.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 7: Walkable Streets
4 to 8 Points

Intent

Provide appealing and comfortable pedestrian street environments in order to promote pedestrian activity. Promote public health though increased physical activity.

Requirements

Design and build the **project** such that all of the following are achieved (4 points):

a. A principal **functional entry** of each building has a front façade that faces a public space such as a street, square, park, paseo, or plaza.
b. A minimum of 30% of all street frontages located *within* the project, if any, are planned for development that complies with the minimum building-height-to-street-width proportions of 1:3; and where building sites are planned along streets *bordering* the project, a minimum of 15% of the total street frontage of such sites contains (or is dedicated to) development that will produce a building-height-to-street-width proportion of 1:3. Street frontages are to be measured in linear feet.
c. Continuous sidewalks or equivalent provisions for walking are provided along both sides of all streets within the **project**. New sidewalks must be at least 4 feet wide. Equivalent provisions for walking include ***woonerfs*** and footpaths.
d. All streets along exclusively residential blocks within the **project**, whether new or existing, are designed for a maximum speed of 20 mph.
e. All streets along non-residential or mixed use blocks within the project, whether new or existing, are designed for a maximum speed of 25 mph.

If the above measures are achieved, the project may earn additional points as follows: 1 point for designing and building the project such that any three measures on the list below are accomplished (up to 4 additional points):

f. The front façades of at least 80% of all buildings are no more than 25 feet from front property line.
g. The front facades of at least 50% of all buildings are no more than 18 feet from the front property line.
h. The front facades of at least 50% of mixed-use and non-residential buildings are contiguous to the sidewalk.
i. Functional building entries occur every 75 feet, on average, along non-residential or mixed use blocks.
j. All ground-level non-residential interior spaces that face a public space have transparent glass on at least 33% of the ground-level façade.
k. No blank (without doors or windows) walls longer than 50 feet occur along sidewalks. Walls with public art installations such as murals may be exempted.
l. Any ground-level storefront windows must be kept open and visible (unshuttered) at night, and this must be stipulated to future owners in **CC&Rs** or other binding documents.

m. On-street parking is provided on 70% of both sides of all new streets. The percentage of on-street parking shall be measured by comparing the length of street designated for parking to the total length of the curb around the perimeter of each block, including curb cuts, driveways, and intersection radii.
n. Street trees occur between the vehicle travel way and sidewalk at intervals of no greater than 40 feet;
o. At least 50% of ground-floor dwelling units have an elevated finished floor no less than 24 inches above the sidewalk grade.
p. In non-residential or mixed use projects, 50% or more of the total number of office buildings include ground floor retail; and all businesses and/or other community services on the ground floor are accessible directly from sidewalks along a public space such as a street, square, or plaza.
q. Trees or other structures provide shade within five years of project occupancy over at least half the length of sidewalks included within or contiguous to the project. The estimated crown diameter (the width of the shade if the sun is directly above the tree) is used to calculate the shaded area.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ To achieve the base 4 points, submit a site plan or plans indicating the following:
  - (a) the principal functional entries of all buildings and any streets or other public spaces.
  - (b) any street frontages planned for development with a minimum building height- to-street-width proportion of 1:3.
  - (c) the location and width of sidewalks or equivalent provisions for walking.
  - (d/e) the location of residential and non-residential uses, and the speed for which each street within the project will be designed.
- ❑ To achieve the base 4 points, submit the following additional documentation:
  - (b) a calculation showing the percentage of street frontage within the project that will meet the minimum building height-to-street-width proportion of 1:3; and the same percentage for street frontage on the borders of the project.
- ❑ To achieve additional points, submit a site plan or plans indicating the following (as appropriate to the measures attempted):

(f/g) the distance between the front façades of buildings and the front property lines.

(h) the location of any mixed-use or non-residential buildings and the distance between their front façades and the sidewalk.

(i) the location of functional entries along non-residential or mixed use blocks.

(j) the location of all ground-level non-residential uses along public spaces, the length of the use that will border the public space (in linear feet), and which of them will have transparent glass on the ground-level façade.

(k) the location and length of any blank walls along sidewalks.

(l) the location of any ground-level storefront windows that will be kept open and visible (unshuttered) at night.

(m) the location and length of any on-street parking.

(n) the location of any street trees and the distance between them.

(o) the location of any ground-floor dwelling units, and which of them will have an elevated finished floor.

(p) the location of any office buildings, which of them will have ground floor retail, and the location of entries to any ground-level business or community service from sidewalks or other public spaces.

(q) the location and length of sidewalks, and the location and length of shade that will be generated by trees or other structures.

- ❑ To achieve additional points, submit the following additional documentation (as appropriate to the measures attempted):

(f) a calculation showing the percentage of building front façades that will be no more than 25 feet from the front property line.

(g) a calculation showing the percentage of building front façades that will be no more than 18 feet from the front property line.

(h) a calculation showing the percentage of mixed-use and non-residential building front façades that will be contiguous to the sidewalk.

(i) a calculation showing the average of the distances between functional building entries along non-residential or mixed-use blocks.

(j) a calculation showing the percentage of ground-level non-residential interior spaces that will face a public space that will have transparent glass on the ground-level façade.

(l) a copy of, or a written commitment to create, any necessary CC&Rs, development agreements, or other binding documents that will ensure that ground-level storefront windows are kept open and visible (unshuttered) at night.

(m) a calculation showing the percentage of street length that will have on-street parking.

(o) a calculation showing the percentage of ground-floor dwelling units that will have an elevated finished floor.

(p) a calculation showing the percentage of office buildings that will have ground floor retail.

(q) a calculation showing the percentage of sidewalks that will be shaded.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ For projects attempting the measure described in (l), if a written commitment to create the required agreements was submitted previously, submit a copy of the actual agreement(s).

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Neighborhood Pattern & Design

NPD Credit 8: Street Network

1 to 2 Points

Intent

Encourage the design of projects that incorporate high levels of internal connectivity and the location of projects in existing communities in order to conserve land, promote multimodal transportation and promote public health through increased physical activity.

Requirements

If new cul-de-sacs are created as part of the **project**, include a pedestrian or bicycle through-connection in at least 50% of any new cul-de-sacs. If topographical conditions prohibit such connections, these are not included in the calculation.

AND meet the requirements under one of the following Options:

OPTION 1 – FOR PROJECTS SMALLER THAN 7 ACRES

Locate the project such that the **street grid density** within a ¼ mile radius from the center of the project falls within one of the ranges listed in the table below, OR design the project such that the project's street grid density falls within one of the ranges listed in the table below.

OR

OPTION 2 – FOR PROJECTS 7 ACRES OR LARGER

Design the project such that the project's average street grid density falls within one of the ranges listed in the table below.

Street grid density (centerline miles/sq.mi.)	Points Earned
20 – 29	1
>30	2

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

All Options

- ❑ A site plan indicating the location of any cul-de-sacs and pedestrian or bicycle through-connections.

Option 1

- ❑ A site plan and map of the vicinity showing the street grid density of the area within a ¼ mile radius of the center of the project site.
- ❑ A calculation of the street grid density within a ¼ mile radius of the center of the project site.

Option 2

- ❑ A site plan showing the street grid density of the project site.
- ❑ A calculation of the street grid density of the project site.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

<u>Case 2B: Change since Stage 1</u>

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 3A: No change since Stage 2</u>

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

<u>Case 3B: Change since Stage 2</u>

If project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 9: Transit Facilities

1 Point

Intent

Encourage transit use and reduce driving by creating safe and comfortable transit facilities.

Requirements

Provide covered and at least partially enclosed shelters, adequate to buffer wind and rain, with at least one bench at each transit stop within the **project boundaries**. Shelters shall be illuminated to five average maintained footcandles (light levels may be reduced after hours). Existing external lighting can contribute to this level, but any new lighting shall meet light pollution requirements in GCT Credit 20, and designed to not directly illuminate any windows of residential properties.

AND

Provide kiosks, bulletin boards, and/or signs devoted to providing local transit information as part of the project, including basic schedule and route information at each transit stop that borders or falls within the **project**.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site plan showing the location of any transit stops within the project boundaries and any kiosks, bulletin boards, or signs with local transit information that will be provided as part of the project.
- ❑ A brief narrative listing the facilities for each transit stop that will be provided, including shelters, benches, and the mechanism for achieving the minimum light levels.
- ❑ A brief narrative describing the transit information that will be posted at kiosks, bulletin boards, or signs.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 10: Transportation Demand Management
2 Points

Intent

Reduce energy consumption and pollution from motor vehicles by encouraging use of public transit.

Requirements

OPTION 1

Create and implement a comprehensive transportation demand management (TDM) program for the **project** aimed at reducing **weekday peak period** trips by at least 20% compared to the forecasted trip generation for the project without the TDM strategies; and fund for a minimum of two years following **buildout** of the project (1 point);

OR

OPTION 2

Provide transit passes valid for at least one year, subsidized to be half of regular price or cheaper, to each resident and employee locating within the project during the first three years of project occupancy (or longer). Publicize the fact that subsidized transit passes are available to the eligible residents and employees (1 point);

OR

OPTION 3

Provide transit service (with vans, shuttles, buses) to rail, ferry, or other major transit facilities and/or another major destination such as a retail or employment center, with service no less frequent than five rides per weekday peak period. The service must begin when the project is 20% occupied or sooner, and must be guaranteed for at least two years beyond project buildout (1 point).

No more than 2 points can be earned under this credit.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A narrative describing the TDM program, including the strategies used, the estimated resulting trip reduction percentage, and the estimated cost of the program for two years following buildout of the project.
- ❑ A written commitment to fund the TDM program for two years following buildout of the project if the project is built.

Option 2

- ❑ A narrative describing the type of transit available, the mechanism for publicizing and distributing subsidized transit passes, the regular and subsidized prices of passes, and the estimated number of new residents and employees that will receive subsidized transit passes.
- ❑ A written commitment to provide a legally binding guarantee that passes will be provided to meet the requirements, if the project is built.

Option 3

- ❑ A map of the vicinity indicating the routes of new transit service that will be provided as part of the project.
- ❑ A description of the type of transit, and a schedule of service to be provided by as part of the project.
- ❑ A timeline of estimated project occupancy as compared with the estimated start date of transit service provided as part of the project.
- ❑ A written commitment to provide a legally binding guarantee that such service will be provided for at least two years beyond project buildout, if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

<u>Case 2B: Change since Stage 1</u>
If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

❑ Submit updated versions of the relevant documentation required at Stage 1.

<u>Case 2C: Did not submit at Stage 1</u>
❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ For Options 2 or 3, if a copy of the legally binding guarantee has not yet been submitted, submit a copy of this guarantee.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Neighborhood Pattern & Design

NPD Credit 11: Access to Surrounding Vicinity
1 Point

Intent

Provide direct and safe connections, for pedestrians and bicyclists as well as drivers, to local destinations and neighborhood centers. Promote public health by facilitating walking and bicycling.

Requirements

Design and build **projects** such that there is at least one through-street at the **project boundary** every 800 feet, or at existing abutting street intervals, whichever distance is smaller. This does not apply to connections that cannot physically be made; e.g. **wetlands**, rivers, railroads, extreme topography, natural gas lines, pipeline easements, highways, expressways and other limited-access roads.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site and/or vicinity map showing the project boundary, existing abutting street intervals, the through-streets at the project boundary, and the distances between through-streets.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 12: Access to Public Spaces
1 Point

Intent

To provide a variety of open spaces close to work and home to encourage walking, physical activity and time spent outdoors.

Requirements

Locate and/or design **project** so that a park, green plaza or square at least 1/6 acre in area, and at least 150' in width, lies within 1/6 mile **walk distance** of the 90% of the dwelling units and business entrances in the project. Parks less than 1 acre must also have a proportion no narrower than 1 unit of width to 4 units of length;

AND

For projects larger than 7 acres only, locate and/or design the project so that taken together all of the parks in the project shall average at least 1/2 acre in size.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site and/or vicinity map showing 1) the location of all residential units and non-residential building entrances; 2) the location, size, and proportions of all relevant parks; and 3) the walking routes between the project's buildings and relevant parks.
- ❑ A table of walk distances between each dwelling unit or non-residential building entrance and the closest relevant public space, and a calculation of the percentage of dwelling units and non-residential building entrances that lie within the specified distance.
- ❑ For projects larger than 7 acres, submit a calculation of the average size of parks (in acres) in the project.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 13: Access to Active Spaces
1 Point

Intent

To provide a variety of open spaces close to work and home to encourage walking, physical activity and time spent outdoors.

Requirements

OPTION 1

Locate and/or design the **project** so that an active open space facility (e.g., general playfields, soccer, baseball, basketball and other sports fields) of at least 1 acre lies within ½ mile **walk distance** of 90% of the dwelling units and business entrances in the project;

OR

OPTION 2

Locate and/or design the project so that at least 50% of dwelling units and business entrances are located within ¼ mile walk distance of a multi-use trail or Class I bikeway of at least 3 miles in length;

OR

OPTION 3

Locate and/or design the project so that at least 90% of all dwelling units and business entrances in the project are located within ¼ mile walk distance of a public recreation center or gym with outdoor facilities or a park with active recreational facilities.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A site and/or vicinity map showing 1) the location of all residential units and non-residential building entrances; 2) the location and size of all relevant active open space facilities; and 3) the walking routes between the project's buildings and relevant facilities.
- ❑ A table of walk distances between each dwelling unit or non-residential building entrance and the closest relevant active open space facility, and a calculation of the percentage of dwelling units and non-residential building entrances that lie within the specified distance.

Option 2

- ❑ A site and/or vicinity map showing 1) the location of all buildings; 2) the location and length of the relevant trail; and 3) the walking routes between the project's buildings and relevant trail.
- ❑ A table of walk distances between each building and the closest relevant trail, and a calculation of the percentage of building that lie within the specified distance.

Option 3

- ❑ A site and/or vicinity map showing 1) the location of all residential units and non-residential building entrances; 2) the location of all relevant recreation centers and gyms with outdoor facilities, and parks with active recreational facilities; and 3) the walking routes between the project's buildings and relevant recreation centers, gyms, and parks.
- ❑ A table of walk distances between each dwelling unit or non-residential building entrance and the closest relevant recreation center, gym, or park, and a calculation of the percentage of dwelling units and non-residential building entrances that lie within the specified distance.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Neighborhood Pattern & Design

NPD Credit 14: Universal Accessibility
1 Point

Intent

Enable the widest spectrum of people, regardless of age or ability, to more easily participate in their community life by increasing the proportion of areas that are usable by people of diverse abilities.

Requirements

For **projects** with residential components:

For each residential unit type developed, design 20% (and not less than one) of each type to comply with the accessible design provisions of the Fair Housing Amendments Act (FHAA) and Section 504 of the Rehabilitation Act (Rehabilitation Act), as applicable. Separate residential unit types include: single-family, duplex, triplex, multi-unit row or townhouses, and mixed-use buildings that include residential units. (Compliance for multi-family buildings of four or more units is already a regulatory requirement.). All paths of travel between residential units and other buildings within the project shall comply with the accessible design provisions of the FHAA and Rehabilitation Act, as applicable;

AND

For projects with common-use or recreational facilities constructed as part of the project:
- For any residential areas, apply the accessible design provisions of the FHAA and the Rehabilitation Act to facilities and rights-of-way; and
- For any non-residential areas, apply the accessible design provisions of the American Disabilities Act (ADA) to facilities and rights-of-way.

Projects that include only non-residential components and public right-of-ways will not be able to achieve this credit, since they are already required by law to comply with applicable accessibility regulations. However, if non-residential projects include any common-use or recreational facilities not covered by accessibility regulations, they will be able to achieve the credit.

Regarding residential accessibility design provisions, an accessible entrance can be located at the front, side or back of the residential unit, which may sometimes be determined by the topography of the site.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A brief narrative identifying the universal design or universal accessibility features of the project, and identifying any applicable provisions of the FHAA, Rehabilitation Act, and the ADA.
- ❑ For projects with residential components, submit a site plan indicating the location of any units and paths of travel that comply with the applicable provisions of the FHAA and the Rehabilitation Act, and a calculation showing the percentage of each type of residential unit that complies with the applicable provisions.
- ❑ For projects with common-use or recreational facilities constructed as part of the project, submit a site plan indicating the location of these facilities, including rights-of-way in residential areas.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

<u>Case 2B: Change since Stage 1</u>

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 3A: No change since Stage 2</u>

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ For projects with residential components, submit a list of street addresses for any residential units that comply with the applicable provisions of the FHAA and the Rehabilitation Act

<u>Case 3B: Change since Stage 2</u>

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Neighborhood Pattern & Design

NPD Credit 15: Community Outreach and Involvement
1 Point

Intent

To encourage community participation in the project design and planning and involve the people who live in a community in deciding how it should be improved or how it should change over time.

Requirements

Meet with immediate neighbors and local public officials to solicit input on the proposed **project** during the pre-conceptual design phase,

AND

Host an open community meeting during conceptual design phase to solicit input on the proposed project,

AND

Modify the project design as a direct result of community input, or if modifications are not made, explain why community input did not generate design improvements,

AND

Work directly with community associations and/or other social networks of the community to advertise public meetings and generate comments on project design,

AND

Establish ongoing means for communication between the developer and the community throughout the design, construction, and in cases where the developer maintains control of part or the entire project, post-construction.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ For projects that have not yet undertaken community outreach and involvement but intend to, submit a written commitment to meet the requirements of the credit and a brief description as to how and when the activities are expected to take place.
- ❑ For projects that have already undertaken community outreach and involvement, submit the following:

  1) some documentation that at least one public meeting was held (examples could include meeting fliers, agenda, minutes, invitation letters, photographs of the meeting, copies of meeting sign-in sheets);

  2) a brief narrative and/or illustration demonstrating how community input influenced changes to the design or an explanation of why changes were not made;

  3) at least one letter of support from a community association and/or social network stating that the project team worked directly to engage with the association or network to advertise and generate comments on the project;

  4) a brief narrative describing the ongoing means of communication between developers and community during design, construction, and in cases where the developer maintains control of part or the entire project, after construction.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ If community outreach and involvement efforts had not taken place at the time of previous stages of certification, submit documentation of these efforts.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Neighborhood Pattern & Design

NPD Credit 16: Local Food Production
1 Point

Intent

Promote community-based and local food production to minimize the environmental impacts from transporting food long distances and increase direct access to fresh foods.

Requirements

Establish **CC&Rs** or other forms of deed restrictions that do not prohibit areas for growing produce, including greenhouses, on any portion or area of residential front yards, rear yards, side yards, balconies, patios or rooftops. Greenhouses, but not gardens, may be prohibited in front yard areas that face the street.

AND

Meet the requirements under one of the following Options:

OPTION 1 – NEIGHBORHOOD FARMS AND GARDENS

Dedicate permanent and viable growing space and/or related facilities (such as greenhouses) within the **project** at the square footage areas specified below. Provide fencing, watering systems, soil and/or garden bed enhancements (such as raised beds), secure storage space for garden tools, solar access, and pedestrian access for these spaces. Ensure that the spaces are owned and managed by an entity that can include occupants of the project in its decision-making, such as a community group, a homeowners association, or a public body.

Project **density** (dwelling unit/acre)	Required growing space (sq ft per dwelling unit)
7 to 14	200
> 14 and ≤ 22	100
> 22 and ≤ 28	80
> 28 and ≤ 35	70
> 35	60

OR

OPTION 2 – COMMUNITY SUPPORTED AGRICULTURE

Purchase shares in a **Community Supported Agriculture (CSA)** program located within 150 miles of the project site for at least 80% of the households within the project for two years. Shares must be delivered to within ¼ mile of the project on a regular schedule, which shall not be less than twice per month at least four months of the year.

OR

OPTION 3 – PROXIMITY TO FARMERS' MARKET

Locate and/or design project such that the center is within ¼ mile of an established farmer's market (that has been operating for at least two years), with at least three producer vendors, and that operates at least once a week for at least 5 months of the year.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

All Options

- ❑ A copy of, or a written commitment to create, any necessary CC&Rs, development agreements, deed restrictions, or other binding documents that will establish that areas for growing produce are not prohibited as specified.

Option 1

- ❑ A site plan showing the location and size of dedicated space for growing and/or related facilities.
- ❑ A calculation showing the required growing space based on density.
- ❑ A written commitment to provide the items specified if the project is built.
- ❑ A brief narrative explaining what entity will serve to own and manage the growing spaces and facilities.

Option 2

- ❑ Identification of available CSA programs that can deliver to within ¼ mile of the project site according to the specified schedule, and an estimated cost for purchasing shares for 80% of the project's households for two years.
- ❑ A written commitment to purchase shares for 80% of the project's households for two years, if the project is built.

Option 3

- ❑ A map showing the location of the relevant farmers' market in relation to the project.

- ❑ A brief narrative describing the number of producer vendors and the market's schedule of operation.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ If a written commitment to create the required agreements regarding the allowance of growing spaces and facilities was submitted previously, submit a copy of the actual agreement(s).
- ❑ For Option 1, if a written commitment to provide the items specified was submitted previously, submit confirmation that the items were provided.
- ❑ For Option 2, if a written commitment to purchase shares for 80% of the project's households for two years, submit confirmation that the shares were purchased.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Prerequisite 1: Construction Activity Pollution Prevention Required

Intent

Reduce pollution from construction activities by controlling soil erosion, waterway sedimentation and airborne dust generation.

Requirements

Create and implement an Erosion and Sedimentation Control (ESC) Plan for all construction activities associated with the **project**. The ESC Plan shall list the Best Management Practices (BMPs) employed and describe how the BMPs accomplish the following objectives:

- Prevent loss of soil during construction by stormwater runoff and/or wind erosion, including protecting topsoil by stockpiling for reuse.
- Prevent sedimentation of any impacted stormwater conveyance systems or receiving streams.
- Prevent polluting the air with dust and particulate matter.

The BMPs shall be selected from the 2003 EPA Construction General Permit (CGP) OR local erosion and sedimentation control standards and codes, whichever is more stringent.

Note: Many projects are already mandated to comply with the CGP. These requirements are intended to integrate consideration of these measures into site planning and to ensure that all projects seeking LEED certification implement these measures, regardless of size.

Additional Notes

Information on the CGP is available at: http://cfpub.epa.gov/npdes/stormwater/cgp.cfm.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site plan indicating where erosion and sedimentation control will be necessary during construction.
- ❑ A written commitment that an ESC plan will be created and implemented if the project is built, or confirmation that local code requires the same provisions.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ A summary of the ESC Plan, including a list of BMPs that will be used and confirmation of whether they were selected from the EPA CGP or local standards and codes.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to prerequisite requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ Copies of photographs or drawings to document the erosion and sedimentation control measures implemented on the site, or a representative sample thereof.
- ❑ A brief narrative describing the erosion and sedimentation control measures implemented on the project.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 1: LEED Certified Green Buildings

1 to 3 Points

Intent

Encourage the design and construction of buildings to utilize green building practices.

Requirements

OPTION 1 – FOR **PROJECTS** WITH 5 OR FEWER **HABITABLE BUILDINGS**

Design, construct, or retrofit one building as part of the project to be certified under one of the following LEED building rating systems: LEED for New Construction, LEED for Existing Buildings, LEED for Homes, LEED for Core & Shell, LEED for Schools, or any Application Guides of these rating systems (1 point). Additional points (no more than 3 total) may be earned for each additional certified building that is part of the project;

OR

OPTION 2 – FOR PROJECTS WITH 6 OR MORE HABITABLE BUILDINGS

Design, construct, or retrofit a percentage of the square footage of buildings that are part of the project to be certified under one of the LEED building rating programs listed above. Points are available as follows:

Percent of square footage of project's buildings LEED certified	Points
20% to 30%	1
> 30% to 40%	2
> 40%	3

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to certify the relevant buildings under a LEED building rating system if the project is built.

Option 2

- ❑ A calculation showing the percentage of square footage that will be LEED certified.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ Confirmation that the relevant buildings have been registered under a LEED building rating system. (If buildings are submitting for Design Review, the results of this review may be submitted, but are not required.)

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ Confirmation that the relevant buildings have been certified under a LEED building rating system.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 2: Energy Efficiency in Buildings
1 to 3 Points

Intent

Encourage the design and construction of energy efficient buildings to reduce air, water, and land pollution and environmental impacts from energy production and consumption.

Requirements

1 POINT CAN BE EARNED AS FOLLOWS:

Design and construct at least 90% of all buildings in the **project** such that they meet one of the following requirements according to the appropriate category:

Category 1: For non-residential buildings and residential buildings over 3 stories:

WHOLE BUILDING ENERGY SIMULATION

Demonstrate a minimum 10% improvement in the proposed building performance rating compared to the baseline building performance rating per ASHRAE/ IESNA Standard 90.1-2004 (without addenda) by a whole building project simulation using the Building performance Rating Method in Appendix G of the Standard. Appendix G requires that this energy analysis include ALL of the energy costs within and associated with the building project. To achieve this point, the proposed design:

- must comply with the mandatory provisions (Sections 5.4, 6.4, 7.4, 8.4, 9.4 and 10.4) in Standard 90.1-2004 (without addenda);
- must include all the energy costs within and associated with the building project; and
- must be compared against a baseline building that complies with Appendix G to Standard 90.1-2004 (without addenda). The default process energy cost is 25% of the total energy cost for the baseline building. For buildings where the process energy cost is less than 25% of the baseline building energy cost, the LEED submittal must include supporting documentation substantiating that process energy inputs are appropriate.

For the purposes of this analysis, process energy is considered to include, but is not limited to, office and general miscellaneous equipment, computers, elevators and escalators, kitchen cooking and refrigeration, laundry washing and drying, lighting exempt from the lighting power allowance (e.g. lighting integral to medical equipment) and other (e.g. waterfall pumps). Regulated (non-process) energy includes lighting (such as for the interior, parking garage, surface parking, façade, or building grounds, except as noted above), HVAC (such as for space heating, space cooling, fans, pumps, toilet exhaust, parking garage ventilation, kitchen hood exhaust, etc.), and service water heating for domestic or space heating purposes.

For this credit, process loads shall be identical for both the baseline building performance rating and for the proposed building performance rating. However, project teams may follow the Exceptional Calculation Method (ASHRAE 90.1-2004 G2.5) to document measures that reduce process loads. Documentation of process load energy savings shall include a list of the assumptions made for both the base and proposed design, and theoretical or empirical information supporting these assumptions.

OR

PRESCRIPTIVE COMPLIANCE PATH A

Comply with the prescriptive measures of the ASHRAE Advanced Energy Design Guide for Small Office Buildings or the ASHRAE Advanced Energy Design Guide for Small Retail Buildings, as appropriate to building type. The following restrictions apply:

- Buildings must be under 20,000 square feet.
- Buildings must be office or retail occupancy.
- Project teams must fully comply with all applicable criteria as established in the Advanced Energy Design Guide for the climate zone in which the building is located.

OR

PRESCRIPTIVE COMPLIANCE PATH B

Comply with the Basic Criteria and Prescriptive Measures of the Advanced Buildings Benchmark™ Version 1.1 with the exception of the following sections: 1.7 Monitoring and Trend-logging, 1.11 Indoor Air Quality, and 1.14 networked Computer Monitor Control. The following restrictions apply:

- Project teams must fully comply with all applicable criteria as established in Advanced Buildings Benchmark for the climate zone in which the building is located.

Category 2: For residential buildings 3 stories or fewer:

Qualify as an ENERGY STAR Home by either a performance path (through a **HERS Index** rating) or a prescriptive path (Builder Option Package or BOP).

2 POINTS CAN BE EARNED AS FOLLOWS:

Design and construct at least 90% of all buildings in the project such that they meet one of the following requirements according to the appropriate category:

Category 1: For non-residential buildings and residential buildings over 3 stories:

WHOLE BUILDING ENERGY SIMULATION

Demonstrate a minimum 15% improvement in the proposed building performance rating compared to the baseline described above in WHOLE BUILDING ENERGY SIMULATION of Category 1.

OR

PRESCRIPTIVE COMPLIANCE PATH A

Comply with the prescriptive measures of the ASHRAE Advanced Energy Design Guide for Small Office Buildings or the ASHRAE Advanced Energy Design Guide for Small Retail Buildings, as described above in PRESCRIPTIVE COMPLIANCE PATH A of Category 1.

Category 2: For residential buildings 3 stories or fewer:

Qualify as an ENERGY STAR Home by either a performance path (through a HERS Index rating) or a prescriptive path (Builder Option Package or BOP).

3 POINTS CAN BE EARNED AS FOLLOWS:

Design and construct at least 90% of all buildings in the project such that they meet one of the following requirements according to the appropriate category:

Category 1: For non-residential buildings and residential buildings over 3 stories:

WHOLE BUILDING ENERGY SIMULATION

Demonstrate a minimum 20% improvement in the proposed building performance rating compared to the baseline described above in WHOLE BUILDING ENERGY SIMULATION of Category 1.

OR

PRESCRIPTIVE COMPLIANCE PATH A

Comply with the prescriptive measures of the ASHRAE Advanced Energy Design Guide for Small Office Buildings or the ASHRAE Advanced Energy Design Guide for Small Retail Buildings, as described above in PRESCRIPTIVE COMPLIANCE PATH A of Category 1.

Category 2: For residential buildings 3 stories or fewer:

Exceed the ENERGY STAR for Homes requirements by achieving a minimum **HERS Index** of at least 80 for **IECC** Climate Zones 1-5 (generally the southern United States), or at least 75 for IECC Climate Zones 6-8 (generally the northern United States).

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to meet the requirements of the credit as appropriate to the number of points attempted if the project is built, including a table listing each building and what compliance path is planned for the building, and a calculation showing the percentage of buildings that will be meeting the relevant requirements.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ For Category 1 buildings, submit a statement of the project team's capacity and/or qualifications to design and construct the relevant buildings according to the compliance path chosen, and/or a description of the services that will be contracted to do so.
- ❑ For Category 2 buildings, submit the name of the HERS provider to be used or a brief narrative explaining how the project team will ensure that homebuilders will have the necessary capacity and/or qualifications to meet the requirements.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ For Category 1 buildings using WHOLE BUILDING ENERGY SIMULATION, submit confirmation that, for a representative sample of buildings, whole building energy simulation was completed and the specified percentage of improvement in energy performance was achieved. (The LEED submittal template may provide additional calculations that are too lengthy to repeat here.)

- ❑ For Category 1 buildings using PRESCRIPTIVE COMPLIANCE PATH A, submit confirmation that, for a representative sample of buildings, the prescriptive measures of the appropriate ASHRAE Advanced Energy Design Guide were met. (The LEED submittal template may provide additional calculations that are too lengthy to repeat here.)
- ❑ For Category 1 buildings using PRESCRIPTIVE COMPLIANCE PATH B, submit confirmation that, for a representative sample of buildings, the prescriptive measures of the Advanced Buildings Benchmark™ were met. (The LEED submittal template may provide additional calculations that are too lengthy to repeat here.)
- ❑ For Category 2 buildings attempting 1 or 2 points, submit the ENERGY STAR for Homes certificate.
- ❑ For Category 2 buildings attempting 3 points, submit the HERS performance test results.

<u>Case 3B: Change since Stage 2</u>
If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 3: Reduced Water Use
1 to 3 Points

Intent

Minimize water use in buildings and for landscape irrigation to reduce the impact to natural water resources and reduce the burden on municipal water supply and wastewater systems.

Requirements

OPTION 1 – INDOOR (1 to 2 points)

Design and construct at least 90% of all buildings in the **project** such that they meet one of the following requirements according to the appropriate category (1 point):

Category 1: For non-residential buildings and residential buildings over 3 stories:

Employ strategies that in aggregate use 20% less water than the water use baseline calculated for the building (not including irrigation) after meeting the Energy Policy Act of 1992 fixture performance requirements. Calculations are based on estimated occupant usage and shall include only the following fixtures (as applicable to the building): water closets, urinals, lavatory faucets, showers, and kitchen faucets.

Category 2: For residential buildings 3 stories or fewer:

Comply with 2 out of 3 of the following requirements:

- The average flow rate for all lavatory faucets must be ≤ 2.0 GPM.
- The average flow rate for all shower heads must be ≤ 2.0 GPM.
- The average flow rate for all toilets, including dual-flush toilets, must be ≤ 1.3 GPF.

2 POINTS CAN BE EARNED AS FOLLOWS:

Design and construct at least 90% of all buildings in the project such that they meet one of the following requirements according to the appropriate category:

Category 1: For non-residential buildings and residential buildings over 3 stories:

Employ strategies that in aggregate use 30% less water than the water use baseline calculated for the building (not including irrigation) after meeting the Energy Policy Act of 1992 fixture performance requirements. Calculations are based on estimated occupant usage and shall include only the following fixtures (as applicable to the building): water closets, urinals, lavatory faucets, showers, and kitchen faucets.

Category 2: For residential buildings 3 stories or fewer:

Comply with all of the following requirements:

- The average flow rate for all lavatory faucets must be ≤ 2.0 GPM.
- The average flow rate for all shower heads must be ≤ 2.0 GPM.
- The average flow rate for all toilets, including dual-flush toilets, must be ≤ 1.3 GPF.

OR

OPTION 2 – OUTDOOR (1 point)

For irrigation, use only captured rainwater, recycled wastewater, recycled **graywater**, or water treated and conveyed by a public agency specifically for non-potable uses.

OR

Install landscaping that does not require permanent irrigation systems. Temporary irrigation systems used for plant establishment are allowed only if removed within one year of installation.

A point from Option 2 may be earned independently, or be added to those earned under Options 1, for a maximum of 3 points.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ An estimate of baseline indoor water use based on the type and number of buildings in the project.
- ❑ A written commitment to employ indoor water use reduction strategies to meet the requirements of the credit as appropriate to the number of points attempted if the project is built.

Option 2

- ❑ A site plan indicating areas of outdoor water use.
- ❑ A written commitment to employ outdoor water use reduction strategies to meet the requirements of the credit, including a list of strategies planned.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

Option 1

- ❑ For Category 1 buildings, submit: 1) a narrative describing the strategies that were used in the buildings to reduce water use; 2) a table showing each building's water use compared to the baseline fixture performance requirements of the Energy Policy Act of 1992; and 3) a calculation of the aggregate percentage of reduced water use for each building.
- ❑ For Category 2 buildings, submit a table showing the fixtures that were incorporated into each building that meet the flow rate specifications.

Option 2

- ❑ The total non-potable water supply in gallons available for irrigation purposes.
- ❑ A brief narrative describing the landscaping and irrigation design strategies employed by the project.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 4: Building Reuse and Adaptive Reuse
1 to 2 Points

Intent

Extend the life cycle of existing building stock, conserve resources, reduce waste, and reduce environmental impacts of new buildings as they relate to materials manufacturing and transport.

Requirements

Incorporate into the **project** the reuse of one building that maintains at least 50% (based on surface area) of the existing building structure (including structural floor and roof decking) and envelope (including exterior skin and framing, and excluding window assemblies and non-structural roofing material). Hazardous materials that are remediated as a part of the project scope shall be excluded from the calculation of the percentage maintained (1 point).

For projects reusing portions of two or more existing buildings, 1 additional point can be earned by incorporating into the project the reuse that achieves the greater of the following:

- 50% of 1 existing building plus an equivalent amount reused among one or more buildings (based on surface area, as defined above); or
- 20% of the existing building stock (based on surface area, as defined above)

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to maintain the percentage of building structure(s) to meet the requirements of the credit as appropriate to the number of points attempted if the project is built.
- ❑ For projects attempting to earn 2 points, confirmation of which compliance path the project will use and calculations demonstrating that it is the greater of the two.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ A table of the existing and reused areas in square feet of each structural/envelope element, and a calculation of the percentage of existing buildings reused.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 5: Reuse of Historic Buildings
1 Point

Intent

Encourage use of historic buildings in a manner that preserves their historic materials and character.

Requirements

Incorporate into the **project** one or more buildings that have been:

- designated, listed, or identified by a local government as a historic or contributing structure in a locally designated historic district pursuant to a local preservation ordinance;
  OR
- designated, listed, or identified as a historic or contributing structure in a historic district under a state historic register or on the National Register of Historic Places;

AND

Rehabilitate the building(s) in accordance with local or federal standards for rehabilitation, and:

- obtain confirmation from the municipality, and/or the local historic preservation commission that the plan(s) for rehabilitation meet the local standards for an historic rehabilitation,
  OR
- obtain confirmation from a State Historic Preservation Office or the National Park Service that the rehabilitation satisfies the Secretary of the Interior's "Standards for Rehabilitation."

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A document from the local government, the State Historic Preservation Officer, or the National Park Service stating the name and address of the property, its historic designation or status, and the date of designation. Other acceptable documents include a copy of the notice in the *Federal Register* or a verifiable copy of the web page of a state or national register that demonstrates the designation.

- ❑ A written commitment to incorporate and rehabilitate at least one historic building to meet the requirements of the credit if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ A document from the municipality, and/or the local historic preservation commission stating that the building(s) has complied with local requirements for a historic rehabilitation, including the name and address of the property or properties, and the date compliance was determined, or a document from the State Historic Preservation officer or the National Park Service, stating that the building(s) has complied with the Secretary of the Interior's "Standards for Rehabilitation," including the name and address of the certified property or properties and the date compliance was determined.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 6: Minimize Site Disturbance Through Site Design
1 Point

Intent

Preserve existing tree canopy, native vegetation and pervious surfaces while encouraging high **density**, smart growth communities.

Requirements

OPTION 1

Locate the **development footprint** on areas that are 100% **previously developed** and for which the zone of construction impact is 100% previously developed;

OR

OPTION 2

Depending on the density of the **project**, do not develop or disturb a proportion of the land that has not been previously developed on the site, exclusive of any land excluded from development by law or required to be preserved as a prerequisite of LEED for Neighborhood Development, and stipulate in **CC&Rs** or other binding development documents that the undisturbed area will be protected from development in perpetuity. Densities and minimum percentages are as follows (mixed use projects should use the lowest applicable density or calculate a weighted average per the methodology in NPD Credit 1: Compact Development):

Residential Density (DU/acre)	Non-Residential Density (**FAR**)	Minimum percentage of previously undeveloped site area to leave undisturbed
< 15	< .50	20%
15-21	.50 – 1.00	15%
> 21	> 1.0	10%

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

All Options

- ❑ A site plan indicating the location of any areas that are previously developed, the development footprint of the project, and the zone of construction impact.

Option 2

- ❑ A calculation showing the residential and/or non-residential density of the project.
- ❑ A calculation of the percentage of the previously undeveloped areas that will be left undisturbed.
- ❑ A copy of, or a written commitment to create, any necessary CC&Rs, development agreements, or other binding documents that will protect the undisturbed area according to the relevant credit requirements if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ For Option 2, if a written commitment to create the required agreements was submitted previously, submit a copy of the actual agreement(s).

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 7: Minimize Site Disturbance During Construction
1 Point

Intent

Conserve existing natural areas and protect trees to provide habitat and promote biodiversity.

Requirements

OPTION 1

Locate the **development footprint** on areas that are 100% **previously developed** and for which the zone of construction impact is 100% previously developed;

OR

OPTION 2

For portions of the site that are not previously developed: identify limits of disturbance through the creation of construction impact zones; and limit all site disturbance to 40 feet beyond the building perimeter; 10 feet beyond surface walkways, patios, surface parking and utilities less than 12 inches in diameter; 15 feet beyond primary roadway curbs and main utility branch trenches; and 25 feet beyond constructed areas with permeable surfaces (such as pervious paving areas, stormwater detention facilities and playing fields) that require additional staging areas in order to limit compaction in the constructed area.

OR

OPTION 3 – AVAILABLE FOR SITES WITH TREES ONLY

Survey the site to identify:

- trees in good or excellent condition as determined by a certified arborist,
- any Heritage or Champion trees of special importance to the community as defined by a jurisdictional City, County or State Forester because of their age, size, type, historical association or horticultural value,
- the caliper of all trees at 4'6" above ground (diameter at breast height or D.B.H.), and
- any invasive species of tree present on the site, and whether those species threaten the health of other trees to be preserved on the site, as determined by a certified arborist.

Preserve the following on the site that are also identified as in good or excellent condition:

- all Heritage or Champion Trees identified,
- a minimum of 75% of all non-invasive trees (including the above) over 18" in caliper (D.B.H.), and
- a minimum of 25% of all non-invasive trees (including the above) that are over 12" in caliper (D.B.H.) if deciduous, and 6" in caliper (D.B.H.) if conifer.

Develop a plan, in consultation with and approved by a certified arborist, for the health of the trees, including fertilization and pruning, and construction tree protection plans and specifications which are to include protection fencing located at the drip line of each tree, and specifying that if trenching or other disturbance is necessary within the drip line, this work must be done by hand. If a certified arborist has determined that the health of the trees to be preserved is threatened by invasive vegetation, develop a plan for invasive vegetation removal and restoration.

Stipulate in **CC&Rs** or other binding development documents that the preserved trees will be protected from development in perpetuity.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Options 1 and 2

- ❑ A site plan indicating the location of any areas that are previously developed, the development footprint of the project, and the zone of construction impact.

Option 3

- ❑ A site plan showing the locations of existing trees, and indicating which will be preserved.
- ❑ A summary of the survey conducted, highlighting the type and quantity of trees found, any Heritage or Champion trees, any trees with a caliper greater than 18”, and any invasive tree species present on the site.
- ❑ A list or summary of the trees to be preserved.
- ❑ A calculation of the percentage of non-invasive trees with a caliper greater than 12” or 6” (as appropriate to type) that will be preserved.
- ❑ A copy or summary of the maintenance plan developed in consultation with a certified arborist.
- ❑ A copy of, or a written commitment to create, any necessary CC&Rs, development agreements, or other binding documents that will protect the preserved trees according to the relevant credit requirements if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1
If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2
If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ For Option 3, if a written commitment to create the required agreements was submitted previously, submit a copy of the actual agreement(s).

Case 3B: Change since Stage 2
If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 8: Contaminant Reduction in Brownfields Remediation
1 Point

Intent

Encourage **brownfields** cleanup methods that reduce contaminant volume or toxicity and thereby minimize long-term remediation or monitoring burdens.

Requirements

Earn SLL Credit 1: Contaminated Brownfields Redevelopment;

AND

Use cleanup method(s) for 100% of the remediation that treat, reduce or eliminate the volume or toxicity of contaminated material found on the site.

Cleanup methods which include only capping or translocation of contaminated material to an off-site location will not achieve this credit.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site plan indicating the areas of contamination.
- ❑ A written commitment to meet the requirements of the credit if the project is built, and a brief narrative describing the types of contamination and the cleanup methods to be used.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ A brief narrative and/or technical drawings demonstrating the cleanup methods used.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 9: Stormwater Management
1 to 5 Points

JUNE 2007 VERSION

Note: Projects can use this version or the February 2007 version found in Appendix B.

Intent

Reduce adverse impacts on water resources by mimicking the natural hydrology of the region on the project site, including groundwater recharge. Reduce pollutant loadings from stormwater discharges, reduce peak flow rates to minimize stream channel erosion, and maintain or restore chemical, physical, and biological integrity of downstream waterways.

Requirements

OPTION 1 – FOR **PREVIOUSLY DEVELOPED SITES**

Implement a comprehensive stormwater management plan for the **project** that infiltrates, re-uses, or evapotranspirates the below-specified amount of rainfall from the project's **development footprint** and other areas that have been graded so as to be effectively impervious.

Points achievable	Arid Watersheds (less than 20" of rain/year)	Semi-arid Watersheds (between 20"-40" rain/year)	Humid Watersheds (at least 40" rain/year)
1 point	0.15"	0.225"	0.3"
2 points	0.3"	0.45"	0.6"
3 points	0.45"	0.675"	0.9"
4 points	0.6"	0.9"	1.2"
5 points	0.75"	1.125"	1.5"

OPTION 2 – FOR ALL OTHER SITES

Implement a comprehensive stormwater management plan for the project that infiltrates, re-uses, or evapotranspirates the below-specified amount of rainfall from the project's **development footprint** and other areas that have been graded so as to be effectively impervious.

Points achievable	Arid Watersheds (less than 20" of rain/year)	Semi-arid Watersheds (between 20"-40" rain/year)	Humid Watersheds (at least 40" rain/year)
1 point	0.3"	0.45"	0.6"
2 points	0.6"	0.9"	1.2"
3 points	0.9"	1.35"	1.8"

4 points	1.2”	1.8”	2.4”
5 points	1.5”	2.25”	3.0”

Notes: a) The stormwater management plan should identify practices to be employed, such as permeable pavements, rainwater harvesting systems or green roofs.
b) For the purposes of the calculations in this credit, the development footprint will include typically impervious surfaces included in the definition of “development footprint,” such as roofs and pavements, even though the surfaces may be made pervious as part of the stormwater management plan.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

All Options

- ❑ A site plan indicating the project’s development footprint, and the location of any planned stormwater management technologies or BMPs.
- ❑ A written commitment to develop and implement a comprehensive stormwater management plan to meet the requirements if the project is built.
- ❑ Confirmation of type of watershed.

Option 1

- ❑ A site plan indicating previously developed areas (this can be done as part of the site plan listed above).

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate “No change since Stage 1” on project checklist, and submit the following additional documentation:

All Options

- ❑ A summary of the stomwater management plan, highlighting the technologies or BMPs used on the site.

- ❑ A statement of the project team's capacity and/or qualifications to implement the plan, and/or a description of the services that will be contracted to do so.

<u>Case 2B: Change since Stage 1</u>
If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 3A: No change since Stage 2</u>
If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ A calculation of either 90% of the average annual rainfall or 1" of rainfall that occurs on the project's development footprint and other effectively impervious areas.
- ❑ A calculation of the percentage of the development footprint for which runoff will be infiltrated, re-used, or evapotranspirated.

<u>Case 3B: Change since Stage 2</u>
If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 10: Heat Island Reduction
1 Point

Intent

Reduce heat islands to minimize impact on microclimate and human and wildlife habitat.

Requirements

OPTION 1 – NON-ROOF

Provide any combination of the following strategies for 50% of the non-roof impervious site landscape (including roads, sidewalks, courtyards, parking lots, and driveways):

- Shade (within five years of occupancy)
- Paving materials with a Solar Reflectance Index (SRI) of at least 29
- Open grid pavement system

OR

Place a minimum of 50% of off-street parking spaces under cover (defined as underground, under deck, under roof, or under a building). Any roof used to shade or cover parking must have an SRI of at least 29;

OR

OPTION 2 – ROOF

Use roofing materials that have a Solar Reflectance Index (SRI) equal to or greater than the values in the table below for a minimum of 75% of the roof surface of all buildings within the **project**; or install a "green" (vegetated) roof for at least 50% of the roof area of all buildings within the project. Combinations of SRI compliant and vegetated roof can be used provided that they collectively cover 75% of the roof area of all buildings.

Roof Type	Slope	SRI
Low-Sloped Roof	≤ 2:12	78
Steep-Sloped Roof	≥ 2:12	29

Additional Notes

Shaded areas for the purposes of this credit will include areas shaded by trees, other landscape features, but not awnings, buildings, or other structural features.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A site plan indicating the location of any non-roof areas that will be employing the heat island reduction technologies or strategies listed in the requirements.
- ❑ A written commitment to employ sufficient non-roof heat island reduction strategies to meet the requirements, if the project is built.

Option 2

- ❑ A site plan indicating the location of any green roofs or roof areas that will have an SRI greater than or equal to those specified in the requirements.
- ❑ A written commitment to include a sufficient percentage of green roofs, or roofs with the specified SRI value to meet the requirements, if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

Option 1

- ❑ A table of strategies to be used and area covered by each, and a calculation of the percentage of non-roof impervious site landscape that will employ heat island reduction strategies.

Option 2

- ❑ A table of roof types to be used and roof area covered for each, and a calculation of the percentage of roof area that will be green roofs or roofs with the specified SRI value.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Green Construction & Technology

GCT Credit 11: Solar Orientation
1 Point

Intent

Achieve enhanced energy efficiency by creating the optimum conditions for the use of passive and active solar strategies.

Requirements

OPTION 1 – BLOCK DESIGN (AVAILABLE FOR **PROJECTS** EARNING AT LEAST 2 POINTS UNDER NPD CREDIT 1: COMPACT DEVELOPMENT)

Locate project on existing blocks, or design and orient project, such that for 75% or more of the project's blocks, one axis of each block is within 15 degrees of geographical east/west, and the east/west length of each block is at least as long, or longer, as the north/south length of the block.

OR

OPTION 2 – BUILDING DESIGN (AVAILABLE FOR ALL PROJECTS)

Design and orient 75% or more of the **project**'s buildings such that one axis of each building is at least 1.5 times longer than the other, and such that the longer axis is within 15 degrees of the geographical east/west axis. The length to width ratio shall be applied only to the length of walls enclosing conditioned spaces; walls enclosing unconditioned spaces such as garages, arcades, or porches cannot contribute to credit achievement. South-facing vertical surfaces of buildings counting towards credit achievement must not be more than 25% shaded at time of initial occupancy (measured at noon on December 21st).

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

Option 1

- ❑ A site plan indicating the axis of all relevant blocks, and their degree relation to the geographical east/west axis.
- ❑ A calculation of the percentage of blocks that have a long (or equal-length) axis within 15 degrees of geographical east/west axis.

Option 2

- ❑ A site plan indicating: 1) the axis of all relevant buildings and their degree relation to the geographical east/west axis; and 2) the length to width proportion of each relevant building.
- ❑ A cross section drawing showing any shading that would impact solar access for relevant buildings.
- ❑ A calculation of the percentage of buildings that the required proportions and their long axis within 15 degrees of geographical east/west axis.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist.

<u>Case 2B: Change since Stage 1</u>
If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 3A: No change since Stage 2</u>
If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

Option 2

- ❑ Drawings, diagrams, or photographs demonstrating the solar access for each relevant building, or a representative sample thereof.

<u>Case 3B: Change since Stage 2</u>
If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 12: On-Site Energy Generation
1 Point

Intent

Reduce air, water, and land pollution from energy consumption and production by increasing the efficiency of the power delivery system. Increase the reliability of power.

Requirements

OPTION 1 – (PRESCRIPTIVE) ELECTRICAL BASELINE

Develop on-site energy generation system(s) with peak electrical generating capacity of at least 5% of the **project**'s specified electrical service load.

OPTION 2 – (PERFORMANCE) TOTAL ENERGY BASELINE

Develop on-site energy generation system(s) with capacity of at least 5% of the project's annual electrical and thermal energy consumption, as established through an accepted building energy performance simulation tool.

For both options, total CO_2 emissions shall be less than or equal to national average of CO_2 emissions for grid supplied electricity, which shall be calculated as the sum of 1545 lb per MWh produced by the on-site power generation system and 145 lb per MMBtu of thermal energy produced by the on-site power generation system.

For both options, calculations for total on-site energy can include future site or building-integrated systems stipulated through **CC&Rs** or other binding documents.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to develop on-site energy generation system(s) to meet the requirements if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ A brief narrative describing the planned on-site energy generation system(s), including an estimate of the total project specified electrical service load or energy use, confirmation of which compliance path will be used, the type(s) of on-site energy system(s) to be used, and estimates of CO_2 emissions compared to the national average of grid supplied electricity.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

All Options

- ❑ A list of on-site energy generating system(s) used and the generation capacity of each.
- ❑ A calculation of total CO_2 emissions of the system compared to the national average for grid supplied electricity, as described in the requirements.

Option 1

- ❑ The total electrical service load of the project and a calculation showing the percentage that is generated by on-site system(s).

Option 2

- ❑ The total annual electrical and thermal energy consumption of the project, a calculation showing the percentage that is generated by on-site system(s), and confirmation of the building energy performance simulation tool used.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 13: On-Site Renewable Energy Sources
1 Point

Intent

Encourage on-site renewable energy self-supply in order to reduce environmental and economic impacts associated with fossil fuel energy use.

Requirements

OPTION 1 – (PRESCRIPTIVE) ELECTRICAL BASELINE

Design and incorporate the use of shared on-site nonpolluting renewable energy generation technologies such as solar, wind, geothermal, small scale/micro hydroelectric, and biomass with peak electrical generating capacity of at least 5% of the **project's** specified electrical service load.

OPTION 2 – (PERFORMANCE) TOTAL ENERGY BASELINE

Design and incorporate the use of shared on-site nonpolluting renewable energy generation technologies such as solar, wind, geothermal, small scale/micro hydroelectric, and biomass with peak electrical generating capacity of at least 5% of the project's annual electrical and thermal energy consumption, as established through an accepted building energy performance simulation tool.

For both options, calculations for total on-site energy can include future site or building-integrated systems stipulated through **CC&Rs** or other binding documents.

Additional Notes

Eligible Renewable Energy Systems

- **Electrical Systems:** Photovoltaic (PV), wind, hydro, wave, tidal, and bio-fuel based electrical production systems deployed at the project site.

- **Geothermal Energy Systems:** Geothermal energy systems using deep-earth water or steam sources (and not using vapor compression systems for heat transfer) deployed at the project site. These systems may either produce electric power or provide thermal energy for primary use at the building.
- **Solar Thermal Systems:** Active solar thermal energy systems that employ collection panels; heat transfer mechanical components, such as pumps or fans, and a defined heat storage system, such as a hot water tank or thermo-siphon solar and storage tank "batch heaters" deployed at the site.

Ineligible on-site renewable energy systems include geo-exchange systems (ground source heat pumps) and renewable or green-power from off-site sources. Eligible bio-fuels include untreated wood waste including mill residues, agricultural crops or waste, animal waste and other organic waste and landfill gas. Electrical production based on the following bio-fuels are excluded from eligibility for this credit:

combustion of municipal solid waste, forestry biomass waste, other than mill residue, wood that has been coated with paints, plastics, or formica and wood that has been treated for preservation with materials containing halogens, chlorine compounds, halide compounds, chromated copper arsenate (CCA), or arsenic. If more than 1% of the wood fuel has been treated with these compounds, the energy system shall be considered ineligible for this credit.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to develop on-site renewable energy generation system(s) to meet the requirements if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ A brief narrative describing the planned on-site renewable energy generation system(s), including an estimate of the specified electrical service load or total project energy use, confirmation of which compliance path will be used, and the type(s) of on-site energy system(s) to be used.

Case 2B: Change since Stage 1
If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)
Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

All Options

- ❑ A list of on-site renewable energy generating system(s) used and the generation capacity of each.

Option 1

- ❑ The total electrical service load of the project and a calculation showing the percentage that is generated by on-site renewable energy system(s).

Option 2

- ❑ The total annual electrical and thermal energy consumption of the project, a calculation showing the percentage that is generated by on-site renewable energy system(s), and confirmation of the building energy performance simulation tool used.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 14: District Heating & Cooling
1 Point

Intent

Reduce air, water, and land pollution resulting from energy consumption in buildings by employing energy efficient district technologies.

Requirements

Design and incorporate into the **project** a district heating and/or cooling system for space conditioning of all buildings in the project (at least 2 buildings total) such that at least 80% of the project total square footage is connected, and at least 80% of the project total peak heating or cooling load is connected.

The efficiency of each component of the system which is regulated by ASHRAE / IESNA 90.1-2004 must have an overall efficiency performance at least 10% better than specified by the ASHRAE 90.1 - 2004 Prescriptive Requirements. Additionally, pumping power must not exceed 2.5% of the thermal energy output (with one kWh of electricity equal to 3,413 Btu). Combined Heat and Power (CHP) district systems can achieve this credit by demonstrating equivalency relative to the above criteria.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to develop a district heating and/or cooling system to meet the requirements if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ A brief narrative describing the planned district heating or cooling system, including an estimate of the total project heating or cooling load, and which buildings will be connected.
- ❑ A list of components of the system that are regulated by ASHRAE / IESNA 90.1-2004, and the estimated efficiency of each compared to the relevant standard.
- ❑ Submit an estimate of pumping power as a percentage of thermal energy output.

<u>Case 2B: Change since Stage 1</u>

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 3A: No change since Stage 2</u>

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ The heating or cooling generation capacity of the system.
- ❑ The total heating or cooling load of the project, and a calculation showing the percentage that is generated by the district heating or cooling system.
- ❑ A calculation showing the percentage of the project total square footage that is connected.
- ❑ The efficiency of each component which is regulated by ASHRAE / IESNA 90.1-2004 compared to the relative standard.
- ❑ Submit the calculation of pumping power as a percentage of thermal energy output.

<u>Case 3B: Change since Stage 2</u>

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 15: Infrastructure Energy Efficiency
1 Point

Intent

Reduce air, water, and land pollution from energy consumption.

Requirements

Design or purchase any traffic lights, street lights, water and wastewater pumps and treatment systems that are included as part of the **project** to achieve a 15% annual energy reduction beyond an estimated baseline energy use for this infrastructure. If any traffic lights are installed as part of the project, use light emitting diode (LED) technology.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to meet the requirements for any of the specified infrastructure items used in the project if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ A list of the relevant infrastructure items to be used in the project.
- ❑ An estimate of the baseline energy use for these items.
- ❑ A brief narrative explaining how the 15% reduction in annual energy use will be achieved and demonstrated.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ A brief narrative and/or other documentation specified by the project beforehand (see Case 2A) demonstrating that the 15% reduction in energy use was achieved.
- ❑ Confirmation that LED technology was used for any traffic lights.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 16: Wastewater Management
1 Point

Intent

Reduce pollution from wastewater and encourage water reuse.

Requirements

Design and construct the **project** to divert at least 50% of the wastewater generated by the project, and reuse wastewater to replace the use of potable water. Provide for on-site wastewater treatment to a quality defined by state and local regulations for the proposed reuse.

50% of the wastewater is calculated by determining the total wastewater flow using conventional design practices in gallons per day and demonstrating that 50% of that volume enters an alternative, on-site process.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to divert, treat as necessary, and reuse wastewater on site to meet the requirements if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ An estimate of the amount of wastewater to be generated by the project.

- ❑ A brief narrative describing the technologies to be used for diversion and treatment, the estimated percentage of wastewater to be diverted, and the on-site reuses for the diverted wastewater.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ Applicable drawings from the construction documents that show the technologies used to divert, treat, and reuse wastewater.
- ❑ A calculation of the amount of wastewater generated by the project.
- ❑ A calculation of the amount of wastewater diverted, treated, and reused on site.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 17: Recycled Content in Infrastructure
1 Point

Intent

Use recycled materials to reduce the environmental impact of extraction and processing of virgin materials.

Requirements

Use the indicated recycled materials in all the following applications, if present in the **project**.

For roadways, parking lots, sidewalks, and curbs (above-ground structured parking and underground parking are exempt from this requirement):

- Any aggregate base and aggregate subbase shall be at least 90% by volume recycled aggregate materials such as crushed Portland cement concrete and asphalt concrete.
- Any asphalt base shall be a minimum 15% by volume recycled asphalt pavement.
- Any asphalt concrete pavement shall:
  - be a minimum 15% by volume recycled asphalt pavement, OR
  - be a minimum 75% by volume rubberized asphalt concrete from crumb rubber from scrap tires (crumb rubber modifier), OR
  - include a minimum of 5% (of total weight) of **pre-consumer** or **post-consumer** asphalt roofing shingles.
- Any Portland cement concrete pavement shall contain:
  - recycled mineral admixtures (such as coal fly ash, ground granulated blast furnace slag, rice hull ash, silica fume, or other pozzolanic industrial byproduct) to reduce by at least 25% the concrete mix's typical Portland cement content, AND
  - a minimum of 10% by volume reclaimed concrete material aggregate.

Piping made of Portland cement concrete shall contain recycled mineral admixtures (such as coal fly ash, ground granulated blast furnace slag, rice hull ash, silica fume, or other pozzolanic industrial byproduct) to reduce by at least 25% the concrete mix's typical Portland cement content.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to meet the requirements for recycled content in the specified applications, if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ A table of each material used on the project that is being tracked for recycled content, including the type of material and recycled content.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 18: Construction Waste Management
1 Point

Intent

Divert construction and demolition debris from disposal in landfills and incinerators. Redirect recyclable recovered resources back to the manufacturing process. Redirect reusable materials to appropriate sites.

Requirements

Recycle and/or salvage at least 50% of non-hazardous construction and demolition debris. Develop and implement a construction waste management plan that, at a minimum, identifies the materials to be diverted from disposal and whether the materials will be stored on-site or commingled. Excavated soil and land-clearing debris do not contribute to this credit. Calculations can be done by weight or volume, but must be consistent throughout.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A written commitment to recycle and/or salvage demolition debris to meet the requirements if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ A summary of the construction waste management plan.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ A table of the demolition debris, including a general description of each category of waste generated, the quantity in tons or cubic yards, and the location of receiving agent (recycler/landfill) for waste.
- ❑ A calculation showing the total percentage of material diverted from landfill disposal.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 19: Comprehensive Waste Management
1 Point

Intent

Reduce the waste hauled to and disposed of in landfills. Promote proper disposal of office and household hazardous waste streams.

Requirements

Meet at least two of the following three requirements and publicize the availability and benefits of the drop-off point(s), station(s), or services:

1) Include at least one drop-off point as part of the **project** available to all project occupants for office or household potentially hazardous wastes such as paints, solvents, oil, batteries; OR locate project in a local government jurisdiction that provides services for collecting these materials. If a plan for post-collection disposal or use does not exist, establish one.

2) Include at least one recycling or reuse station as part of the project available to all project occupants dedicated to the separation, collection, and storage of materials for recycling including, at a minimum, paper, corrugated cardboard, glass, plastics and metals; OR locate project in a local government jurisdiction that provides recycling services for these materials. If a plan for post-collection use does not exist, establish one.

3) Include at least one compost station as part of the project available to all project occupants dedicated to the collection and composting of food wastes; OR locate project in a local government jurisdiction that provides services for composting materials. If a plan for post-collection use does not exist, establish one.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)

Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site plan indicating the location of the drop-off points or stations and a written commitment to provide them if the project is built, or confirmation that the project site is located in a jurisdiction that provides services for collecting these materials, and a schedule or summary of those services.
- ❑ A written commitment to publicize the availability and benefits of the drop-off points or stations to project occupants if the project is built.
- ❑ Confirmation that a plan for post-collection disposal or reuse of materials exists, or a written commitment to create one if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ If the collection services will be provided as part of the project (rather than by the local jurisdiction), submit a brief narrative describing how the stations will be operated and any necessary plans for post-collection disposal or reuse of materials.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ Confirmation that the collection services are available to project occupants, and that any necessary plan for post-collection disposal or reuse of materials have been implemented.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Green Construction & Technology

GCT Credit 20: Light Pollution Reduction
1 Point

Intent

Minimize light trespass from site, reduce sky-glow to increase night sky access, improve nighttime visibility through glare reduction, and reduce development impact on nocturnal environments.

Requirements

For exterior lighting in **shared portions of the project**, only light areas as required for safety and comfort. Do not exceed 80% of the lighting power densities for exterior areas and 50% for building facades and landscape features as defined in ASHRAE/IESNA Standard 90.1-2004, Exterior Lighting Section, without addenda;

AND

Stipulate **CC&Rs** or other binding documents that require continued adherence to these standards.

All **projects** shall be classified under the following zones, as defined in IESNA RP-33, and shall follow all of the requirements for that specific zone:

LZ1 — Dark (Park and Rural Settings)
Design exterior lighting so that all site and building mounted luminaires produce a maximum initial illuminance value no greater than 0.01 horizontal and vertical footcandles at the site boundary and beyond. Document that 0% of the total initial designed fixture lumens are emitted at an angle of 90 degrees or higher from nadir (straight down).

LZ2 — Low (Residential areas)
Design exterior lighting so that all site and building mounted luminaires produce a maximum initial illuminance value no greater than 0.10 horizontal and vertical footcandles at the site boundary and no greater than 0.01 horizontal footcandles 10 feet beyond the site boundary. Document that no more than 2% of the total initial designed fixture lumens are emitted at an angle of 90 degrees or higher from nadir (straight down). For site boundaries that abut public rights-of-way, light trespass requirements may be met relative to the curb line instead of the site boundary.

LZ3 — Medium (Commercial/Industrial, High-Density Residential)
Design exterior lighting so that all site and building mounted luminaires produce a maximum initial illuminance value no greater than 0.20 horizontal and vertical footcandles at the site boundary and no greater than 0.01 horizontal footcandles 15 feet beyond the site. Document that no more than 5% of the total initial designed fixture lumens are emitted at an angle of 90 degrees or higher from nadir (straight down). For site boundaries that abut public rights-of-way, light trespass requirements may be met relative to the curb line instead of the site boundary.

LZ4 — High (Major City Centers, Entertainment Districts)

Design exterior lighting so that all site and building mounted luminaires produce a maximum initial illuminance value no greater than 0.60 horizontal and vertical footcandles at the site boundary and no greater than 0.01 horizontal footcandles 15 feet beyond the site. Document that no more than 10% of the total initial designed site lumens are emitted at an angle of 90 degrees or higher from nadir (straight down). For site boundaries that abut public rights-of-way, light trespass requirements may be met relative to the curb line instead of the site boundary.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ A site plan indicating shared portions of the project, and relevant sources of lighting.
- ❑ Confirmation of which LZ (lighting zone) the project is located in.
- ❑ A written commitment to reduce light pollution from shared portions of the project to meet the requirements if the project is built.
- ❑ A copy of, or a written commitment to create, any necessary CC&Rs, development agreements, or other binding documents that will require continued adherence to these standards.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

- ❑ A brief summary of the lighting design strategies that will be used to reduce light pollution from shared portions of the project.

<u>Case 2B: Change since Stage 1</u>
If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

<u>Case 2C: Did not submit at Stage 1</u>

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ Applicable lighting drawings from the construction documents that show the design strategies and/or technologies used to reduce light pollution from shared portions of the project.
- ❑ If a written commitment to create copies of the required agreements was submitted previously, submit a copy of the actual agreement(s).

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Innovation & Design Process

ID Credit 1: Innovation and Exemplary Performance
1 to 5 Points

Intent

To provide projects the opportunity to be awarded points for exceptional performance above the requirements set by the LEED for Neighborhood Development Rating System and/or innovative performance in green building, smart growth, or new urbanist categories not specifically addressed by the LEED for Neighborhood Development Rating System.

Requirements

In writing, identify the intent of the proposed innovation credit, the proposed requirement for compliance, the proposed submittals to demonstrate compliance, and the design approach and strategies that might be used to meet the requirements. (1 point each, up to 5 possible)

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ The specific title for the ID credit, a statement of the credit intent, and a statement of credit requirements.
- ❑ A narrative (and site plan if necessary) describing the project's approach to achievement of the credit, including a description of the quantifiable benefits of the credit proposal.
- ❑ A written commitment to meet the requirements (stated by the project team as part of the submission requirement above) if the project is built.

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate “No change since Stage 1” on project checklist.

Case 2B: Change since Stage 1
If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2
If project conditions remain unchanged with respect to credit requirements, indicate “No change since Stage 2” on project checklist, and submit the following additional post-construction documentation:

- ❑ Copies of any specific construction drawings or exhibits that will serve to illustrate the project’s approach to this credit. (Note: this may not be applicable to all ID credit proposals.)

Case 3B: Change since Stage 2
If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Innovation & Design Process

ID Credit 2: LEED Accredited Professional
1 Point

Intent

To support and encourage the planning and design integration required by a LEED for Neighborhood Development green neighborhood project and to streamline the application and certification process.

Requirements

At least one principal member of the **project** design team shall be a LEED Accredited Professional.

OR

At least one principal member of the project design team shall be a professional who is credentialed with regard to smart growth as determined by the Natural Resources Defense Council in consultation with Smart Growth America.

OR

At least one principal member of the project design team shall be a professional who is credentialed with regard to new urbanism as determined by the Congress for the New Urbanism.

OR

This point may be used instead as an additional point available under ID Credit 1: Innovation and Exemplary Performance, for performance not related to professional team member experience.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

- ❑ The name, place of employment, and a brief description of the project role for the individual.

- ❑ Confirmation of whether the individual is a LEED Accredited Professional, credentialed with regard to smart growth, or credentialed with regard to new urbanism.

For STAGE 2 Submissions (Certification of Approved Plan)

Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 2A: No change since Stage 1

If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, no additional documentation is required. Indicate "No change since Stage 1" on project checklist.

Case 2B: Change since Stage 1

If the project submitted at Stage 1, and project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2.

Definitions

Adapted (or introduced) Plants – Plants that reliably grow well in a given habitat with minimal attention from humans in the form of winter protection, pest protection, water irrigation, or fertilization once root systems are established in the soil. Adapted plants are low maintenance but not invasive.

Adaptive reuse – Conversion of an existing building that is functionally obsolete for its designed purpose to an updated purpose.

Adequate transit service – During **weekday peak periods**, at least four buses (including bus rapid transit), streetcars or light rail trains per hour OR at least 5 heavy passenger rail or ferries per weekday peak period.

Adjacent site – A site having at least 25% of its perimeter bordering land that has been **previously developed.** For the puposes of this definition**,** a street or roadway does not constitute previously developed land. Any fraction of the perimeter that borders waterfront will be excluded from the calculation.

Area median income – The median, or middle, income of a county as defined and available from the U.S. Department of Housing and Urban Development.

Biking network – A continuous network consisting of one or more of the following: bicycle lanes or trails at least 5 feet wide or roads designed for a speed of 10 miles per hour or slower.

Block – Land bounded by the project boundary, dedicated transportation or utility rights-of-way, waterfront, and/or comparable land division features.

Brownfield – Real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminate. (U.S. EPA)

Buildable land – The portion of the site where construction can occur. When used in **density** calculations, the calculation for buildable land excludes: public streets and other public rights of way, and land excluded from development by law or other prerequisites of LEED for Neighborhood Development.

Buildout – The time at which all **habitable buildings** on the project are complete and ready for occupancy.

Class I Bikeway - Class I bikeways are defined as bicycle or multi-use facilities that are completely separate from the vehicular right-of-way. The standard Class I bikeway has pavement that is 8 feet wide however the exact design requirements for Class I bikeways differ from jurisdiction to jurisdiction.

Community Supported Agriculture (CSA) – A farm operation for which a community of individuals who pledge support so that the farmland becomes, either legally or informally, the community's farm. The growers and consumers provide mutual support, sharing the risks and benefits of food production. Consumers receive portions of the farm's harvest throughout the growing season.

Covenants, Conditions and Restrictions (CC&Rs) – Limitations that may be placed on a property and its use, and which are made a condition of holding title or lease.

Density – Density is the amount of building structures constructed on the project site, measured for residential buildings as dwelling units per acre of **buildable land** available for residential uses, and for non-residential buildings as the floor area ratio per acre of buildable land area available for non-residential uses.

Development footprint – The total land area of a **project** site covered by buildings, streets, parking areas, and other typically impermeable surfaces constructed as part of the project.

Floor Area Ratio (FAR) – The measure of the **density** of non-residential land use. It is the total non-residential building floor area divided by the total **buildable land** area available for non-residential uses. For example, on a site with 10,000 square feet of buildable land area, an FAR of 1.0 would be 10,000 square feet of built building floor area. On the same site, an FAR of 1.5 would be 15,000 square feet of built floor area; an FAR of 2.0 would be 20,000 built square feet and an FAR of 0.5 would be 5,000 built square feet.

Functional entry – An entryway that is designed to be used by pedestrians and is open during regular business hours. This does not include any door that is exclusively designated as an emergency exit, or a garage door that is not designed as an entrance for pedestrians.

Graywater – Untreated household waste water which has not come into contact with toilet waste. Gray water includes used water from bathtubs, showers, bathroom wash basins, and water from clothes-washer and laundry tubs. It shall not include waste water from kitchen sinks or dishwashers. Some states and local authorities allow kitchen sink wastewater to be included in graywater. Project teams should comply with graywater definitions as established by the authority having jurisdiction in their areas. (Uniform Plumbing Code)

Habitable building – A structure that is intended for living, working, or other types of occupancy. Habitable structures do not include buildings such as garages and pump stations.

HERS Index – A scoring system established by the Residential Energy Services Network (RESNET) in which a home built to the specifications of the HERS Reference Home (based on the 2006 International Energy Conservation Code) scores a HERS Index of 100, while a net zero energy home scores a HERS Index of 0. The lower a home's HERS Index, the more energy efficient it is in comparison to the HERS Reference Home.

Infill site – A site having at least 75% of its perimeter bordering sites that have been **previously developed**. For the puposes of this definition, a street or roadway does not constitute previously developed land. Any fraction of the perimeter that borders waterfront will be excluded from the calculation.

IECC – International Energy Conservation Code

Invasive Plants – Plants that may be either indigenous or non-indigenous species or strains that are characteristically adaptable, aggressive, have a high reproductive capacity and tend to overrun the ecosystems in which they inhabit.

Native (or indigenous) Plants – Plants that have adapted to a given area during a defined time period and are not invasive. In America, the term often refers to plants growing in a region prior to the time of settlement by people of European descent.

Neighborhood – An area of dwellings and/or work places and their immediate environment that residents and/or employees identify with in terms of social and economic attitudes, lifestyles, and institutions.

Post-consumer – Generated by households or by commercial, industrial and institutional facilities in their role as end-users of a product, which can no longer be used for its intended purpose.

Pre-consumer – Diverted from the waste stream during the manufacturing process. It does not include the reutilization of materials such as rework, regrind or scrap generated in a process and capable of being reclaimed within the same process that generated it.

Pre-development – Before any development occurred on the site. Pre-development conditions describe the natural conditions of the site prior to any human alteration, i.e. development of roads, buildings, etc.

Previously developed – Having pre-existing paving, construction, or altered landscapes. This does not apply to altered landscapes resulting from current agricultural use, forestry use, or use as preserved natural area.

Previously developed site – A site consisting of at least 75% **previously developed** land**.**

Pre-project – Before the **project** was initiated, but not necessarily before any development or disturbance took place on the site. Pre-project conditions describe site conditions as the current developer or project applicant found them.

Prime soils – Soils with chemical, hydrographic and topological properties that make them especially suited to the production of crops. The Natural Resources Conservation Agency is responsible for identifying prime soils, and they make detailed soil surveys and maps available for every county in the United States. All of the NRCS data are available for download to GIS mapping programs.

Project – The land and construction that constitutes the basis for LEED for Neighborhood Development application.

Project boundary – The outermost property line of the **project**. Projects located on publicly-owned campuses that do not have internal property lines shall delineate a sphere of influence line to be used in place of "property line." The phrase 'project site' is equivalent to the land inside the project boundary.

School – An institution for the academic instruction of children or adults, technical trade school, arts school, college, or university.

Shared portions of the project – Areas of the **project** that are publicly-owned, such as streets and parks, and land and facilities that are held under common ownership by entities such as a condominium association, land trust, or privately owned corporations.

Street grid density – The density of the street network as measured in centerline miles per square mile. Areas that shall be excluded from the calculation are water bodies, parks, recreational facilities, public campus facilities (such as universities), areas preserved from development because of local, state, or federal law, land preserved from development from the prerequisites of LEED for Neighborhood Development, land that cannot be developed due to a unique topographic or geologic condition (such as steep slopes).

Toe of the slope – Where there is a distinct break between a 40% slope and lesser slopes.

Unique soils – Soils with chemical, hydrographic and topological properties that make them especially suited to specific crops. The Natural Resources Conservation Agency is responsible for identifying unique soils, and they make detailed soil surveys and maps available for every county in the United States. All of the NRCS data are available for download to GIS mapping programs.

Walk distance – The distance that a pedestrian must travel between destinations without obstruction, in a safe and comfortable environment such as on sidewalks, footpaths or other pedestrian facilities.

Water bodies – The surface water of a stream, creek, river, lake, estuary, bay, or ocean.

Weekday peak periods –Weekdays between 5:30 a.m. to 10:30 a.m. and 3:30 p.m. to 8:30 p.m. The period of time during the weekday commute when traffic congestion is the greatest.

Wetlands – Areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas." http://www.wetlands.com/regs/tlpge02e.htm (1987 Army Corps of Engineers Manual)

Vehicle Miles Traveled (VMT) – The number of miles traveled by motor vehicles in a specified period of time, such as a day or a year, by a number of motorists in absolute or per capita terms.

Woonerf – A Dutch word that means "street for living." In practice, it is common space shared by pedestrians, bicyclists, and low-speed motor vehicles. They are usually streets raised to the same grade as curbs and sidewalks. Vehicles are slowed by placing trees, planters, parking areas, and other obstacles in the street, so that motorists travel at walking speed.

Appendix A: List of Diverse Uses

Bank
Child care facility (licensed)
Community/civic center
Convenience store
Hair care
Hardware store
Health club or outdoor recreation facility
Laundry/dry cleaner
Library
Medical/dental office
Pharmacy (stand-alone)
Place of worship
Police/fire station
Post office
Restaurant
School
Senior care facility
Supermarket
Theater

Appendix B:

GCT Credit 9: Stormwater Management

1 to 5 Points

FEBRUARY 2007 VERSION

Note: Projects can use this version or the June 2007 version found in the GCT Section.

Intent

Reduce pollution and hydrologic instability from stormwater, prevent flooding, and promote aquifer recharge.

Requirements

OPTION 1 – FOR **PREVIOUSLY DEVELOPED SITES** OF ANY SIZE AND **INFILL SITES** OF LESS THAN 7 ACRES

Implement a comprehensive stormwater management plan for the **project** that infiltrates, re-uses, or evapotranspirates runoff from 90% of the average annual rainfall or 1” of rainfall from a percentage of the project’s **development footprint** and other areas that have been graded so as to be effectively impervious, as listed below.

Minimum 15% of the development footprint	(1 point)
Minimum 30% of the development footprint	(2 points)
Minimum 45% of the development footprint	(3 points)
Minimum 60% of the development footprint	(4 points)
Minimum 75% of the development footprint	(5 points)

OPTION 2 – FOR ALL OTHER SITES

Implement a comprehensive stormwater management plan for the project that infiltrates, re-uses, or evapotranspirates runoff from 90% of the average annual rainfall or 1” of rainfall from a percentage of the project’s **development footprint** as listed below.

Minimum 20% of the development footprint	(1 point)
Minimum 40% of the development footprint	(2 points)
Minimum 60% of the development footprint	(3 points)
Minimum 80% of the development footprint	(4 points)
Minimum 100% of the development footprint	(5 points)

Notes: a) The stormwater management plan should identify practices to be employed, such as permeable pavements, rainwater harvesting systems or green roofs.
b) For the purposes of this calculations in this credit, the development footprint will include typically impervious surfaces included in the definition of “development

footprint," such as roofs and pavements, even though the surfaces may be made pervious as part of the stormwater management plan.

Submittals

During the pilot program, project teams are encouraged to suggest replacement documentation that may be easier to access or produce than the items listed below, but still clearly verifies that the requirements have been met. The certification reviewers will evaluate the adequacy of the potential replacement documentation on a case-by-case basis.

- ❑ Provide the LEED submittal template, signed by the responsible party, declaring that the requirements have been met, and the following:

For STAGE 1 Submissions (Pre-review)
Submitting for Stage 1 is optional. If it is skipped, these items will be required at Stage 2.

All Options

- ❑ A site plan indicating the project's development footprint, and the location of any planned stormwater management technologies or BMPs.
- ❑ A written commitment to develop and implement a comprehensive stormwater management plan to meet the requirements if the project is built.

Option 1

- ❑ A site plan indicating the size of the project and any previously developed areas (this can be done as part of the site plan listed above).

For STAGE 2 Submissions (Certification of Approved Plan)
Stage 2 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

<u>Case 2A: No change since Stage 1</u>
If the project submitted at Stage 1, and project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 1" on project checklist, and submit the following additional documentation:

All Options

- ❑ A summary of the stomwater management plan, highlighting the technologies or BMPs used on the site.
- ❑ A statement of the project team's capacity and/or qualifications to implement the plan, and/or a description of the services that will be contracted to do so.

<u>Case 2B: Change since Stage 1</u>
If the project submitted at Stage 1, and project conditions have changed with respect to prerequisite requirements:

- ❑ Submit updated versions of the relevant documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

Case 2C: Did not submit at Stage 1

- ❑ Submit the documentation required at Stage 1 and the additional item(s) listed above in Case 2A.

For STAGE 3 Submissions (Certification of Completed Neighborhood Development)

Stage 3 must be completed. If a project is already built, Stage 2 and 3 documentation may be submitted simultaneously.

Case 3A: No change since Stage 2

If project conditions remain unchanged with respect to credit requirements, indicate "No change since Stage 2" on project checklist, and submit the following additional post-construction documentation:

- ❑ A calculation of either 90% of the average annual rainfall or 1" of rainfall that occurs on the project's development footprint and other effectively impervious areas.
- ❑ A calculation of the percentage of the development footprint for which runoff will be infiltrated, re-used, or evapotranspirated.

Case 3B: Change since Stage 2

If project conditions have changed with respect to credit requirements:

- ❑ Submit updated versions of the relevant documentation submitted at Stage 2 and the additional item(s) listed above in Case 3A.

Water Q&A: Water use at home

---

(1) Q: Where does our household water come from?

A: All of the water that we use in our homes comes from either a ground-water source, such as a well, or from a surface-water source, such a river, lake, or reservoir. In the U.S. in 2000, about 240 million of the 285 million people in the United States got their home water delivered by a public supplier, such as the county water department. At other homes, people provide water for themselves from sources, such as a well, a cistern, a pond, or a stream.

(2) Q: Where does it go after we are done with it?

A: Water leaving our homes generally goes either into a septic tank in the back yard where it evaporates or seeps back into the ground, or is sent to a sewage-treatment plant through a sewer system. In 1995, the last year for which consumptive-use data was compiled, about 26 percent of the water coming from our homes was "consumptively used." That is, it was evaporated or transpired from yards. The other 74 percent was discharged to septic tanks or sewage-treatment plants, where it was cleaned and sent into streams, or sometimes reused for other purposes, such as watering golf courses and parks.

(3) Q: How much water does the average person use at home per day?

A: Estimates vary, but each person uses about 80-100 gallons of water per day. Are you surprised that the largest use of household water is to flush the toilet, and after that, to take showers and baths? That is why, in these days of water conservation, we are starting to see toilets and showers that use less water than before. Many local governments now have laws that specify that water faucets, toilets, and showers only allow a certain amount of water flow per minute. In fact, if you look real close at the head of a faucet, you might see something like "1.5 gpm,", which means that the faucet head will allow water to flow at a maximum of 1.5 gallons per minute.

(4) Q: How is water supplied to our homes?

A: In a modern society such as ours, much work goes into supplying our houses with water. Many years ago when everyone lived in rural areas, they would have to get their own water from rivers or from local wells.

Nowadays, most people in the U.S. live in towns and cities, and communities have installed an organized structure called a public water-supply system to provide water to homes (and to some businesses and industries, too). Now, even many rural areas have similar systems. In 2000, the U.S. had a population of about 285 million. About 240 million people had their water delivered from a public-supply system, and about 45 million people supplied their own water (over 90 percent of these people use water from their own wells).

---

(5) Q: How is the water I drink made safe?

A: Different treatment is used depending on the source of your water. Ground water taken from wells has been filtered through rocks, so it is usually quite free of particles. It can still contain chemicals and organic matter that must be taken out, though. If your water comes from a surface-water source, such as a river, some work must be done to get rid of particulate matter. In this case filters are used to screen out large particles, and at a minimum, chlorine is added to kill dangerous bacteria and microorganisms. Some systems have additional water treatment, such as adding chemicals to make matter bunch up (flocculate) and fall out of solution and adding chemicals to make the water less corrosive to metal.

---

(6) Q: Is it true that water coming out of sewage treatment plants is used for other purposes?

A: Yes, it is called reclaimed wastewater, though its use is limited. Before you start to feel ill, no, it is not used further down the line as drinking water. It is most often used for irrigation and for water parks and golf courses. In the U.S. in 1995 (the last year for which wastewater-treatment data was compiled) about 44,400 wastewater-treatment plants sent about 44,600 million gallons per day of treated water back into the environment. About 983 million gallons per day was used again (reclaimed) after treatment, mainly as irrigation water.

---

(7) Q: I live on a hill, how does water get to my house?

A: Let's assume that you get your water from the local water department through pipes buried below the streets. In other words, you don't have your own well in your back yard. Chances are that you get your water through the magic of gravity or pumps. Cities and towns build those big water towers on top of the highest hills and then fill them with water. So even if you live on a hill, there's a good chance the water tower is higher than your house. Water goes down a large pipe from the tower and through an intricate network of pipes that eventually reaches your house.

A: In other words, when I have a big storm over my house, just how much rain am I getting? Let's say your house sits on a one-half acre lot. And let's say you get a storm that drops 1 inch of rain. You've just received 13,577 gallons of water on your yard! A big bath holds about 50 gallons of water, so if you could save that inch of water that fell you could take a daily bath for 271 days! (Careful now, that 13,577 gallons of water weighs over 56 tons ... so don't put it in your bathtub all at once).
Let's expand that to a city. Atlanta, Ga. has corporate boundaries that cover about 84,100 acres (U.S. Census Bureau). A 1-inch rainstorm deposits 27,154 gallons on one acre, so during this storm Atlanta receives 2.28 billion gallons of water.

Don't miss our Challenge Question, where you can find out how much water falls during a rainstorm.

---

(9) Q: Does a little leak in my house really waste water?

A: It's not the little leak that wastes water -- it is the little leak that keeps on leaking that wastes water. And the fact that the leak is so little means that maybe you ignore it. So, how can a little leak turn into a big waste?

Many of our toilets have a constant leak -- somewhere around 22 gallons per day. This translates into about 8,000 gallons per year of wasted water, water that could be saved. Or think of a leaky water line coming into your house. If it leaks 1 gallon of water every 10 minutes that means that you are losing (and paying for) 144 gallons per day, or 52,560 gallons per year.

Use our leak calculator to see how much a leaking faucet wastes.

Assessment of HCFC-Based Air Conditioning Equipment and Emerging Alternative Technologies

Final Report

Prepared for

The World Bank
Montreal Protocol Operations
Environment Department
1818 H Street, NW
Washington, DC 20433 USA

Prepared by

ICF International
1725 Eye Street, NW
Washington, DC 20006 USA

September 2007

Prepared prior to the HCFC Adjustments agreed upon at the 19th Meeting of the Parties (MOP) to the Montreal Protocol.

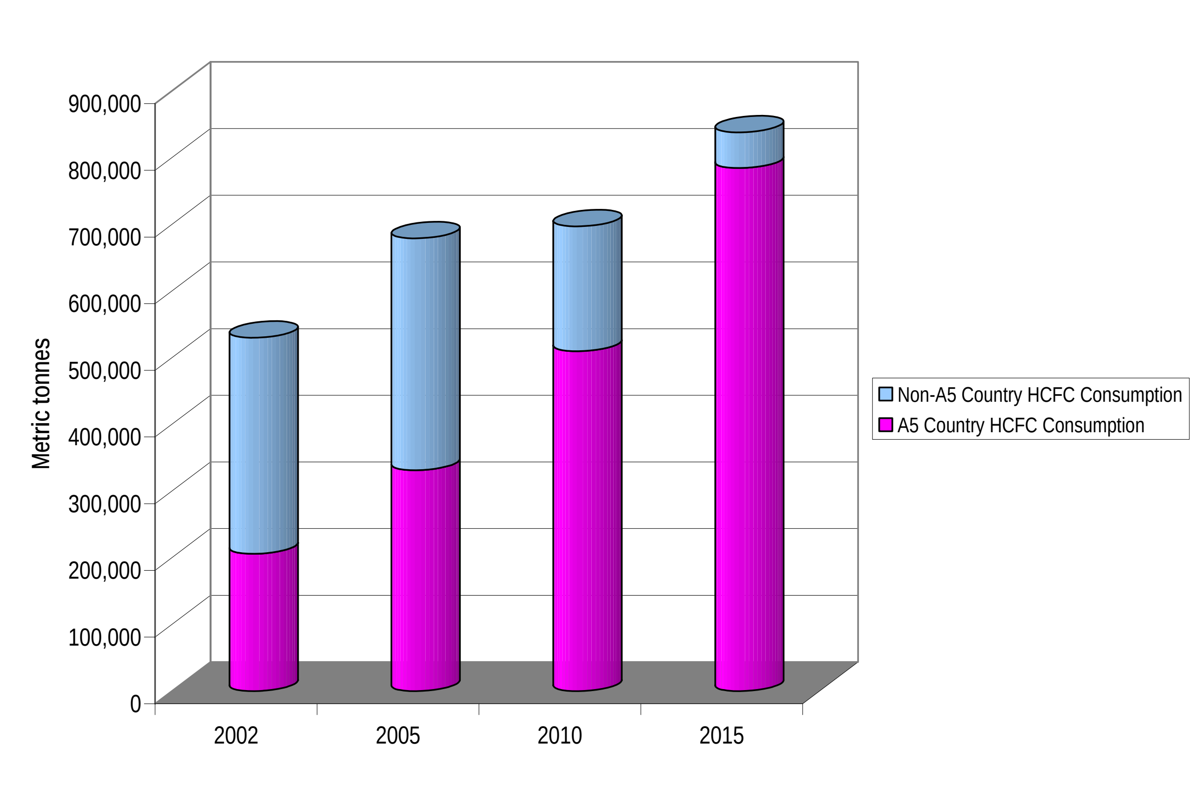
Table of Contents

1. Introduction

The production and consumption of ozone-depleting hydrochlorofluorocarbons (HCFCs)—used as refrigerants, blowing agents, solvents, aerosols, and fire suppressants—are increasing rapidly in developing countries, even as they are being gradually phased out in developed countries under the current phaseout requirements for non-A5 countries, as articulated under the Montreal Protocol and subsequent adjustments and amendments. From 2005 to 2015, although consumption of HCFCs in developed countries will be reduced by approximately 85%, global consumption will increase by more than 20%, as consumption in developing countries increases by more than 135% during that same period (US EPA 2007a).

Indeed, because the cap on the consumption of HCFCs in developing countries does not enter into effect until 2016, annual consumption growth rates from 2005 to 2015 are impossible to know with certainty, but available reported information indicates a value of 9% (ICF estimates).[1] Assuming this growth rate of 9%, Exhibit 1 graphically presents the projected increase in demand for HCFCs in developing (Article 5 or A5) countries compared to the projected decrease in demand in developed (non-Article 5 or non-A5) countries.

Exhibit 1: Historical and Projected Consumption of HCFCs in A5 and non-A5 Countries



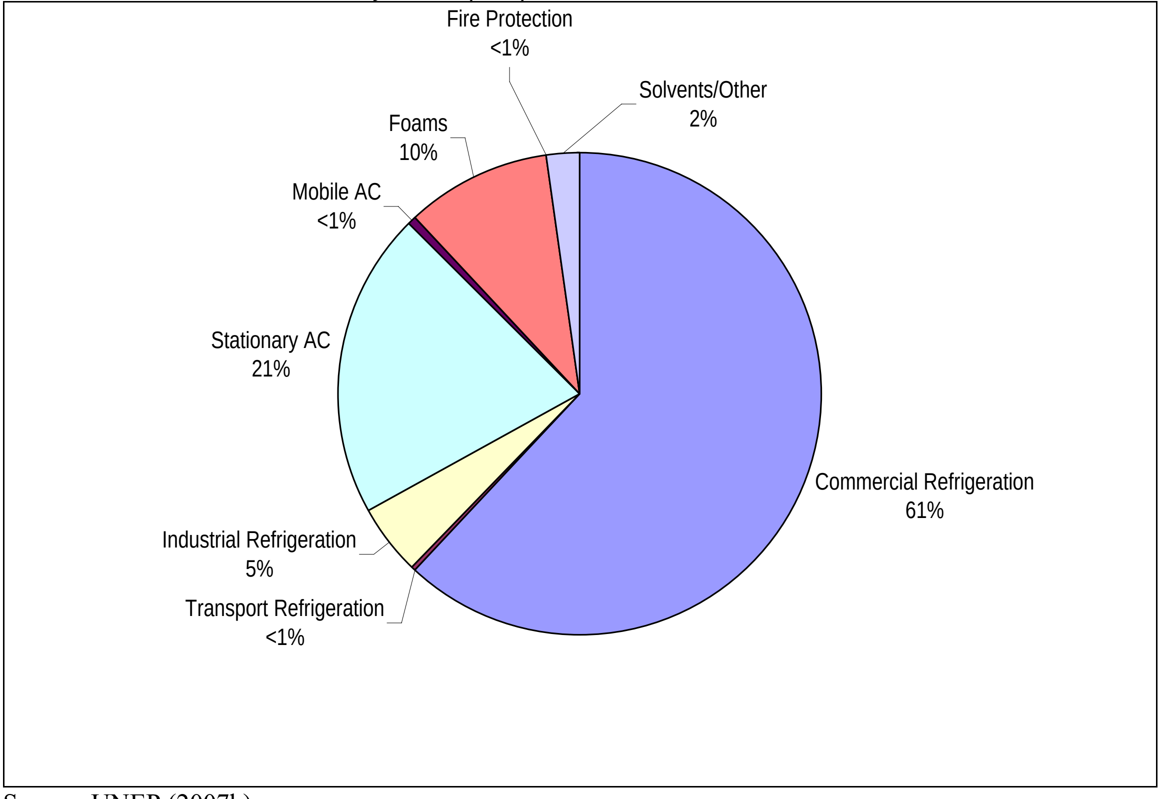
Source: US EPA (2007a).

[1] This growth rate was developed by ICF through an effort to harmonize existing projections used by Parties in assessing and negotiating an expedited HCFC phaseout schedule, and is based primarily on actual and projected consumption and production estimates provided by A5 countries through the *Study on the Strategy for the Long Term Management of HCFCs in China and HCFC Surveys in Nine Article 5 Countries*. Other proposed annual growth rates range from 10.9% (World Bank 2006) to 5.9% (IPCC/TEAP 2005) to about 5% (UNEP 2007a). The TEAP XVIII/12 report (UNEP 2007b) based its baseline calculations on the growth rates developed in the SROC (average rate of 5.9%), but recognized that the SROC demand growth is relatively conservative (i.e., low growth compared to other assessments).

Moreover, because the Protocol does not require developing countries to reduce consumption until 2040, global HCFC consumption could remain excessively high for the next 35 years, undermining the phaseout efforts of developed countries and threatening the recovery of the ozone layer and posing threats to human health and the environment from excess UV radiation. These projected high levels of HCFC consumption will also have impacts on global climate change, through both direct and indirect processes. From this standpoint, an accelerated phase-out of HCFCs in developed and developing countries is imperative.

Any proposed accelerated phase-out schedule must take into account the costs of early retirement of HCFC equipment, particularly in the stationary AC sector, which currently represents the second largest source (about 20%) of total A5 HCFC demand, as shown in Exhibit 2 (US EPA 2007a, UNEP 2007b). Moreover, because large AC systems (chillers) have long lifetimes and high replacement costs, and because the import/export of smaller AC equipment significantly affect Article 5 economies, a technical assessment of the stationary air-conditioning market in Article 5 countries is needed to gain an understanding of the impacts and costs associated with an expedited HCFC phaseout.

Exhibit 2: Total A5 HCFC Demand by Sector (2005)



Source: UNEP (2007b)

The purpose of this report is to provide the international community with an understanding of where and how much HCFCs will be installed within the stationary AC sector in Article 5 countries under a business-as-usual scenario, and what it will take to achieve phaseout. To this end, the report assesses current and projected A5 consumption of HCFCs in stationary AC applications, as well as the feasibility and likelihood of using non-ODS refrigerants in this sector through 2015 and beyond. The report also provides broad analysis of the costs of transitions to alternative refrigerants in existing and new equipment and identifies barriers associated with (a) the replacement and servicing of HCFC-based chillers and (b) the conversion of manufacturing facilities reliant on HCFC refrigerant for the production of smaller AC equipment in A5 countries.

The remainder of the report is organized as follows:

- Section 2 provides background information on ODS consumption, focusing on the commercial and residential air-conditioning sector in A5 countries;
- Section 3 provides an overview of the methodology used to prepare this report;
- Section 4 characterizes the chiller sector in A5 countries, providing estimated number of units installed by chiller type and refrigerant type, summarizing available alternatives, and projecting future refrigerant transitions;
- Section 5 characterizes the residential and small commercial air-conditioning market in A5 countries, providing estimated number of units installed by refrigerant type, summarizing available alternatives, and projecting future refrigerant transitions;
- Section 6 summarizes the results from Sections 4 and 5 and discusses the implications for A5 phaseout in terms of the cost to replace/service HCFC chillers and convert AC equipment manufacturing facilities reliant on HCFC refrigerant;
- Section 7 presents the references used in this report;
- Appendix 1 presents the questionnaires used in collecting information from industry and government sources;
- Appendix 2 provides a list of major chiller and air conditioning equipment manufacturers; and
- Appendix 3 presents detailed results on projected AC stocks by equipment type, refrigerant type, and A5 region.

2. Background: HCFC Consumption in Article 5 Countries

Currently, 191 nations are Parties to the Montreal Protocol, a landmark international agreement to restore the Earth's deteriorating stratospheric ozone layer. The global success of this effort to protect the environment requires the elimination of emissions to the atmosphere of ozone-depleting substances (ODS). Chlorofluorocarbons (CFCs)—used as refrigerants, blowing agents, solvents, and aerosols—are some of the most damaging ODS, and their phaseout in non-A5 countries was implemented in 1996. Hydrochlorofluorocarbons (HCFCs), used in part as replacements for CFCs, also deplete the stratospheric ozone layer and are controlled under the Montreal Protocol as Annex C Group 1 substances. In non-A5 countries, HCFC consumption is being reduced progressively to reach complete phaseout in 2030. In A5 countries, CFCs are scheduled for complete phaseout in 2010, while HCFCs are scheduled for complete phaseout in 2040 (with a freeze in 2016 at 2015 consumption levels).

While ODS have a wide variety of applications, the most common uses for CFCs and HCFCs are in the refrigeration and air conditioning (AC) sectors. In 2005, an estimated 75% of total global demand for CFCs and HCFCs was in the refrigeration/AC sector (UNEP 2007b). Exhibit 3 presents the most common CFC and HCFC refrigerants and their ODPs.

Exhibit 3: Common CFC and HCFC Refrigerants and their ODPs

Chemical Name	ODP
CFC-11 (CCl_3F)	1
CFC-12 (CCl_2F_2)	1
HCFC-22 (CHF_2Cl)	0.055
HCFC-123 ($C_2HF_3Cl_2$)	0.02
HCFC-124 (C_2HF_4Cl)*	0.022
HCFC-142b (CH_3CF_2Cl)*	0.065

*Used in blends only.

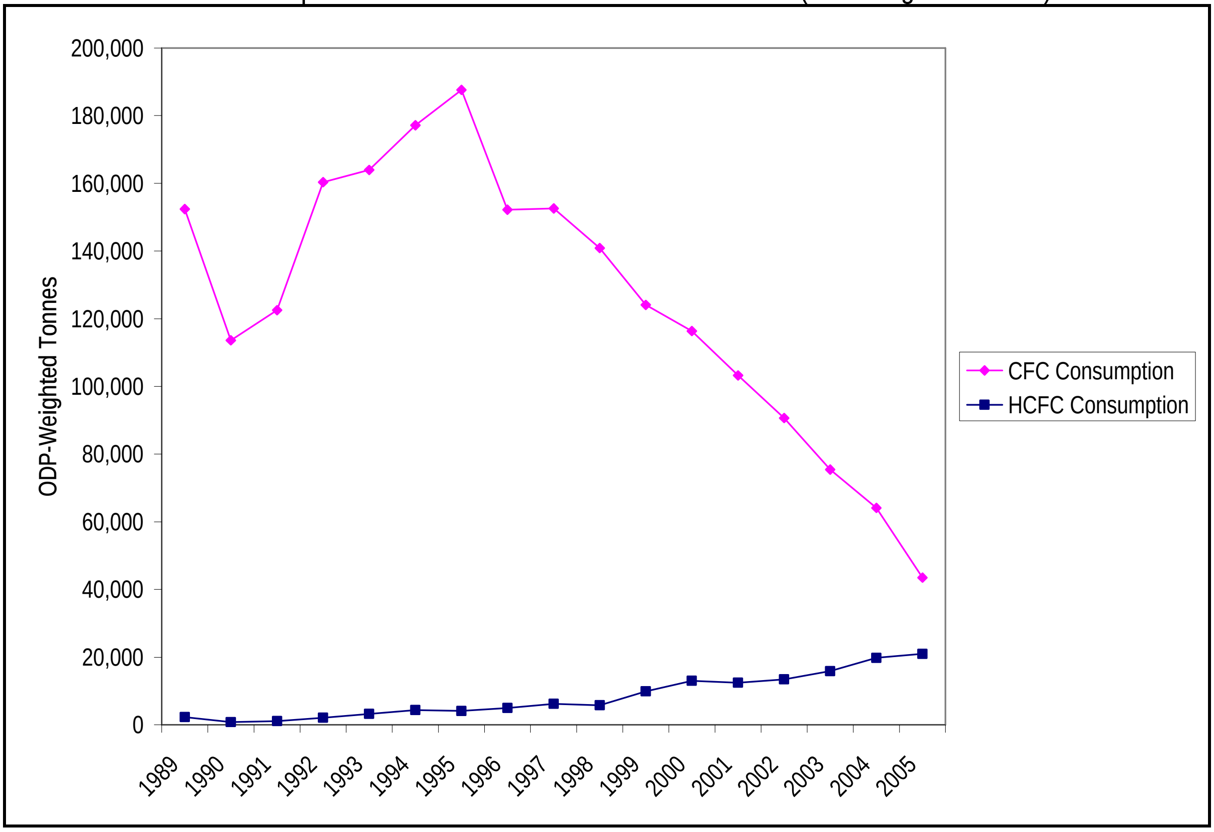
As a result of the global CFC phaseout underway, CFCs used in the refrigeration/AC and other sectors have declined steadily over time (see Exhibit 4 and Exhibit 5). By 2005, CFCs comprised only about 23% of ODS demand in the refrigeration/AC sector in A5 countries, and 21% in non-A5 countries (where CFC phaseout began earlier). As the CFC phaseout continues to progress, demand for CFCs is expected to decrease to less than 2% of A5 demand for ODS in the refrigeration/AC sector in 2015, and approximately 7% of non-A5 demand. (UNEP 2007b)

At the same time, the demand for HCFCs in the refrigeration/AC and other sectors has risen and will continue to rise steadily as market growth spurs demand (see Exhibit 4 and Exhibit 5). Indeed, by 2005, annual consumption of HCFCs had more than doubled in A5 countries relative to consumption in 1999, reaching 20,976 ODP-weighted tons (UNEP 2007c). From 2005 to 2015, HCFC consumption will grow at an estimated average rate of 9%[2] in A5 countries, though some country growth rates (e.g., China, India) may be significantly higher (ICF estimates). Overall, HCFC growth rates are likely to correlate with the industrial growth rates of A5 countries.

---

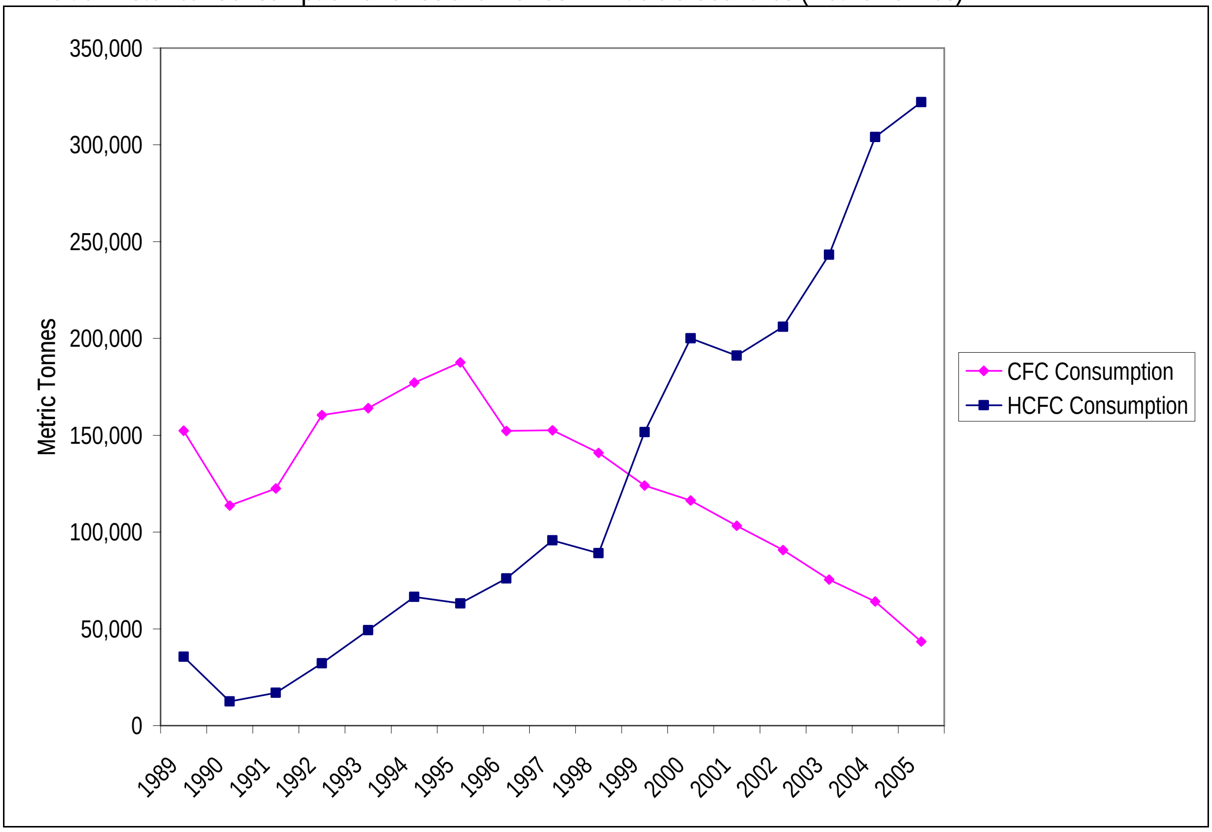
[2] This growth rate was developed by ICF through an effort to harmonize existing projections used by Parties in assessing and negotiating an expedited HCFC phaseout schedule, and is based primarily on actual and projected consumption and production estimates provided by A5 countries through the *Study on the Strategy for the Long Term Management of HCFCs in China and HCFC Surveys in Nine Article 5 Countries*. Other proposed annual growth rates range from 10.9% (World Bank 2006) to 5.9% (IPCC/TEAP 2005) to about 5% (UNEP 2007a). The TEAP XVIII/12 report (UNEP 2007b) based its baseline calculations on the growth rates developed in the SROC (average rate of 5.9%), but recognized that the SROC demand growth is relatively conservative (i.e., low growth compared to other assessments).

Exhibit 4: Historical Consumption of CFCs and HCFCs in Article 5 Countries (ODP-Weighted Tonnes)



Source: UNEP (2007c).

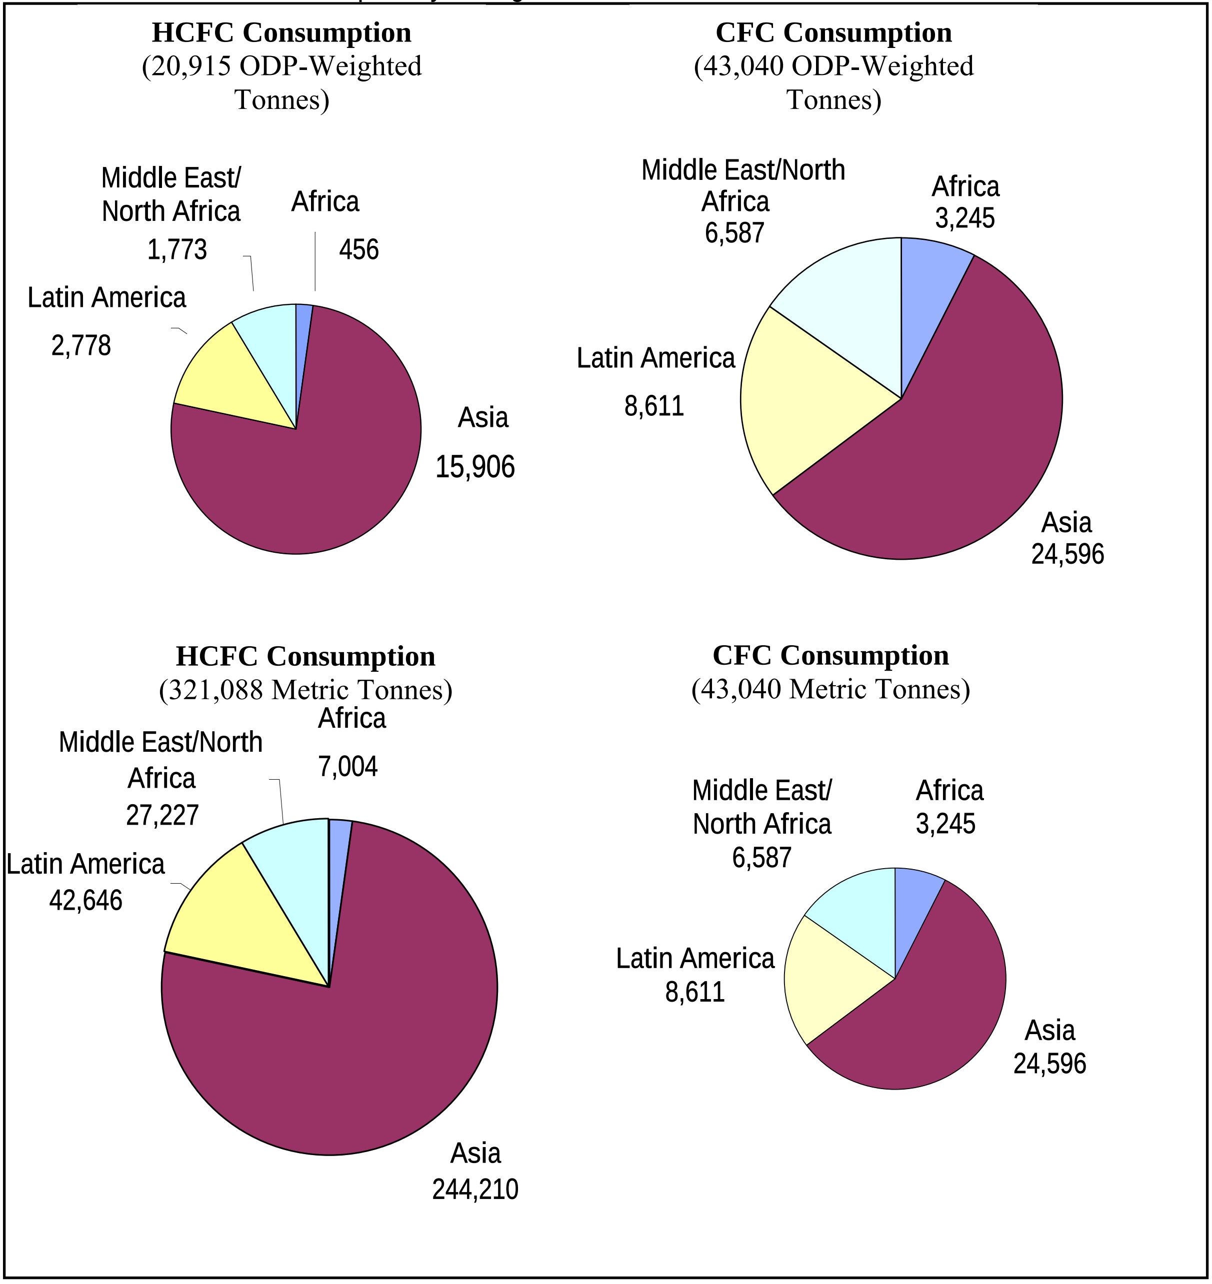
Exhibit 5: Historical Consumption of CFCs and HCFCs in Article 5 Countries (Metric Tonnes)



Source: UNEP (2007c).

While the transition to HCFCs is well underway in A5 countries, a look at current CFC and HCFC consumption figures in individual countries reveals different stages of transition. Some countries continue to rely heavily on CFCs, while others have transitioned away from them, now relying on HCFCs or other ODS alternatives (e.g., HFCs). Still other countries never relied heavily on CFCs, having purchased the majority of ODS-containing equipment later in time, when manufacturers had largely already transitioned to HCFCs. The comparison of CFC and HCFC consumption on a regional basis reveals that Asia, driven by China, is the largest consumer of both CFCs and HCFCs (see Exhibit 6).

Exhibit 6: HCFC and CFC Consumption by A5 Region in 2005



Source: UNEP (2007c).

On a country basis, as shown in Exhibit 7, China has the highest CFC consumption (30%) in A5 countries. Together with the Republic of Korea, Indonesia, Iran, and India, these countries represent over 50% of total A5 CFC consumption. China also dominates HCFC consumption, accounting for 55% of total A5 consumption. China and the five next largest A5 consuming countries—Korea, Mexico, Thailand, Brazil, and India—together represent over 80% of total HCFC consumption (see Exhibit 8). The fast-growing economies of China, Korea, and India, as well as their status as technology centers, help explain why these countries are such large consumers of both CFCs and HCFCs.

Exhibit 7: Top 20 CFC-Consuming A5 Countries in 2005

Rank	Country	ODP-Weighted Metric Tons	Percent of Total CFC 2005 Consumption
1	China	13,124	30%
2	Republic of Korea	2,730	6%
3	Indonesia	2,385	5%
4	Iran (Islamic Republic of)	2,221	5%
5	India	1,958	5%
6	Venezuela (Bolivarian Republic of)	1,842	4%

20	Venezuela	97	<1%
TOTAL Consumption of Top 20 A5 Countries		20,283	97%

Source: UNEP (2007c).

Because the use of ODS is being phased out under the Montreal Protocol, alternative refrigerants and technologies are being sought and brought to market. The alternatives, while ozone-friendly, are each associated with certain disadvantages. For example, HFCs have high global warming potentials (GWPs) and therefore contribute to climate change; carbon dioxide (CO_2) and ammonia can pose a human health hazard; and hydrocarbons (HCs) are a flammability risk. Of the HCFC alternatives currently in use, HFCs are the dominant market players. The most common HFCs used in the AC sector, as well as their GWPs, are presented in Exhibit 9.

Exhibit 9: GWPs and Application of Common HFCs in the Air Conditioning Sector[a]

Equipment Type	R-134a (GWP: 1,300)	R-407C (GWP: 1,525)	R-410A (GWP: 1,725)
Chillers	✓		✓
Window Units		✓	✓
Residential Unitary AC		✓	✓
Commercial Unitary AC		✓	✓
Water and Ground Source Heat Pumps	✓	✓	✓
Packaged Terminal Units	✓	✓	✓

[a] GWPs based on IPCC (1996).

R-134a chillers have been widely produced by manufacturers in A5 and non-A5 countries for both domestic and export markets. The use of R-407C and R-410A in AC applications is less mainstream, with producers in non-A5 countries adopting this technology relatively recently, in response to national HCFC phaseout requirements. A number of A5 producers have also begun using these HFC blends in newly produced AC equipment for export, to maintain market share in non-A5 countries.

Ultimately, however, regional refrigerant/technology choices are influenced by many factors, including local laws, regulations, standards, and economics. Ideally, in selecting ODS alternatives, climate-friendly options (i.e., CO_2, ammonia, and HCs) should be considered, though these options are currently rather limited in the air conditioning sector. Research suggests that not-yet-commercialized alternatives, including HC refrigerant blends, are being developed as next-generation alternatives to HCFCs.

The remainder of this report provides a more detailed look at current and future uses of CFCs, HCFCs, HFCs, and alternative refrigerants in air conditioning equipment in A5 countries.

3. Methodology Overview

This section summarizes the broad methodology used to develop this study.

As a first step, literature and internet research was conducted to identify reports and key industry players that could provide data on current and future stocks of chillers and air conditioning (AC) equipment in Article 5 countries, as well as estimated costs associated with this transition. Specifically, data were collected from a variety of sources, including:

- Industry publications, such as the 2007 Latin America Chiller Market report from the Building Services Research and Information Association (BSRIA), and Appliance Magazine.
- Published reports from the United Nations Environment Programme (UNEP),[3] the World Bank,[4] the United Nations Development Programme (UNDP),[5] GTZ,[6] the Intergovernmental Panel on Climate Change (IPCC),[7] and others.
- Selected project documents from the Executive Committee of the Multilateral Fund for the Implementation of the Montreal Protocol (MLF), including the African Fund for the Replacement of Chillers (AFROC) project report on the conversion of CFC chillers in five African countries.
- Selected technical presentations, such as those presented at the Stakeholder Meeting for the Implementation of UNEP Global Technical Assistance Programme in the Chiller Sub-Sector in New Delhi in October 2006, Open-ended Working Group of the Parties to the Montreal Protocol in Nairobi in June 2007 and the Stockholm Group meeting in Montreal in July 2007.

In addition, questionnaires were developed for key industry and government representatives (provided in Appendix I), and follow-up interviews were conducted. The following companies, trade associations, and government agencies were contacted:

- Bharat (India)
- Blue Star (India)
- Carrier (India, US)
- Danfoss (Denmark)
- Fujitsu (Japan)
- GTZ
- Haier (China)
- LG (Korea)
- Lennox (US)
- McQuay/Daikin (India, US)
- Mitsubishi (Japan)
- National Ozone Units from Brazil, China, India, Mexico, South Africa, South Korea, and Thailand
- ONIDA (India)
- Refrigeration and Air Conditioning Manufacturer's Association of India
- Samsung (Korea)
- Trane (US)

---

[3] UNEP (2004, 2007b, 2007d, 2007e).
[4] World Bank (2002, 2005).
[5] UNDP (2007).
[6] UNEP (2007a), GTZ (2006).
[7] IPCC/TEAP (2005).

- York (US)

Due to time constraints, not all contacts listed above were capable of providing input to this study. Significant information was collected from York, Carrier India and Carrier US, Trane, ONIDA, and the National Ozone Unit in South Africa. To avoid disclosure of any confidential business information, all industry information received through surveys, emails, and telephone queries conducted for the purposes of this study has been aggregated in this report. To the extent possible, estimates developed based on industry sources were substantiated against other available data (e.g., UNDP 2007, UNEP 2007a, BSRIA 2007).

Both qualitative and quantitative data were obtained from the above sources regarding current and future stocks of AC equipment, by equipment type. Specifically, estimates were developed for the following end uses:

- **Centrifugal chillers**: Centrifugal chillers are large, centralized air-conditioning systems commonly used in large buildings, such as offices, hotels, and factories. Chillers can range in cooling capacity from 350 kW to 30,000 kW, with an average refrigerant charge of about 0.33 kg/kW (UNEP 2004, ICF 2007). They also have very long lifetimes, up to 30 years or more (IPCC 2000, ICF 2007).

- **Positive Displacement chillers:** Positive displacement chillers are smaller than centrifugals, but are similarly used for cooling in buildings, offices, and large residential structures. They have average lifetimes of up to 25 years (ICF 2007).
  - ***Scroll***: Scroll chillers have a cooling capacity range of 7-1,600 kW with an average refrigerant charge of 0.28 kg/kW (UNEP 2004, ICF 2007).
  - ***Screw***: Screw chillers have a cooling capacity range of 140-2,275 kW with an average refrigerant charge of 0.28 kg/kW (UNEP 2004, ICF 2007).
  - ***Reciprocating***: Reciprocating chillers range in cooling capacity from 7 kW to 1,600 kW, with an average refrigerant charge of 0.35 kg/kW (UNEP 2004, ICF 2007).

- **Other Air Conditioners**: For the purpose of this study, other air conditioners include small self-contained AC units, non-ducted split residential and commercial units, and ducted split commercial and residential units (see text box below for additional description of the equipment types included). This analysis disaggregates this end use into “small” and “large” systems as follows:
  - ***Small AC:*** charge size of 0.75 - 3.5 kg.
  - ***Large AC:*** charge size of 7.5 -15 kg.

Self Contained Units

- *Window AC units*: fit into open windows or through walls; refrigerative coolers packaged into a single box that produces cool air on one side and rejects hot air on the other.
- *Packaged terminal AC/heat pumps*: used in small- and medium- sized low-rise buildings (e.g., offices, motels, barracks, and warehouses); units are typically installed in the wall, and are self-contained.

Ducted Split Systems

- *Unitary AC*: central AC systems used in houses and commercial applications; a compressor/heat exchanger unit outside the conditioned space supplies refrigerant to a heat exchanger, and the cooled/heated air is then supplied by a duct system.
- *Water and ground-source heat pumps*: use the earth and/or ground water as the sources of heat in the winter, and as the "sink" for heat removed from the building in the summer; common in office buildings, hotels, health care facilities, banks, schools, condominiums and apartments.

Non-Ducted Split Systems

- *Ductless AC*: used in residences; comprised of an outdoor condenser and an air handler.

For the purpose of this analysis, assumptions were developed regarding average charge size and lifetime for each of the equipment types listed above, as summarized in Exhibit 10.

Exhibit 10. Assumptions on Average Charge Size and Lifetime

Equipment Type	Assumed Average Charge Size (kg)	Assumed Average Lifetime (years)
Centrifugal Chillers	450	30
Screw Chillers	330	25
Scroll Chillers	150	25
Reciprocating Chillers	150	25
Large AC	10	15
Small AC	2	15

Source: ICF estimates based on UNEP (2004), Manikela (2007), IPCC (2000), World Bank (2002), ICF (2007), Stockholm Group (2007).

All information was used to develop an Excel-based model to "inventory" current and future stocks of equipment for four distinct A5 regions: (1) Asia, (2) Latin America and the Caribbean, (3) Middle East/North Africa, and (4) Africa. The following general methodological steps were followed to develop such an inventory:

- ***Step 1: Estimate Stock by Region.*** Number of units currently in use by region, including average charge size, were estimated based on UNEP reports, BSRIA (2007), Manikela (2007), and ICF (2007).

- ***Step 2: Disaggregate Stock by Refrigerant Type.*** Equipment was disaggregated by refrigerant based on data from UNEP reports, Manikela (2007), Stratus (2006), and industry information (ICF 2007).

- ***Step 3: Project Future Stocks.*** Market growth was projected in the short term (2007-2009) and long term (2010-2040) by equipment type and region based on industry insights on published market information (ICF 2007, Han 2007).

- ***Step 4: Project ODS Transition.*** The transition away from ODS was projected by retiring old equipment at a linear rate (based on equipment lifetime) and modifying the penetration of alternative refrigerants into new equipment based on anticipated market and regulatory trends. Specifically, in projecting the future penetration of refrigerants into new equipment, this analysis considered (a) the primary market players (i.e., A5 versus non-A5 equipment manufacturers), (b) the availability and cost effectiveness of ODS and substitute refrigerants, and (c) national and international regulations governing the use of ODS refrigerants. ICF estimates were developed based on input from industry, Manikela (2007), and UNEP reports.

A more detailed explanation of the assumptions, methodology, and sources used to develop current and future inventories of equipment and refrigerant by region is provided in chapters 4 and 5.

4. Chiller Sector

Chillers are centralized air conditioning systems used in medium and large buildings—including offices, hotels, shopping centers, and other large buildings—as well as in specialty applications on ships, submarines, nuclear power plants, and other industrial applications. Large chillers are generally installed in large cities and resort areas, primarily in temperate, hot-arid or hot humid climates (UNEP 2004, US EPA 2006). Chillers represent large investments and have a very long life of up to 30 years or more, particularly when maintained through proper service and occasional overhaul (ICF 2007, IPCC 2000, ARAP 2006, UNEP 2004).

Two broad types of chillers are manufactured—vapor compression chillers and absorption chillers. Vapor compression chillers are identified by the type of compressor they employ: centrifugal compressors or positive displacement compressors. The positive displacement category includes reciprocating, screw, and scroll compressors. Vapor compression chillers have historically relied on ODS refrigerants. Conversely, absorption chillers commonly use water or ammonia as the refrigerant (with lithium bromide or water as the absorbent, respectively). Because absorption chillers do not use ODS, the remainder of this chapter is focused only on centrifugal and positive displacement chillers.

Chillers may range in capacity from a few kilowatts (kW) to 30,000 kW, as shown in Exhibit 11. Centrifugal chillers are the most common type of chillers with a capacity greater than 700 kW. The use of CFCs in chillers has been limited to the large centrifugal machines in the range of 1,000 to 10,000 kW (IPCC/TEAP 2005, UNEP 2004)

Exhibit 11: Cooling Capacity Range Offered by Single Unit Chillers

Chiller Type	Capacity Range (kW)[a]	Average Refrigerant Charge (kg/kW)[b]
Centrifugal	350 - 30,000	0.33
Scroll and Reciprocating	7.0 - 1,600	0.28
Screw	140 - 6,000	0.35

Note: Many applications use multiple chillers to cool a particular space. For example, a large commercial office building may have 2 or more chillers.
[a] Source: UNEP (2004).
[b] Actual refrigerant charge varies slightly by refrigerant type; only average values are shown here.

Reciprocating compressors have been used in smaller chillers for many decades. Beginning in the mid-1980s, screw compressors became available as alternatives to reciprocating compressors in the capacity range from 140 - 700 kW, and as alternatives to centrifugal compressors up to about 2,275 kW. Scroll compressors were introduced around the same time, and have been used as alternatives to reciprocating compressors in the range from 7 to about 100 kW (UNEP 2007d). Because positive displacement chillers use higher-pressure refrigerants than centrifugal chillers, these smaller chillers never used CFC refrigerants, but have instead relied on HCFCs and, more recently, HFCs. (IPCC/TEAP 2005, UNEP 2004)

The remainder of this section examines the current market characteristics of centrifugal and positive displacement chillers, as well as available alternatives, and the projected transition away from ODS in this end use.

4.1 Market Characterization

4.1.1 Centrifugal Chillers

Centrifugal chillers have historically been manufactured primarily in the United States, with later production in Europe and more recent production in Asia (UNEP 2004). The major centrifugal chiller manufacturers are: Carrier (US), Daikin/McQuay (Japan), Trane (US), and York (US). Centrifugal chillers are also produced in Korea, China, and India; these A5 manufacturers supply an estimated

15%-20% of the A5 chiller market, while the remainder is satisfied by imports from non-A5 countries (ICF 2007). A more comprehensive listing of manufacturers is provided in Appendix 2.

Prior to 1993, centrifugal chillers were offered with CFC-11, CFC-113, CFC-12, CFC-114, R-500, and HCFC-22 refrigerants. CFC-12 was the dominant refrigerant used in high-pressure chillers, while CFC-11 was the dominant refrigerant for low-pressure chillers (IPCC/TEAP 2005). Combined, in 2004, these two refrigerants represented almost 100% of the installed CFC centrifugal chiller base (UNEP 2004). R-500, a blend containing CFC-12, was historically used in a limited number of centrifugal chillers, although very few are believed to be installed in A5 countries. Centrifugal chillers used in naval submarines and surface vessels historically employed neat CFC-114 as the refrigerant (IPCC/TEAP 2005).

With the signing of the Montreal Protocol, the four US-based manufacturers and their European affiliates discontinued the production of chillers using CFCs starting in 1993, which significantly limited production of new CFC chillers by the end of 1992, since these companies accounted for a large market share of production (US EPA 2005, UNEP 2004, UNEP 2007d).

Since the early 1990s, HCFCs and HFCs have been used primarily in new centrifugal chillers, though centrifugal chillers using HCFC-22 rarely were produced after the late 1990s, primarily because they were less efficient than HCFC-123 chillers at the time (Calm 2004, UNEP 2004). Since the 1990s, HCFC-123 and HFC-134a have become the dominant market players (US EPA 2005, UNEP 2007d). Centrifugal chillers produced for A5 markets by Carrier, Daikin/McQuay, and York contain HFC-134a, while those produced by Trane for A5 markets contain HCFC-123. A5 producers in Korea, China, and India produce chillers using both R-134a and R-123 (ICF 2007).

Based on available information, the current estimated stocks of centrifugal chillers by A5 region are presented in Exhibit 12.

Exhibit 12: Installed Base of Centrifugal Chillers by Region (2007)

Existing Stock	Asia	Latin America/ Caribbean	Middle East/ North Africa	Africa
Number of units in use	30,000	9,000	10,000	4,000

[a] ICF estimates based on BSRIA (2006), UNEP (2007d), ICF (2007).

The above estimates were developed based on the following data points:

- **Asia:** India has an estimated 6,000 centrifugal chillers currently installed (ICF 2007). China, which represents nearly 50% of the centrifugal chiller stocks in Asia (ICF 2007), reported had about 11,000 centrifugal chillers installed in 2004 (UNEP 2007d). Using an annual growth rate of 10.4% in China—China's GDP growth from 2005 to 2007—the current stock in China is estimated to be about 13,000. Based on this information, this analysis estimates centrifugal chiller stocks for the region to be 30,000.
- **Latin America/Caribbean:** According to industry experts, centrifugal chiller stocks in this region, excluding Mexico, are approximately 7,500 (ICF 2007). BSRIA (2007) reported that Mexico installed 79 new chillers in 2005. Assuming an average historical growth rate of approximately 3% per year over a 30-year period, the stock of chillers in Mexico is estimated at approximately 1,500 (BSRIA 2007, ICF estimates). Thus, 2007 estimated chiller stocks for the region are estimated at 9,000 (7,500 + 1,500).
- **Middle East/North Africa:** According to industry estimates, there are between 9,000 and 11,000 centrifugal chillers installed in the Middle East/North Africa today (ICF 2007). For the purposes of this analysis, the median value of 10,000 was assumed.
- **Africa:** According to industry estimates, there are between 3,000 and 5,000 centrifugal chillers installed in Africa today (ICF 2007). For the purposes of this analysis, the median value of 4,000 was assumed.

As shown in Exhibit 12, Asia has the largest installed base of centrifugal chillers. The Asian market is driven by China, with Korea and Taiwan also representing significant markets for centrifugal chillers in Asia (UNEP 2007d, ICF 2007). The centrifugal markets in China, Korea, and Taiwan are also significant on a global scale; according to market reports, China represented approximately 18% of global centrifugal chiller sales in 2004 (~1,500 chillers), while South Korea comprised approximately 4% (~400 chillers), and Taiwan represented 3.5% (~300 chillers) (BSRIA 2007, UNEP 2007d).

In Africa, South Africa is the most prominent user of centrifugal chillers, while the Middle East/North Africa region has its most significant chiller use in Saudi Arabia, Turkey, and the United Arab Emirates (ICF 2007). In Latin America, Mexico and Brazil are the largest users of centrifugal chillers, with about 80 new centrifugal chillers having entered the markets of both countries in 2005 (UNEP 2007d, BSRIA 2007).

Centrifugal chillers in Article 5 countries contain CFC-11, CFC-12, HCFC-123, HCFC-22, and HFC-134a as refrigerants. A small number of R-500 units may also be in operation. To disaggregate the regional stocks of centrifugal chillers by refrigerant type, ICF relied on individual country data to the extent possible.

Specifically, for Asia, 2004 data on the refrigerant composition of chiller stocks in China were used as proxies for the entire region (UNEP 2007d). To account for equipment retirement between years 2004 to 2007, CFC stocks were reduced by 1/18 (5.6%)[8] while the share of non-CFC refrigerants were grown by 10.4%—China's GDP growth rate from 2004 to 2007. Exhibit 13 presents the 2004 and 2007 refrigerant inventories in centrifugal chillers in China, used as proxies for all of Asia. It should be noted that, based on data on India's refrigerant inventory, the share of HFC-134a relative to HCFC-123 may be higher in China than in other A5 countries (ICF 2007).

Exhibit 13: Refrigerant Inventory in Centrifugal Chillers in China, Used as Proxies for All of Asia[a]

Refrigerant Type	Percent of Installed Base in 2004	Estimated Percent of Installed Base in 2007
CFCs	37%	27%
HCFC-123	29%	33%
HCFC-22	5%	6%
HFC-134a	29%	34%

Source: UNEP (2007d), ICF (2007).

For all other regions, data on refrigerant inventories was limited; only data on the number of CFC chillers were available for selected countries for 2004, as shown in Exhibit 14. In order to translate the 2004 CFC centrifugal stock estimates for these few countries into reasonable CFC stock estimates for their entire geographic regions, CFC stock estimates for these countries were first estimated for the year 2007 (by retiring CFC units at 5.6% or 1/18). Next, 1990 GDP values were used as proxies for scaling up total regional CFC chiller markets.[9] The results derived using this methodology (as presented in Exhibit 14) are supported by various other sources. For example, it has been estimated that between 600 and 1,000 large tonnage CFC chillers are in use in Africa (UNEP 2007a).

---

[8] Because production of CFC centrifugal chillers was phased out in 1995 and the assumed lifetime of a centrifugal chiller is 30 years, the number of CFC chillers is assumed to decline linearly to reach zero in 2025.

[9] GDPs from 1990 were used because the majority of CFC chillers were installed in Article 5 countries in the late 1980s and early 1990s (Kuijpers 2006); thus, 1990 is an approximation for the peak demand for CFC chillers in Article 5 countries.

Exhibit 14: CFC Chiller Stocks and Share of Regional GDP for Select A5 Countries

Region	Countries with Known CFC Chiller Stocks (2004)	Number of CFC Chillers in Selected Countries (2004)[a]	Estimated Number of CFC Chillers in Selected Countries (2007)	Percent of Region GDP Represented by Selected Countries, 1990	Total Estimated Number of CFC Chillers in Region (2007)[b]
Africa	Cameroon, Namibia, Sudan, Cote D'Ivoire, Nigeria	144	135	16.7%	810
Latin America/ Caribbean	Argentina, Brazil, Chile, Colombia, Ecuador, Jamaica, Mexico	3,990	3,390	86.7%	3,910
Middle East/ North Africa	Egypt	223	190	8.3%	2,290

[a] Sources: UNEP (2004)

[b] Regional estimates were calculated by growing CFC chiller stocks to account for the remaining GDP of region.

For example, for Latin America and the Caribbean, individual country data is available from UNEP (2004) on the 2004 CFC chiller stock in seven countries—Argentina, Brazil, Chile, Colombia, Ecuador, Jamaica, and Mexico—which was equal to approximately 3,990 chillers. After accounting for equipment retirement since 2004, it is estimated that these seven countries have about 3,390 CFC chillers in 2007 (ICF estimate). Because the aggregate share of these countries' 1990 GDP represents approximately 87% of the total GDP for the Latin America/Caribbean region, it was assumed that these seven countries hold approximately 87% of the region's centrifugal chillers. Accordingly, for 2007, it is estimated that the Latin America/Caribbean region as a whole has 3,910 CFC chillers.

Once the total number of CFC chillers by region was estimated, the percent of total regional chiller stocks (shown in Exhibit 12) that contain CFCs was calculated, and the remaining refrigerant inventory was apportioned based on China's estimated refrigerant breakout of non-CFC chillers, namely:

- HCFC-123: 46% of non-CFC centrifugal chiller stocks
- HFC-134a: 46% of non-CFC centrifugal chiller stocks
- HCFC-22: 8% of non-CFC centrifugal chiller stocks

While refrigerant inventories will of course vary by country, the above percentages are supported by data provided by the World Bank (2002), which indicate that the installed base of R-123 and R-134a in centrifugal chillers in Latin America are roughly equal. Thus, at a macro-level, this breakout is believed to be reasonable. At a country level, however, the actual installed base of R-123 versus R-134a may vary widely. For example, in South Africa, the vast majority of centrifugal chillers use R-134a, with R-123 chillers being very uncommon; conversely, in India, R-123 chillers account for an estimated 35-40% of the installed base, whereas R-134a only accounts for an estimated 20-25% (Manikela 2007, ICF 2007). Refrigerant preference at the national level depends in part on the dominant market players in the region (i.e., company presence/size of sales force).

The resulting refrigerant inventory, by percent of refrigerant, is shown by region in Exhibit 15. Because the manufacture of CFC chillers generally stopped in 1995, countries with a lower overall percent of installed CFCs were later entrants to the centrifugal chiller market.

Exhibit 15: Assumptions of Refrigerant Inventory in Centrifugal Chillers (2007)

Refrigerant Type	Asia	Latin America/ Caribbean	Middle East/ North Africa	Africa
CFCs[a]	27%	43%	23%	20%
HCFC-123	33%	26%	36%	37%
HCFC-22	6%	4%	6%	6%
HFC-134a	34%	26%	36%	37%

[a] CFC-11, CFC-12, R-500.

Exhibit 16 presents the corresponding estimates by stock (number of units by refrigerant and region).

Exhibit 16: Estimated Number of Centrifugal Chillers by Refrigerant Type (2007)

Refrigerant Type	Asia	Latin America/ Caribbean	Middle East/ North Africa	Africa	TOTAL
CFCs	8,240	3,910	2,290	810	15,250
HCFC-123	9,950	2,350	3,560	1,470	17,330
HCFC-22	1,710	390	590	250	2,940
HFC-134a	10,100	2,350	3,560	1,470	17,480

These estimates of CFC refrigerant inventory are supported by other published sources. According to GTZ (2006), there are an estimated 600 and 1,000 large tonnage CFC chillers installed in Africa. According to UNEP (2004), there were between 15,000 and 20,000 CFC chillers in A5 countries in 2004; therefore, it is reasonable that roughly 16,000 CFC chillers still remain in A5 countries in 2007. Similarly, according to the Alliance for Responsible Atmospheric Policy (2006), there are an estimated 50,000 remaining CFC chillers worldwide, and it is reasonable to assume that roughly 30% of these units are installed in Article 5 countries. No data are readily available to corroborate the stock estimates for HCFC and HFC centrifugal chillers.

4.1.2 Positive Displacement Chillers

Manufacturers of positive displacement chillers are located in Europe, the US, Japan, and Korea (World Bank 2005). The estimated number of positive displacement units currently installed in Article 5 countries is presented in Exhibit 17.

Exhibit 17: Installed Base of Positive Displacement Chillers by Region (2007)

Chiller Type/Attribute	Asia	Latin America and Caribbean	Middle East/ North Africa	Africa
Scroll & Screw	550,000	61,000	70,000	5,000
Reciprocating	40,000	12,000	10,000	500

These estimates of stocks were developed based on available market data and input from industry representatives, as outlined below:

- **Asia:** Based on industry information, there are an estimated 550,000 screw and scroll chillers in Asia—about 30% of which are installed in China—and approximately 40,000 reciprocating chillers—about two-thirds of which are installed in China. (ICF 2007)
- **Latin America/Caribbean:** BSRIA (2007) reported that the demand for new reciprocating, screw and scroll chillers was approximately 2,000 in 2005 in Brazil, Argentina, and Mexico. Assuming an average historical growth rate of 3% per year over a 30-year period, there were an estimated 39,000 scroll and screw chillers in these three countries in 2005. To account for market growth between 2005 and 2007, this stock was grown by 5.6% per year—the average GDP growth rate for these three countries from 2006-2007. Next, this 2007 stock estimate was grown further to account for the rest of the countries in the region, based on the most recent GDP values available (2006). Specifically, because Argentina, Brazil, and Mexico represented approximately 72% of regional GDP in 2006, it was assumed that these three countries account for approximately 72% of the scroll and screw chillers in the region.. Thus, it is estimated that there are approximately 61,000 scroll and screw chillers and 12,000 reciprocating chillers in this region. (ICF 2007)
- **Middle East/North Africa:** According to industry representatives contacted for this report, there are an estimated 70,000 scroll/screw chillers and approximately 10,000 reciprocating chillers installed in the Middle East/North Africa today (ICF 2007). No other data estimates were readily available for this region.

- **Africa:** According to industry estimates developed for this report, there are an estimated 5,000 scroll/screw chillers and 500 reciprocating chillers installed in Africa (ICF 2007). No other data estimates were readily available for this region.

As shown in Exhibit 17, Asia has the largest installed base of positive displacement chillers, comprising over 80% of the total stock in A5 countries. UNEP (2007d) reported that the majority of positive displacement chillers are used in Europe and Asia, with Malaysia, Thailand, Singapore, Indonesia, and the Philippines accounting for several hundred units. In Latin America, demand for new chillers using positive displacement compressors accounts for 3,200 to 3,300 units with around 6% increase in stock every year. (UNEP 2007d)

Screw chillers generally employed HCFC-22 as the refrigerant when they were first produced in the mid-1980s. The trend has been to replace HCFC-22 product offerings with HFC-134a products when manufacturers introduce new product lines. Screw chillers using a higher pressure HFC blend refrigerant, R-410A, also have been introduced recently, largely in Europe. A small number of screw chillers with ammonia as the refrigerant are produced by some manufacturers, used primarily in northern European countries. Before implementation of the Montreal Protocol, some of the smaller reciprocating chillers (<100 kW) were offered with CFC-12 as the refrigerant, but most of the smaller chillers and nearly all the larger chillers employed HCFC-22. (UNEP 2007d) There is little data available on the number of small (non-centrifugal) CFC chillers (<350 kW), particularly in A5 countries; however, generally, the majority of small chillers for comfort cooling use HCFC-22 (UNEP 2004). Positive displacement chillers are sold with HFCs and HFC blends (i.e., R-407C and R-410A) in non-A5 countries; it is assumed that R-407C and HFC-134a have begun to penetrate a small share of the A5 market, but that R-410A has not (ICF 2007, Manikela 2007). Exhibit 18 presents the estimated current stock of positive displacement chillers in Article 5 countries by refrigerant type. Based on this assumed refrigerant inventory, Exhibit 19 presents the number of positive displacement chillers in use by refrigerant type in each A5 region, based on the total stock identified in Exhibit 17.

Exhibit 18: Assumptions of Refrigerant Inventory in Positive Displacement Chillers (2007)

Chiller Type	Percent of Current Inventory
Scroll and Screw [a]	
HCFC-22	95%
HFC-134a	5%
Reciprocating	
HCFC-22	95%
HFC-134a	1%
R-407C	4%

[a] Current percent of installed R-410A and R-407C in scroll and screw chillers is negligible.
Source: ICF (2007).

Exhibit 19: Breakout of Current Positive Displacement Chiller Stock by Refrigerant Type

Chiller Type	Asia	Latin America/ Caribbean	Middle East/ North Africa	Africa
Scroll and Screw				
HCFC-22	522,500	57,950	66,500	4,750
HFC-134a	27,500	3,050	3,500	250
Reciprocating				
HCFC-22	38,000	11,400	9,500	475
HFC-407C	1,600	480	400	20
HFC-134a	400	120	100	5

Source: ICF (2007).

4.2 Alternatives and Barriers/Drivers to Implementation

The following table summarizes non-HCFC alternatives currently available in new chillers.

Exhibit 20: Availability of Non-HCFC Alternatives in New Chiller Equipment

Chiller Type	R-134a	R-245fa	R-407C	R-410A	HCs	Ammonia
Centrifugal	✓	✓[a]			✓[a]	
Screw	✓					
Scroll				✓		
Reciprocating	✓		✓		✓[a]	✓[a]

[a] Alternative has not measurably penetrated the global market.
Source: ICF (2007).

The remainder of this section describes these and other potentially feasible alternatives.

4.2.1 Centrifugal Chillers

For the relatively small centrifugal chiller segment, the primary refrigerant that has replaced the market segment formerly reliant on CFC-11 is HCFC-123, while the primary alternative that has replaced the original CFC-12, R-500, and CFC-114 chiller markets is HFC-134a (US EPA 2005). Until the use of HCFC or HFC refrigerants (e.g., R-123, R-134a) is no longer allowable, the costly redesign of new equipment and the cost of testing to ensure refrigerant reliability render it unlikely that manufacturers will pursue other alternatives to replace these refrigerants (UNEP 2007d). The current and potential future alternatives to ODS refrigerants that are/may be used in centrifugal applications are described in more detail below.

- **HFC-134a:** Currently, the primary alternative to HCFC-123 is HFC-134a (R-134a). This refrigerant has been used in centrifugal chillers since the early 1990s.

- **HFC-245fa:** Another alternative to replace the use of R-123 in new centrifugal chillers is R-245fa. Theoretical efficiency tests performed on R-245fa indicate that equipment using this refrigerant consumes a similar amount of energy as R-123 systems, but could have a higher cost due to the manufacturing processes entailed (Calm 2004). R-245fa is higher pressure than HCFC-123 and CFC-11 but lower than R-134a, and could be used as a potential alternative for R-134a in high-pressure chillers. However, to use it in new equipment, compressors and heat exchangers must be redesigned (IPCC/TEAP 2005). One small manufacturer in Japan (Ebara) has adopted this refrigerant already in chillers above 2,800 kW (UNEP 2007d, York 2007). This manufacturer has reported that R-245fa has favorable heat transfer characteristics exceeding those of HCFC-123 (York 2007). However, due to the limited and uncertain availability of HFC-245fa, it is unlikely that this refrigerant will become widely used in centrifugal chillers in the foreseeable future (ICF 2007).

- **Hydrocarbons:** Currently, hydrocarbon (HC) refrigerants, such as propane (R-290) and propylene (R-1270), are used in centrifugal chillers in petrochemical plants. However, due to the large charge sizes associated with centrifugal chillers, the flammability risk prevents HC centrifugal chillers from being used in any other applications.

Exhibit 21 summarizes the relative energy consumption and life cycle climate performance (LCCP)[10] of HCFC-22, R-123, R-134a, and R-245fa in centrifugal chillers. (Note that efficiencies of R-245fa are theoretical.) No information is available for HC chillers used in petrochemical plants.

[10] LCCP measures direct refrigerant emissions and indirect greenhouse gas emissions associated with energy consumption, accounting for cradle to grave emissions.

Exhibit 21: Relative Energy Consumption and LCCP of Alternative Refrigerants in Centrifugal Chillers

Alternative Refrigerant	Baseline	Energy Consumption[a] (Source)	LCCP (Source)
R-134a	HCFC-22	Similar (ADL 2002, Calm and Domanski 2004)	-10% (ADL 2002)
	R-123	+9% to +20% (Calm 2004)	Slight increase (Soffientini et al. undated)
R-245fa[b]	HCFC-22	-7% to -11% (ADL 2002)	-9% (ADL 2002)
	R-123	Similar (Calm 2004)	Slight increase (Soffientini et al. undated)

[a] Positive energy consumption indicates that the alternative refrigerant consumes more energy than the baseline refrigerant.
[b] Calculations performed were based on theoretical efficiencies.

Retrofits of existing stock of ODS centrifugal chillers are possible, though uncommon; such conversions are costly and typically result in efficiency losses or performance losses (i.e., lower cooling capacity). Moreover, by now, the conversion of most of the chillers that still have reasonable remaining operating life and relatively good energy efficiency have already been retrofit to use non-CFC refrigerants. Technically feasible retrofit options (which are not necessarily economically viable) are described below:

- CFC-11 centrifugal chillers may be retrofit to use HCFC-123. When performing such conversions, some non-metallic materials and hermetic motors must be replaced with compatible materials, and the compressor may need to be replaced with one that has a higher capacity. If the retrofit is done properly, there will only be a small reduction in capacity and a negligible reduction in energy efficiency. However, because retrofitting CFC-11 chillers to use HCFC-123 is technically difficult and is not always cost effective, replacing the chiller with a new unit may be a better investment (UNEP 2007d)

- CFC-12 and R-500 (which consists of CFC-12 and HFC-152a) centrifugal chillers may be retrofit to use HFC-134a. Such conversions may require compressor replacement (due to the need for higher impeller tip speeds) and/or the retubing of heat exchangers to minimize loss of capacity and efficiency. When converting from CFC-12 to R-134a, mineral oils must be replaced with polyolester oils and residual mineral oil concentrations must be minimized to prevent a reduction in heat exchanger performance. (UNEP 2007d),

- CFC-114 centrifugal chillers used in naval submarines and surface vessels can be retrofit to use HFC-236fa as a transitional refrigerant.[11] While a number of such conversions have been performed globally, such equipment is not common in Article 5 countries. (UNEP 2007d)

- HFC-134a and R-407C (a blend containing HFC-134a/HFC-125/HFC-32) are possible retrofit options for HCFC-22. However, switching to R-134a reduces cooling capacity by one third, unless the compressor is replaced with one that has 50 % greater displacement. Further, converting an HCFC-22 unit to R-407C or R-134a requires the removal and replacement of the mineral oil lubricant with a compatible synthetic lubricant. In addition, switching to R-407C results in loss of capacity and energy efficiency. (UNEP 2007d)

- R-427A (a new blend containing HFC-134a/HFC-125/HFC-32/HFC-143a) can be retrofit for R-22 equipment, requiring only the replacement of the system's original oil with a PolyOilEster (POE) lubricant. The performance of equipment retrofit to use R-427A is reportedly similar to that of R-22. However, because this refrigerant blend has a GWP of 1,830, it may not be a viable long-term solution. (Arkema 2006, BOC Gases 2007)

[11] No manufacturer has produced new chillers using HFC-236fa; new naval chillers primarily use HFC-134a (UNEP 2007d).

- Other potentially feasible retrofit candidates proposed for CFC-12 are R-416A and R-423a but they have yet to be fully investigated. Testing on R-416A (GWP ~975) has been done in motor vehicle air conditioning but the resulting reduction in cycle performance indicates that its performance in chillers will be less than CFC-12. R-423a (GWP ~2,400) is now being sold by one manufacturer and tests show that its coefficient of performance is almost equal to that of CFC-12, but it leads to reduced evaporator capacity. (UNEP 2004) Due to the high GWP of R-423a, it may not be a viable long-term solution.

Anecdotal information indicates that CFC replacements are occurring at a much slower pace in A5 countries than they are in non-A5 countries. This is in part because chillers in A5 countries are operated for as long as possible, and generally only replaced after a catastrophic failure, when servicing becomes uneconomical. (UNEP 2004)

While the conversion of old equipment may not be economically feasible, it should be emphasized that replacing old chillers with new ones, regardless of refrigerant type, will bring energy savings and climate benefits. Manufacturers offer HCFC and HFC chillers with significantly improved energy efficiency compared to most CFC chillers in service. The average new chiller is estimated to use approximately 20 % less electricity than the average chiller manufactured 20 years ago, with the most energy efficient chiller manufactured today requiring up to 65 % less electricity. These energy savings can lead to the recovery of the investment cost of replacing an old CFC chiller in three to five years or less (assuming the region requires cooling for more than three months a year). If the building's overall energy efficiency is improved along with the replacement of the chiller, the typical return on investment is 20% to 35%. This efficiency improvement results in indirect greenhouse gas emission reductions. (UNEP 2007d)

An additional climate benefit of replacing old CFC chillers is the reduction in refrigerant emissions. Newer HCFC and HFC chillers are typically more leak tight. Further, reduced refrigerant losses can also reduce operating costs (because the building owner will not have to purchase as much refrigerant and systems will cool more effectively with the proper amount of refrigerant charge, hence reducing energy requirements).

4.2.2 Positive Displacement Chillers

Historically, most positive displacement chillers have been manufactured with HCFC-22. As the HCFC phaseout advances in non-A5 countries, a number of HFC and other alternatives have been introduced. The development and adoption of these alternatives represent a significant opportunity for technological improvement, in the form of more leak-tight, efficient equipment. Each of the current and potential future alternatives that are or may be used in positive displacement chillers are described in more detail below.

- **HFC-134a:** R-134a is currently the primary replacement for HCFC-22 in all types of positive displacement chillers. However, R-134a requires larger compressor displacement than HCFC-22, which may initially result in higher prices for R-134a screw chillers. Market penetration is now such that the costs of HFC-134a screw chillers are similar to HCFC-22 screw chiller costs (UNEP 2007d).

- **R-410A:** This HFC blend (containing HFC-32 and HFC-125), with a GWP of 1,890, can be used in positive displacement chillers up to 350 kW capacity. It is currently used in newly manufactured scroll chillers. Because R-410A has a much higher pressure than HCFC-22, system components must be redesigned to meet pressure safety codes. The required redesign is costly and requires significant financial investments. However, using R-410A enables a reduction in refrigerant charge (up to 40% less than an HCFC-22 system) for a particular cooling capacity and leads to improved heat exchanger performance, enabling a reduction in heat exchanger sizes (UNEP 2007d). The cost of R-410A is expected to be somewhat higher than that of HCFC-22 refrigerant, at least in the near-term, as discussed in more detail in Appendix 1, which will render equipment containing R-410A more costly. In addition, the high GWP of this refrigerant may undermine its long-term viability.

- **R-407C:** This HFC blend, with GWP of 1,610, is offered in reciprocating chillers from a number of manufacturers, largely used as an intermediate option in the transition to R-410A or R-134a. In general, only minor changes in design are required to switch equipment from HCFC-22 to R-407C. For example, to maintain performance, R-407C requires the use of larger heat exchangers (due to changes in heat transfer capability), which are more expensive. (UNEP 2006, 2007d)

- **HFC-32:** R-32 is a potential alternative to HCFC-22 that has not yet been commercialized. However, it has operating pressures higher than HCFC-22 and is flammable so would require significant additional research and development to become a market player. (UNEP 2007d)

- **Hydrocarbons (HCs):** Although hydrocarbons have not measurably penetrated the global market, several new reciprocating chillers have been manufactured using R-290 (propane) and R-1270 (propylene) in Europe. Safety guidelines limit the charge size of HC positive displacement chillers, depending on application, and require protective measures to be taken, including proper placement and/or gas tight enclosure of the chiller, use of a low-charge system design, fail-safe ventilation systems, and gas detector alarm systems. Alternatively, HC chillers may be located outdoors to minimize health risks (IPCC/TEAP 2005). The safety concerns that limit the marketability of chillers using hydrocarbons results in a higher cost for HC chillers. (IPCC/TEAP 2005, UNEP 2007d)

- **Ammonia:** A very small number of water-cooled reciprocating chillers were manufactured with ammonia as refrigerant but ammonia has not yet significantly penetrated the market (UNEP 2007d). Ammonia can also be used in open drive screw chillers (200-1,500 kW, 50-400 tons), provided that safety issues are addressed (ADL 2002).

There is little information on the energy efficiency of alternative refrigerants relative to CFCs and HCFC-22; however, some calculations indicate that alternatives may be slightly more efficient than refrigerants used historically. Exhibit 22 summarizes the relative energy consumption and LCCP of actual and potential alternative refrigerants in positive displacement chillers, based on published data.

Exhibit 22: Relative Energy Consumption and LCCP of Alternative Refrigerants in Positive Displacement Chillers

Alternative Refrigerant	Baseline	Energy Consumption[a] (Source)	LCCP (Source)
Screw Chillers			
R-134a	CFC-12		Less (UNEP 2007d)
	HCFC-22	-	+ 6% (ADL 2002)
R-410A	HCFC-22	-	Similar (IPCC/TEAP 2005)
Ammonia	HCFC-22	Same (Sand et al. 1997)	Slight increase (IPCC/TEAP 2005)
	R-134a	Same (Sand et al. 1997)	-
Scroll Chillers			
R-407C	R-290	-	Similar (IPCC/TEAP 2005)
Reciprocating Chillers			
R-290	HCFC-22	-5% (IPCC/TEAP 2005)	-
	R-407C	-	Similar (IPCC/TEAP 2005)

\- = No information available

[a] Positive energy consumption indicates that the alternative refrigerant consumes more energy than the baseline refrigerant.

While retrofits of positive displacement chillers may be technically possible, they are typically not economically feasible. In general, it costs less to purchase a new R-410A scroll chiller than to convert an existing HCFC-22 unit to use R-410A (ICF 2007). Similarly, it costs less to purchase a new R-134a screw chiller than to convert an existing HCFC-22 unit to use R-134a (ICF 2007). Technically feasible retrofit options are described below:

- The most common replacement for CFC-12 is HCF-134a, due to their similarities in operating pressure levels and cooling capacities. (UNEP 2007d)

- HCFC-22 is most often replaced with R-407C, R-417A, or HFC-134a, all of which are compatible. HCFC-22 may also be replaced by R-404A or R-507A, which are more suitable as replacements for R-502, but no superior substitute has emerged. (UNEP 2007d)

4.3 Projected Transitions

4.3.1 Centrifugal Chillers

The majority of ODS will be phased out of chillers not through retrofit activity, but through eventual replacement, once old units reach retirement. To project how the equipment stock and refrigerant inventory in centrifugal chillers will change over time, this analysis models the retirement of old equipment and the phase-in of new units through 2040; no significant number of retrofits are assumed to occur in the future, assuming the current regulatory regime is maintained. Because CFC production was phased out in 1995 and the assumed lifetime of a centrifugal chiller is 30 years, the number of CFC chillers in all regions declines linearly to reach zero in 2025 at a retirement rate of 1/30 or 3.3% per year).

Meanwhile, as older CFC chillers are phased out, new chillers are added according to their market share of sales in that year. Exhibit 23 summarizes the projected overall market growth of centrifugal chillers by region, based on input from industry sources. As indicated, China and the Middle East/North Africa are expected to maintain high growth rates in the short run, but growth in all regions is expected to slow between 2010 and 2040, as economic growth stabilizes and the market becomes saturated (ICF 2007).

Exhibit 23: Projected Market Growth for Centrifugal Chillers by Region

Timeframe	Asia		Latin America/ Caribbean	Middle East/ North Africa	Africa
	China	All Others			
2007-2009	10.0%	6.5%	6.5%	10.5%	4.5%
2010-2040	5.0%	3.3%	5.0%	5.3%	4.0%

Source: ICF (2007).

Current and future equipment sales by refrigerant type were projected through 2040. Assumptions used in developing these projections are as follows:

- Current (2007) market penetration of refrigerants into new equipment sales are assumed to be: 75% R-134a, 24% R-123, and 1% R-22. These market penetration rates are projected to remain constant until 2010.

- In 2010, use of R-22 in new centrifugal chillers is assumed to stop in 2010, with R-123 taking its place. From 2010 to 2040, the choice of refrigerant used in new equipment sold in A5 countries is projected to stay constant, with R-134a accounting for 75% of the market and R-123 accounting for the remaining 25%. While it is unlikely that actual market trends will remain constant for 30 years, this analysis does not attempt to project whether demand for R-123 chillers in A5 markets will increase or decrease in future.

Applying these assumptions regarding equipment retirement, market growth, and anticipated penetration of refrigerants into new equipment, Exhibit 24 and Exhibit 25 graphically present the projected refrigerant bank in centrifugal chiller equipment across all A5 regions. More detailed results on the estimated stocks by refrigerant and region are presented in Appendix 3.

Exhibit 24: Projected Transition of Refrigerant Bank in Centrifugal Chillers in A5 Countries, 2007-2040

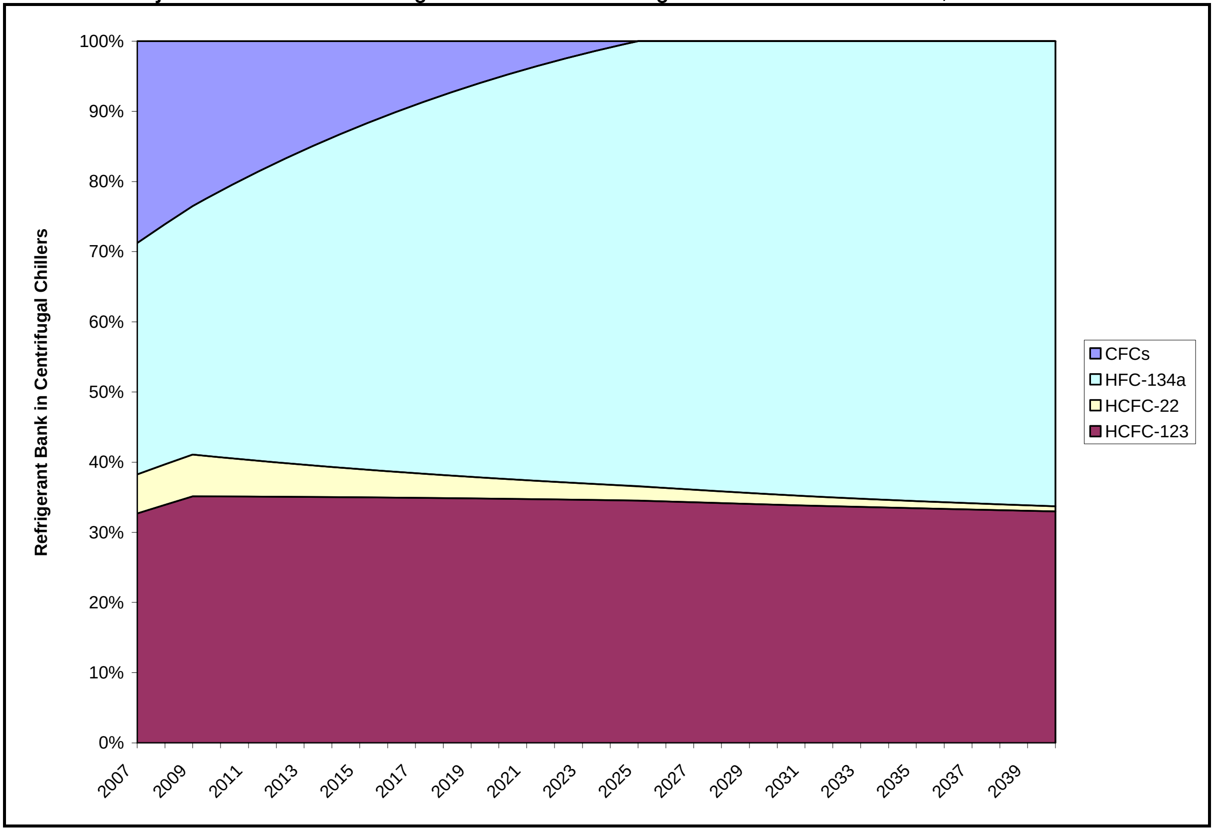

Exhibit 25: Projected Transition of Refrigerant Bank in Centrifugal Chillers in A5 Countries (2007 – 2040)

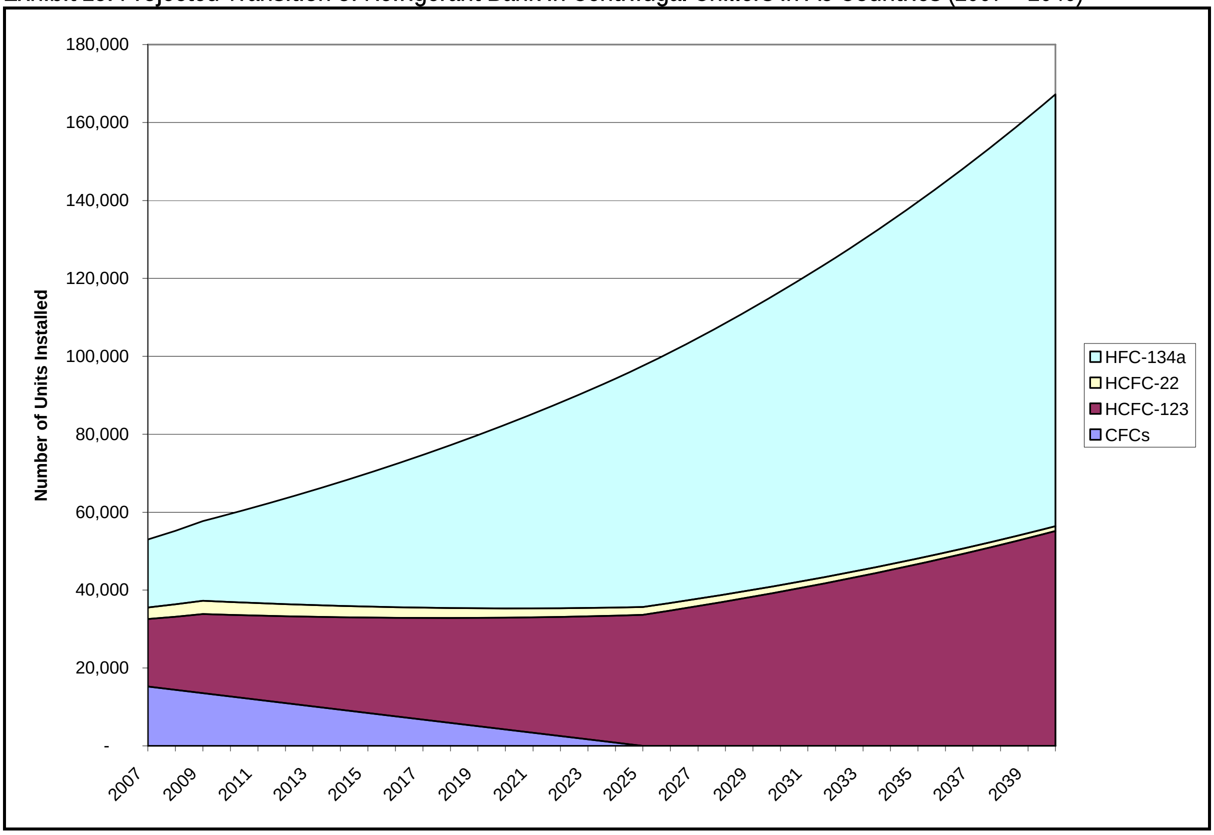

4.3.2 Positive Displacement Chillers

The market share of screw and scroll chillers is expected to increase due to compactness of the units, maintainability, and ease of operation (World Bank 2005). Indeed, most of the volume increase in the positive displacement chiller market is moving to scroll and screw compressors, while markets for reciprocating chillers are decreasing (UNEP 2007, ICF 2007).

On a global scale, HFC-134a now accounts for approximately 15-20% of all positive displacement chiller sales, and will become the dominant refrigerant by 2020 as HCFC-22 is phased out. Specifically, it is projected that HFC-134a will comprise 80% of the new screw chiller market, 20% of the new scroll chiller market, and 100% of the new reciprocating chiller market, globally. After R-134a, R-410A will be the leading replacement for HCFC-22, especially in scroll chillers. However, without the need to phaseout HCFCs in the near future, A5 producers are likely to continue to rely on R-22 longer than producers in non-A5 countries; therefore, the transition away from ODS in A5 counties will be slower than in non-A5 countries. One exception to this will be A5 manufacturers that produce for export to non-A5 markets; such manufacturers will be required to transition away from ODS in order to maintain their market share.

To project how the equipment stock and refrigerant inventory in positive displacement chillers will change over time, this analysis modeled the retirement of old equipment and the phase-in of new units through 2040. Based on an assumed lifetime of 25 years, positive displacement chillers are retired at a rate of 4% (1/25) per year. It is assumed that no significant number of retrofits will occur in future under a business-as-usual scenario. Meanwhile, as the old chillers phase out, new chillers are added according to their market share of sales in that year. Exhibit 26 summarizes the projected market growth of positive displacement chillers by region, based on industry input. (ICF 2007).

Exhibit 26: Projected Market Growth of Positive Displacement Chillers by Region

Timeframe	Asia		Latin America/ Caribbean	Middle East/ North Africa	Africa
	China	All Others			
Screw & Scroll					
2007-2009	10.0%	6.5%	6.0%	5.5%	4.0%
2010-2040	5.0%	3.3%	5.0%	2.8%	4.0%
Reciprocating					
2007-2009	2.0%	1.3%	1.2%	1.1%	0.8%
2010-2040	0%	0%	0%	0%	0%

As presented, it is projected that the market growth for reciprocating chillers will be 0% in the long-term (beyond 2010), as market trends and industry representatives suggest that this equipment type is becoming obsolete. While this may not be the case in all A5 countries, it is assumed that overall sales of these units in the long-term will be negligible across A5 regions. Meanwhile, growth for screw and scroll chillers will be high. In fact, due to lack of market saturation and high growth potential in China, Africa, and Latin America/Caribbean, growth for screw and scroll chillers is projected to remain relatively high through 2040. For Asia and the Middle East, which have a higher rate of saturation, long term growth rates are projected to decline by 50% between 2010 and 2040, relative to short term growth rates. (ICF 2007).

Based on information provided by industry representatives, current and future market penetration rates by refrigerant type into new positive displacement chiller sales were projected through 2040. Assumptions used in developing these projections are as follows:

- Current (2007) market penetration of refrigerants into new equipment sales are assumed to be as follows:
  - Screw: 70% R-22, 30% R-134a
  - Scroll: 80% R-22, 10% R-134a, 10% R-410A
  - Reciprocating: 85% R-22, 10% R-407C, 5% R-134a

- Estimated 2007 market penetration rates of refrigerant into new equipment are projected to remain constant until 2010.
- In 2010, it is assumed that no new manufacture of reciprocating chillers occurs. For scroll and screw chillers, it is assumed that a shift away from HCFCs takes hold in response to the HCFC phaseout in non-A5 countries. While not all positive displacement chillers entering A5 markets are produced in non-A5 countries, the phaseout will influence the choice of refrigerants being offered in chiller equipment worldwide. Specifically, it is assumed that from 2010 to 2020, the market will gradually shift to the following make-up:
  - — Screw: 20% R-22, 80% R-134a
  - — Scroll: 30% R-22, 20% R-134a, 50% R-410A
- The choice of refrigerant used in new equipment sold in A5 countries is projected to stay constant from 2020 to 2040.

Applying these assumptions regarding equipment retirement, market growth, and anticipated penetration of refrigerants into new equipment, Exhibit 27 illustrates the total A5 projected refrigerant bank in positive displacement chillers through 2040. Exhibit 28 and Exhibit 29 present the total A5 projected refrigerant stock of scroll/screw and reciprocating chillers, respectively. More detailed results on the estimated stocks by equipment type and region are presented in Appendix 3.

Exhibit 27: Positive Displacement Chiller Stock in Article 5 Countries by Refrigerant, 2007-2040

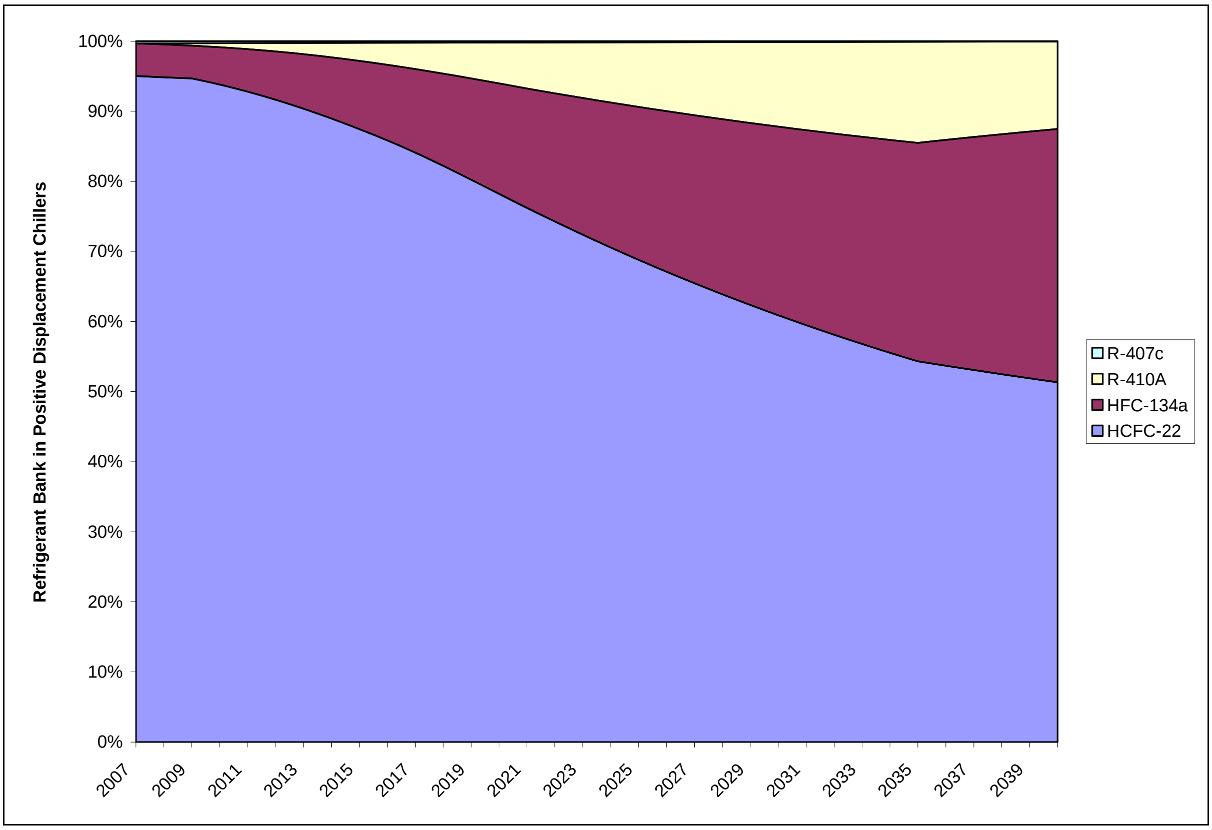

Exhibit 28: Projected Transition of Refrigerant Stock in Screw & Scroll Chillers in A5 Countries (2007 – 2040)

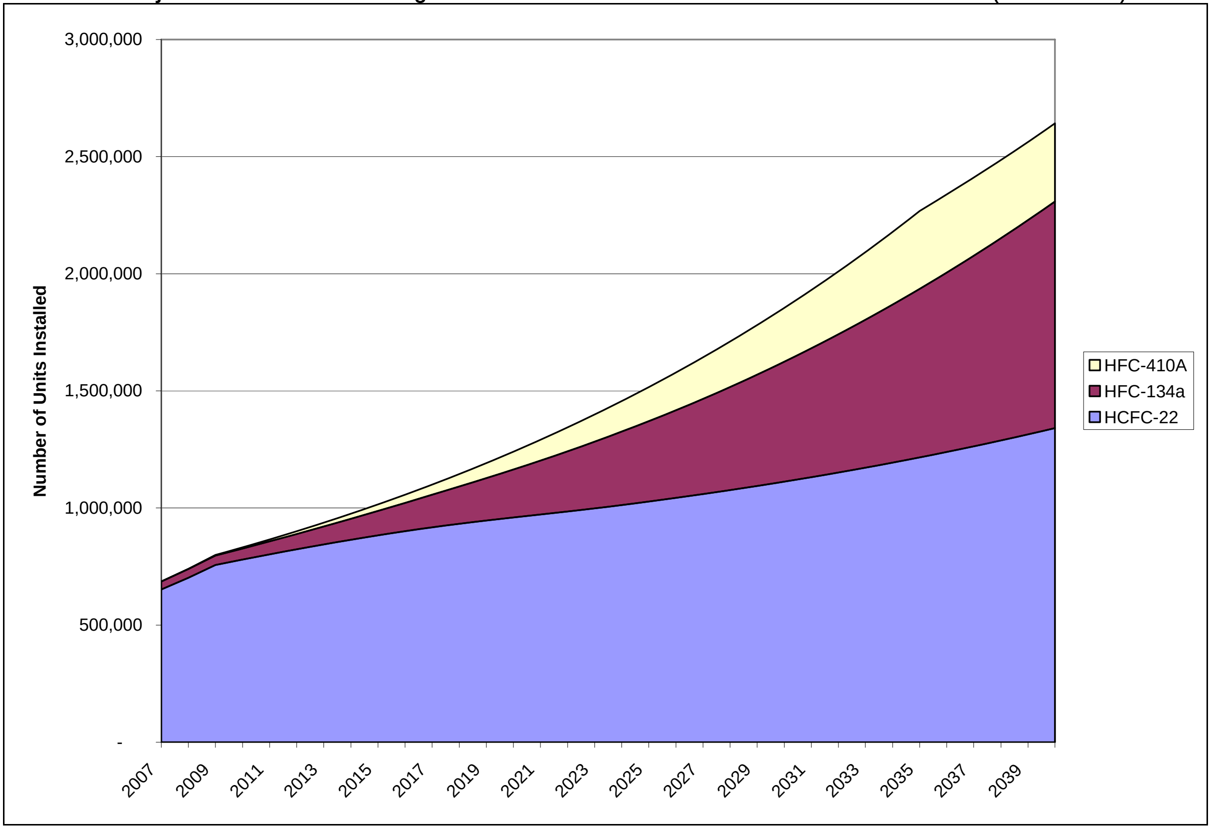

Exhibit 29: Projected Transition of Refrigerant Stock in Reciprocating Chillers in A5 Countries (2007 – 2040)

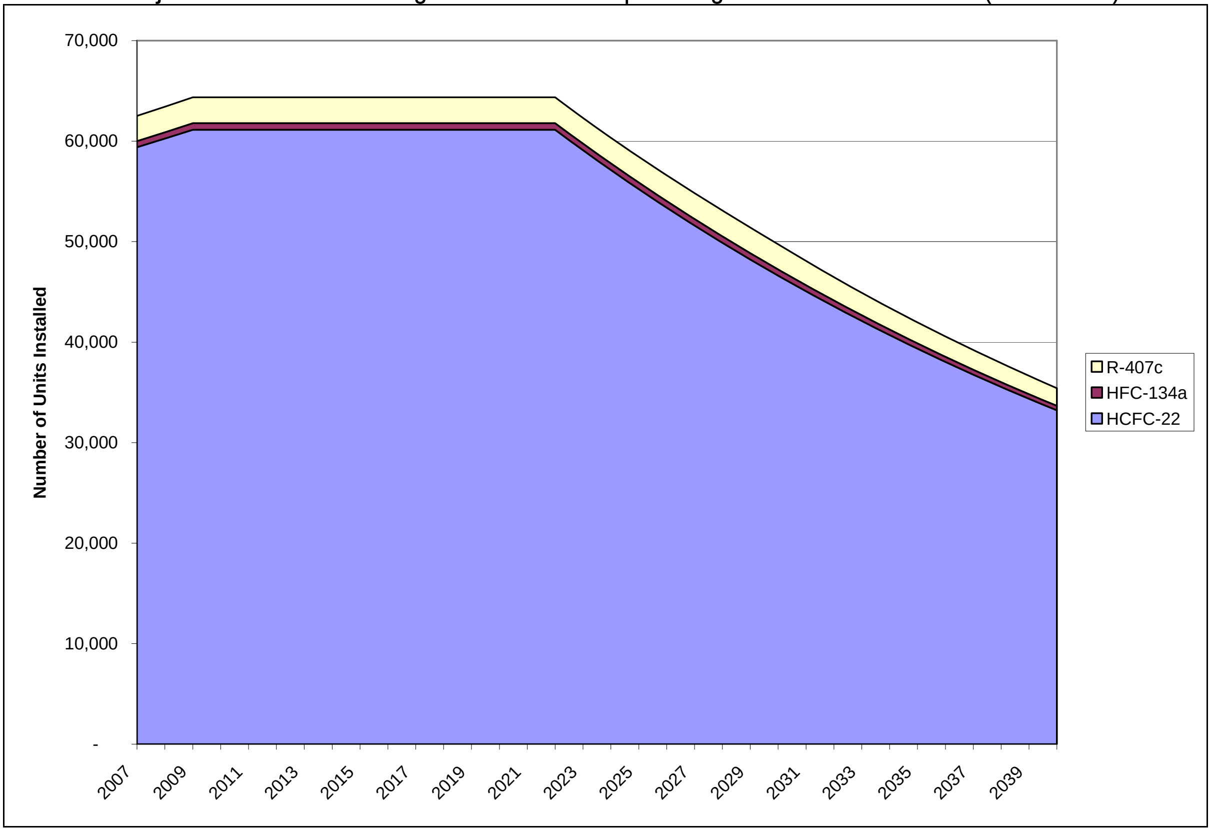

Note: the decline in banked refrigerant starting in 2023 represents the phaseout of equipment, as no new reciprocating chillers are assumed to be sold after 2009. The net stock of R-22 units begins to decline in 2023, while those of R-134a and R-407C begin to decline in 2030 (assuming an equipment lifetime of 30 years and that R-22 units began production in 1993 and R-134a/R-410A units began production in 2000).

5. Small and Large Air Conditioning Sector

Small and large air conditioners comprise the vast majority of the global air conditioning market (UNEP 2007d). These systems cool enclosed spaces ranging from single rooms to large exhibition halls. Most are electrically-driven vapor-compression systems where air is drawn over a coil containing evaporating refrigerant. They generally fall into the following four categories:

- **Small self contained air conditioners:** These include small window-mounted, portable, and through-the-wall air conditioners. Due to their small size and relatively low cost, these are quite popular in Article 5 countries and are used in small shops and offices, as well as private residences. They range in capacity from 1.0 kW to 10.5 kW and have an average charge size of 0.75 kg or 0.25 kg per kW of cooling capacity (UNEP 2007d, IPCC/TEAP 2005)**.**

- **Non-ducted or duct-free split air conditioners:** Non-ducted split air conditioners include a compressor/heat exchanger unit installed outside the space to be cooled or heated. The outdoor unit is connected via refrigerant piping to one (‘single-split’) or more (‘multi-split’) indoor units (fan coils) located inside the air conditioned space. These have become increasingly popular in Article 5 countries as entry-level ACs, especially in Asia for residential and light commercial applications (e.g., in schools, large apartments and free-standing residences). Capacities range from 2−28 kW for a single split, and from 4.5−135 kW for a multi-split system; charge sizes average about 1.28 kg or approximately 0.25 to 0.30 kg per kW of cooling capacity. (UNEP 2007d, IPCC/TEAP 2005).

  A sub-category of non-ducted multi-split systems gaining ground in Article 5 countries are Variable Refrigerant Flow (VRF) systems. These systems provide air conditioning to multiple spaces using a single outdoor unit and multiple indoor units. VRF systems can regulate refrigerant flow in response to system demand and their capacities range from 10 kW to over 130 kW (UNEP 2007d).

- **Ducted split residential air conditioners:** Ducted split residential air conditioners have a duct system that supplies cooled or heated air to each room of a residence or individual zones within commercial or institutional buildings. Ducted systems are predominantly used in non-Article 5 countries; their capacities range from 2−20 kW, with corresponding charge sizes ranging from 0.26 to 0.35 kg per kW of capacity. (UNEP 2007d, IPCC/TEAP 2005).

- **Ducted split commercial air conditioners:** Ducted commercial air conditioners range in capacity from about 5 kW to as large as 420 kW. The majority of ducted, commercial split and single package air conditioners are mounted on the roof of buildings (e.g.., offices, retail stores and restaurants), or on the ground adjacent to the building. These can range in capacity from 5 to 420 kW (UNEP 2007d, IPCC/TEAP 2005).

Given that these types of residential and commercial AC equipment can range significantly in charge size, this analysis models a “small” and a “large” end use. Small AC is assumed to have an average charge size of 2 kg; large AC is assumed to have an average charge size of 11 kg (UNEP 2007d, IPCC/TEAP 2005). Equipment in this sector is assumed to have an average life span of 15 years (US EPA 2006).

The remainder of this section explores the market characteristics and refrigerants in use in this sector, as well as the projected transition away from ODS.

5.1 Market Characterization

According to industry sources there are hundreds of manufacturers of small and large AC equipment around the world (ICF 2007). China is the largest Article 5 manufacturer of AC equipment, with its total production having reached 67.6 million units in 2005 (UNEP 2007a). In 2006, China’s production of central AC equipment alone increased 20% over 2005, worth a total value of US$1.3

billion (Han 2005). In 2005, the top 10 brands in China accounted for about 75% of the domestic market (with Haier, Midea, and Gree alone representing nearly 40%), while the 29 smallest brands each accounted for less than 0.01%. Foreign and joint venture brands in China accounted for roughly 27% of the market (China Daily 2005).

A significant share of China's production is for the export market. From August 2004 to July 2005, China exported nearly 24.68 million AC units (China Daily 2005). China supplies nearly 85% of the window, wall, and mini split AC imports to the United States. Other A5 producers are also important exporters; including South Korea, Thailand, Brazil, and Mexico. While non-A5 countries are small players in this global market, Canada, Germany, Italy, the United States, Israel, and others produce AC equipment for domestic and export markets. (Stratus 2006).

According to UNEP (2007), there were an estimated 478 million small window-mounted and wall air conditioning systems installed globally in 2004, of which 92.3% (or 441,194,000) used ODS refrigerants (UNEP 2007d). The same report estimates that a total of 21 million large AC systems were installed worldwide in 2004. According to UNEP (2005), 75% of AC units are installed in non-Article 5 countries. Thus, this analysis estimates that 25% of global AC units are installed in A5 countries (i.e., 108,842,000 small AC units, and 5,180,000 large AC units in 2004). To estimate current (2007) stocks of AC units, 2004 estimates were grown based on annual growth rates of 9% and 7% for small and large AC equipment, respectively,[12] and A5 stocks were then disaggregated by region based on average GDPs from 1992-2006. Exhibit 30 presents the number of small and large AC units currently installed by A5 region.

Exhibit 30: Installed Base and Average Charge Size of Small and Large AC by Region (2007)[a]

AC Type/ Attribute	Asia	Latin America/ Caribbean	Middle East/ North Africa	Africa
Small AC				
Number of units in use	86,446,200	30,177,700	12,938,900	12,168,400
Large AC				
Number of units in use	3,892,700	1,358,900	582,600	547,900

[a] ICF estimates based on UNEP (2007, 2005), ICF (2007).

The majority of Article 5 countries are still using HCFC-22 to produce AC products for their domestic markets (UNEP 2007d). According to various reports and industry sources, virtually the entire installed base of AC equipment in Article 5 countries contains HCFC-22 refrigerant (ICF 2007, UNEP 2007d, Stockholm Group 2007, Stratus 2006). However, some Article 5 countries do have access to HFC equipment, and such equipment has begun to penetrate A5 markets. For example, there were an estimated 100,000 R-407C AC units and 300,000 R-410A AC units in China in 2003 (UNEP 2007a). It is believed that much of the HFC-containing AC equipment penetrating the Chinese market is for "trophy projects," where "green" products are sought, such as for new facilities being constructed for the Olympics (ICF 2007). Likewise, an estimated 5% of new AC equipment entering the market in South Africa contains R-410A, which is imported from Europe (Manikela 2007).

To estimate the current (2007) AC equipment stock that contains HFC refrigerants, China's 2003 stock estimates of R-407C and R-410A were grown at an annual rate of 5% per year.[13] These stock estimates were translated into share of current refrigerant inventory contained in AC equipment, assuming that China holds 50% of the AC units installed today in A5 countries in Asia (UNEP 2007a, ICF 2007). Based on this methodology, it is estimated that R-410A comprises 0.75% of the current stock of small and large AC units, while R-407C comprises 0.25% (see Exhibit 31). These percentages were assumed to apply to all Article 5 regions. Based on these estimates, Exhibit 32 presents the number of small and large AC units by refrigerant type currently installed by A5 region.

---

[12] This growth rate is the weighted average projected market growth rates for A5 regions from 2007-2010, as shown in Exhibit 34.

[13] This growth rate is half of the projected market growth rate for AC equipment in Asia from 2007-2010, as shown in Exhibit 34; it is reflective of the fact that demand for HFCs (e.g., for "trophy projects") is growing, but not in step with the overall market.

Exhibit 31: Current Refrigerant Inventory in AC Units by Region[a]

AC Type	Asia	Latin America/ Caribbean	Middle East/ North Africa	Africa
Small AC				
R-22	99%	99%	99%	99%
R-410A	0.75%	0.75%	0.75%	0.75%
R-407C	0.25%	0.25%	0.25%	0.25%
Large AC				
R-22	99%	99%	99%	99%
R-410A	0.75%	0.75%	0.75%	0.75%
R-407C	0.25%	0.25%	0.25%	0.25%

[a] ICF estimates based on UNEP (2007a), ICF (2007).

Exhibit 32: Installed Base of Small and Large AC Equipment by Refrigerant and Region (2007)[a]

AC Type	Asia	Latin America/ Caribbean	Middle East/ North Africa	Africa
Small AC				
R-22	85,581,700	29,875,900	12,809,500	12,046,700
R-410A	648,300	226,300	97,000	91,300

R-410A	29,200	10,200	4,400	4,110
R-407C	9,700	3,400	1,500	1,370

[a] ICF estimates based on UNEP (2007d), Manikela (2007), ICF (2007).

5.2 Alternatives and Barriers/Drivers to Implementation

As mentioned earlier, almost all of the small and large AC equipment manufactured in Article 5 countries uses HCFC-22. Currently, the only feasible alternatives for such equipment are HFCs, primarily R-410A and R-407C (IPCC/TEAP 2005, Calm and Domanski 2004). However, R-410A operates more efficiently than R-407C and globally, already accounts for approximately 10 percent of residential and small commercial AC sales, up from just 5 percent in 2004 (ICF 2007).

In the future, other alternatives may also become market players. R-417A is feasible for use in both new and existing unitary AC units, but has a high GWP (DuPont 2006). CO_2 and HCs (e.g., propane) may also one day be feasible, but extensive research and development is still needed to design systems to address potential safety hazards (CIAA/ECSLA/EuroCommerce 2005, IPCC/TEAP 2005). However, these are unlikely to significantly displace R-410A unless regulations are introduced that require a shift away from R-410A.

Each of the current and potential future alternatives that are/may be used in AC applications are described in more detail below.

- **R-410A:** R-410A, with a GWP of 1,890, is a binary blend (HFC-32/HFC-125) that can replace HCFC-22 in new equipment production. R-410A air conditioners (up to 175 kW) are commercially available in the U.S., Asia, and Europe. A significant portion of the duct-free products manufactured in Japan and Europe now use R-410A as the preferred refrigerant. After 2010, air conditioners sold in the U.S. market will predominately utilize R-410A as the HCFC-22 replacement. This blend results in system pressures approximately 50 percent higher than with HCFC-22. However this has been addressed by implementing design changes such as heavier wall compressor shells, pressure vessels (accumulators, receivers, filter driers), heat exchangers and refrigerant tubing (UNEP 2007d).

- **R-407C:** R-407C, with a GWP of 1,610, is a blend composed of HFC-32, HFC-125, and HFC-134a. There are currently R-407C air conditioning products widely available in Europe, Japan and other parts of Asia. R-407C has also seen some limited usage in the United States and Canada, primarily in commercial applications. R-407C requires only modest modifications to existing HCFC-22 systems and is sometimes used for retrofits of air conditioning equipment. Performance tests with R-407C indicate that in properly designed air conditioners, this refrigerant will have capacities and efficiencies within ±5% of equivalent HCFC-22 systems. However, many of these products are now beginning to transition from R-407C to R-410A to obtain improved serviceability and higher efficiencies. (UNEP 2007d).

- **HFC-134a:** R-134a is the only single component HFC that has seen any commercial application. However, R-134a is not a drop-in replacement for HCFC-22 since the compressor displacement must be increased approximately 40 percent to compensate for the lower refrigeration capacity of R-134a. Significant equipment redesign is necessary to achieve efficiency and capacity equivalent to HCFC-22 systems. These design changes include larger heat exchangers, larger diameter interconnecting refrigerant tubing, and re-sized compressor motors. R-134a has not seen broad use because manufacturers have been able to develop lower cost air conditioning systems using HFC blends such as R-407C and R-410A.

- **R-417A:** R-417A, with a GWP of ~1,955, is composed of HFC-134a, HFC-125, and HC-600 (butane). This zeotropic blend has primarily been promoted as a drop-in and retrofit refrigerant for HCFC-22 in air conditioning and refrigeration applications.

- **Hydrocarbons:** While it has been reported that hydrocarbon blends such as HC-290, HC-1270 and HC-290/HC-170 have been used drop-in replacements for HCFC-22 in a few locations, the future use of hydrocarbon refrigerants in the air-conditioning sector will largely depend on the added costs of safety mitigation technologies. Compared to HFCs, hydrocarbon refrigerants offer reduced charge levels (approximately 0.10 - 0.15kg/kW of cooling capacity), miscibility with mineral oils (synthetic lubricants are not required), reduced compressor discharge temperatures, and improved heat transfer due to favourable thermo-physical properties. However, using hydrocarbon refrigerants in air conditioning systems also presents challenges, including safety concerns and difficulties with handling, installation practices, and field service skills and practices. (UNEP 2007d).

- **Carbon dioxide (R-744):** While R-744-based air conditioners have not been introduced into the market yet and it is not expected to play a significant role in the replacement of HCFC-22 in air conditioning applications in the immediate future, the UNEP RTOC report (2007d) indicates that a number of compressor manufacturers have active R&D programs for R-744 compressors. R-744 offers a number of desirable properties as a refrigerant: readily available, low GWP and low cost. R-744 systems are also likely to be very compact; though not necessarily lower cost than HCFC-22 systems. These desirable characteristics are offset by the fact that R-744 air conditioning systems can have low operating efficiencies and very high operating pressures. It is also anticipated that the cost of CO_2 air conditioning will be significantly more than conventional systems (up to 30% more than HCFC-22 systems), due to modifications that are required to improve safety (ADL 2002, IPCC/TEAP 2005, Sand et al. 1997)

In addition to these alternative refrigerants, a number of other non-ODS technologies—such as absorption, desiccant cooling systems, stirling systems, and thermoelectric systems—were previously presented as options that could have a positive impact on the phase-out of ODS in air-conditioning equipment. However, industry input and literature survey indicates that these technologies have not progressed much closer to commercial viability for air conditioning applications. While these alternative systems are theoretically feasible, it is highly unlikely that they will penetrate Article 5 markets in the next decade. (UNEP 2007d)

Exhibit 33 presents a summary of the energy consumption and LCCP of actual and potential alternative refrigerants in unitary and window AC units relative to HCFC-22, based on published data.

Exhibit 33: Relative Energy Consumption and LCCP of Alternative Refrigerants in Unitary and Window AC Relative to HCFC-22

Alternative Refrigerant	Energy Consumption[a] (Source)	LCCP (Source)
Unitary AC		
R-134a	+5% to +10% (Sand et al 1997)	-1% (ADL 2002)
R-407C	Similar (Sand et al 1997, ADL 2002)	Similar (ADL 2002)
R-410A	-4% to -7% (Sand et al 1997)	Similar (Minor 2004)
CO_2	Similar (ADL 2002)	Slight reductions (IPCC/TEAP 2005)
R-290	+12% to +23% (Goetzler and Dieckmann 2001, Sand et al. 1997)	-3% to -8% (ADL 2002)
Window AC		
R-134a	Greater (Hundy and Pham 2001)	-
R-407C	0% to +5% (Minor 2004)	Similar (Minor 2004)
R-410A	0% to -7% (Calm and Domanski 2004, Minor 2004)	-
R-290	Similar (Hickman 2004)	-

- = No information available

[a] Positive energy consumption indicates that the alternative refrigerant consumes more energy than the baseline refrigerant.

5.3 Projected Transitions

Commercialized products using HFC refrigerants are available in most non-Article 5 countries. In addition, climate-friendly products that utilize HC refrigerants are available to a limited extent in some product categories, such as portable air conditioners. The widespread availability of these technologies in non-Article 5 countries should provide optimism that the technologies will be cost effective and readily available in Article 5 countries in the next decade. In addition, some ODS alternatives have begun to penetrate Article 5 markets, including China and South Africa.

However, given the low price of HCFC-22 equipment, it is anticipated that most small and large AC equipment sold in Article 5 countries will continue to utilize HCFC-22 for the foreseeable future, within the limits imposed by the cap on consumption that enters into force in 2016. An accelerated phaseout of HCFCs in Article 5 countries could change this.

Exhibit 34 presents the projected overall market growth rates in the short- and long-terms for small and large AC equipment by Article 5 region. Short-term growth rates were based on:

- *Latin America/Caribbean*: weighted average of the projected growth rates from 2007-2010 for Argentina, Brazil, Colombia, Mexico, and Venezuela (UNDP 2007).
- *Middle East/North Africa*: weighted average of the growth rates in Lebanon and Iran (UNDP 2007).
- *Asia*: growth rates in China, India, and Indonesia (Han 2007, UNDP 2007, ICF 2007).
- *Africa*: growth rates based on industry information (ICF 2007) and the projected growth rate for South Africa (Manikela 2007).

Long term (2010-2040) growth rates in small air conditioning systems were assumed to be half as much as the short term, due to fluctuations in economic growth and increasing market saturation.

Exhibit 34: Projected Market Growth by Region

Timeframe	Asia	Latin America/ Caribbean	Middle East/ North Africa	Africa
Small AC				
2007-2009	10%[a]	9%	9%	6%
2010-2040	5%	4%	4%	3%
Large AC				
2007-2009	10%[a]	3%	3%	3%
2010-2040	3%	3%	3%	2%

Source: UNDP (2007), Manikela (2007), Han (2007), ICF (2007).
[a] While a 10% growth rate for the region is projected, actual growth may be significantly higher in certain countries, such as China and India. For example, because the urbanization level in China may reach 45% in 2010, considerable demand may be created for upgraded residences in that country (Han 2007). Similarly in India, domestic industry sources project that the compound annual growth rate in the short-term may be as high as 23% for small AC and 17% for large AC (ICF 2007).

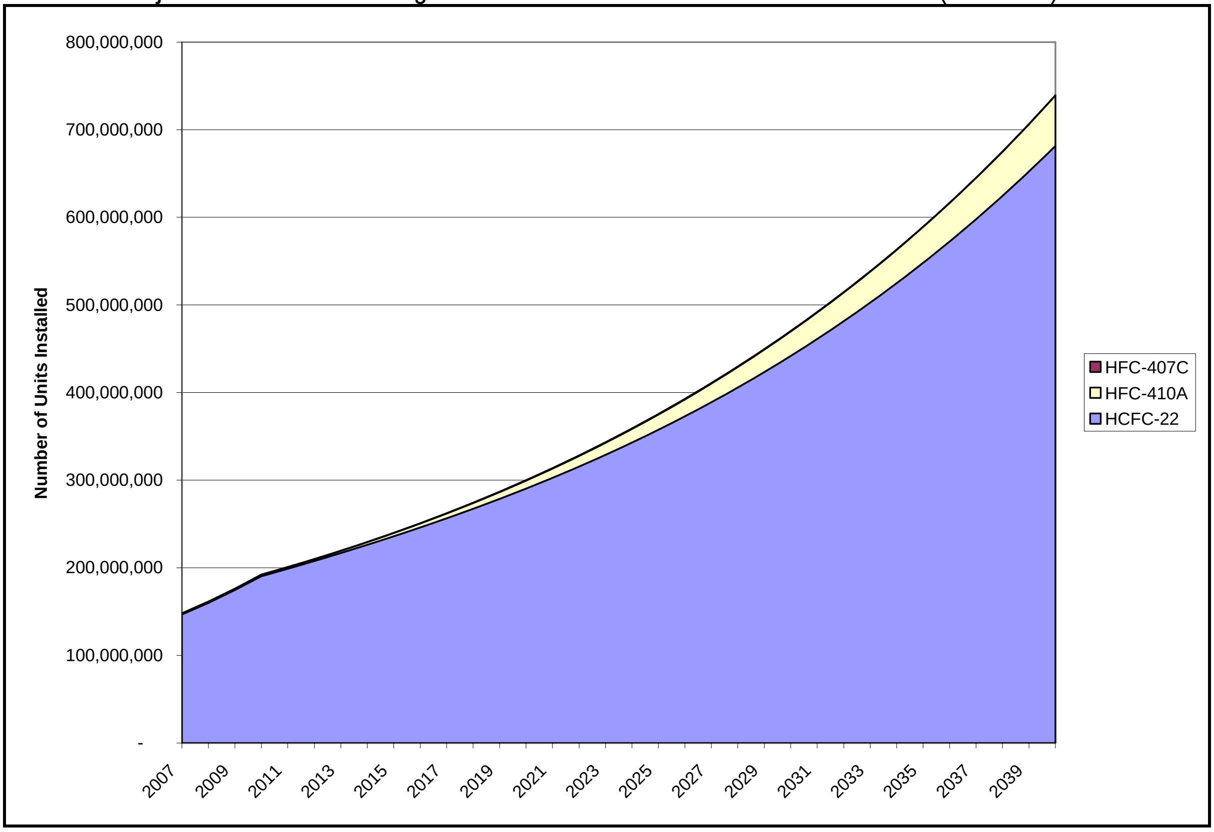
Because no significant number of retrofits is assumed to occur in the future, the transition to alternative refrigerants in AC equipment will occur as equipment manufacturers offer different refrigerants in new equipment in response to political and economic constraints. Based on industry consultations, current and future equipment sales by refrigerant type were projected through 2040. Assumptions used in developing these projections are as follows:

- Current market penetration of refrigerants remains constant until 2010 (i.e., 99% R-22, 0.75% R-410A, and 0.25% R-407C) in all Article 5 regions.
- In 2010, a slight, gradual shift towards increasing sales of HFC-containing equipment is projected to occur, as a result of the U.S. HCFC phaseout (which is expected to ban the import of pre-charged AC equipment), which will in turn compel A5 manufacturers to further transition their AC production away from R-22 to satisfy demand in export markets. Specifically, it is projected that the market share of R-22 in newly manufactured equipment will decline from 99% in 2010 to 90% in 2020.[14] Meanwhile, it is projected that the market share of R-410A will gradually increase from less than 1% in 2010 to 10% in 2020. R-407C is assumed to drop out of the market in 2010, as it is less efficient than R-410A.
- From 2020 to 2040, the market penetration of refrigerants into new equipment is projected to remain constant (at 90% R-22 and 10% R-410A).

Applying these assumptions on equipment retirement, market growth, and anticipated penetration of refrigerants into new equipment, Exhibit 35 presents the refrigerant transition for all A5 countries in small and large AC equipment in terms of the installed bank. More detailed results on the estimated stocks by equipment type and region are presented in Appendix 3.

[14] This analysis does not attempt to project how individual A5 countries will meet the HCFC consumption/production cap in 2016; given that use of HCFC-22 in small AC equipment was among the last HCFCs/equipment types to be phased out in many non-A5 countries (in order to meet phaseout targets), this analysis assume that use of HCFC-22 in AC equipment will be unconstrained in A5 countries until 2040.

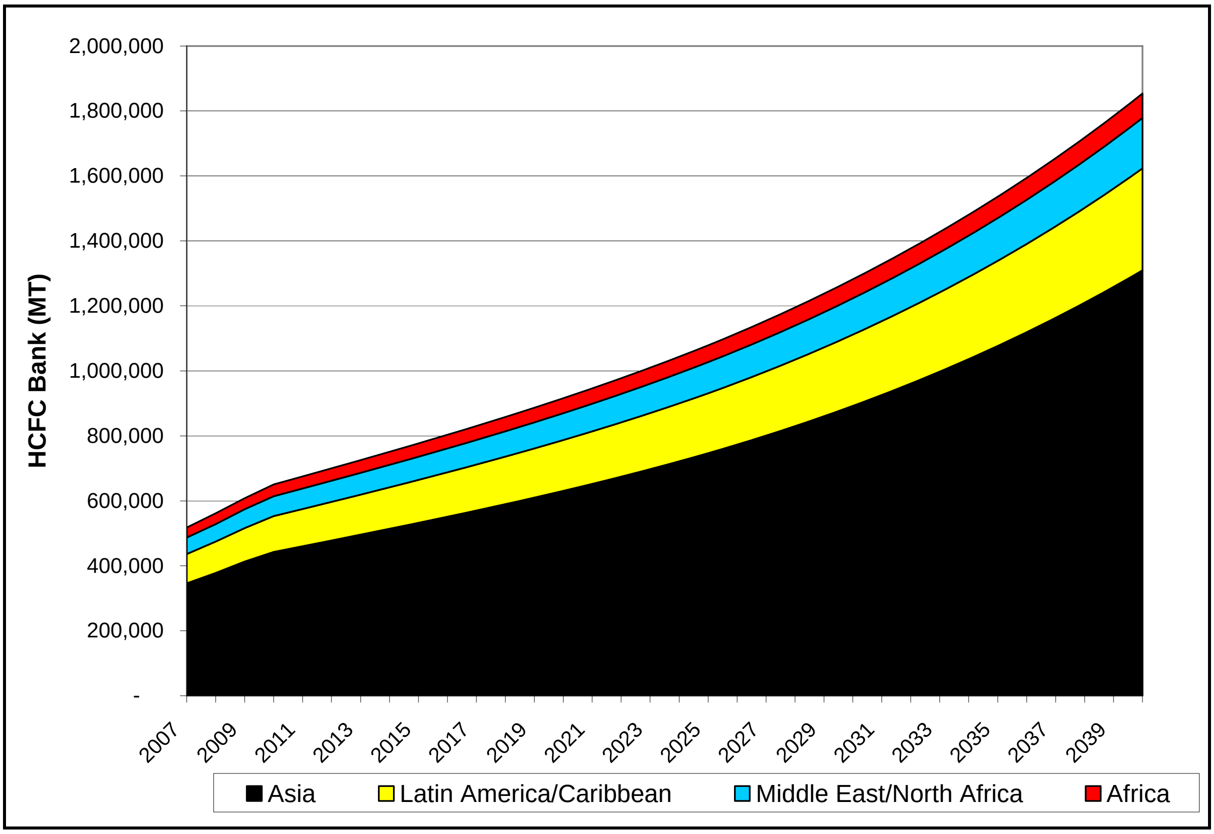
Exhibit 35: Projected Transition of Refrigerant Stock in Installed AC Units in A5 Countries (2007-2040)



6. Summary of Results and Considerations for HCFC Phaseout

Based on information from recently published reports and key industry representatives, this report developed estimates of the current and future stocks of chillers and AC equipment in Article 5 regions under a business-as-usual scenario. The findings of the analysis indicate that the current installed base of CFCs in Article 5 countries, primarily contained in centrifugal chillers, will decline and reach full phase out by 2025. Meanwhile, HCFCs banks will continue to rise. As shown in Exhibit 36, the installed base of HCFCs in Article 5 countries will grow from nearly 518,250 MT in 2007 to more than 776,800 MT in 2015, nearly all of which will be HCFC-22. By 2040, this installed base of HCFCs in AC equipment will reach 1,853,700 MT; Asia, led by China, is projected to account for more than 70% of this amount.

Exhibit 36: Projected HCFC Bank in Chillers/ AC Equipment in Article 5 Countries (2007-2040)



- **Centrifugal Chillers:** The total bank of HCFCs currently installed in centrifugal chillers in Article 5 countries is estimated to be 9,100 MT, 85% of which is composed of R-123 and the rest by R-22. The total bank of CFCs is estimated to be 6,900 MT. Around 60% of the bank is installed in Asia, 20% is in the Middle East/North Africa, 15% is in Asia; and the rest is installed in Africa. Market trends indicate that this sector will continue to grow rapidly in the near future, driven by growth in China and the Middle East.

  The majority of the current bank is expected to be phased out through replacement—not retrofit—activity, as old equipment is retired. R-134a is and will remain the dominant refrigerant used in new centrifugal chillers, although R-123 captures 25% of the market. Given the costs involved in commercializing alternatives, it is unlikely that manufacturers will pursue the development of any other alternatives to replace these refrigerants—unless there is a regulatory imperative to do so, which there currently is not.

- **Positive Displacement Chillers:** The total bank of HCFCs currently installed in positive displacement chillers in Article 5 countries is estimated to be 164,000 MT, all of which is composed of R-22. Of this, screw and scroll chillers account for 156,400 MT and reciprocating chillers account for 8,900 MT. 80% of the total bank is installed in Asia, 11% in Middle East/North Africa, and 9% in Latin America/Caribbean; the rest of Africa accounts for less than 1% of the current bank. Market trends indicate that the future market for screw and scroll chillers will remain strong, while markets for reciprocating chillers will decrease.

R-134a, which currently accounts for approximately 15-20% of all positive displacement chiller sales, will be the dominant refrigerant installed in new units by 2020—capturing 80% of the screw chiller market and 20% of the scroll chiller market. The remainder of the screw chiller market is projected to use R-22, while the remainder of the scroll chiller market is projected to use R-410A (50%) and R-22 (30%). Due to cost and efficiency constraints, retrofits are not expected to play a significant role in the transition away from HCFCs in this end use.

- **Small and Large Air Conditioning:** The total bank of HCFCs currently installed in small and large AC equipment is estimated to be 343,800 MT, nearly all of which is composed of R-22. Around 60% of this bank is installed in Asia, 20% in Latin America/Caribbean, with the remainder split between the Middle East/North Africa and Africa. This end use is expected to experience significant growth in the next few years across all Article 5 regions, especially the small AC segment.

  R-22 is expected to continue dominating this sector in future. A slight shift towards R-410A is anticipated from 2010 onwards, when the U.S. bans imports of equipment pre-charged with R-22. Availability of R-410A and R-407C based AC equipment in Article 5 regions that manufacture equipment for export may promote the penetration of these alternatives. However, without an accelerated phaseout, the transition away from HCFCs in this sector will be slow.

6.1 Market Drivers

Only regulatory drivers are likely to force the transition away from HCFCs in A5 countries to occur faster than projected in Exhibit 36. Simply stated, manufacturers will avoid incurring the capital costs and down-time associated with plant conversion as long as possible, even though the annual costs associated with the transition (i.e., refrigerant and component prices) will not vary significantly once economies of scales are reached. Current market drivers will not promote a shift away from ODS, as explained further below.

Currently, the price of R-22 in China is $1.32/kg, while that of R-410A is $13.18/kg, and that of R-407C is $10.30/kg (UNEP 2007a). With no technical reasons to compel the switch to alternative refrigerants (e.g., significant efficiency improvements), these prices send clear signals to A5 equipment manufacturers to continue to rely on R-22. This is especially true given the intensely competitive nature of the AC market, with AC manufacturers facing market pressure associated with rising production and marketing costs, the implementation of new energy efficiency standards, and shrinking profits (China Daily 2005). Thus, while A5 countries export AC equipment containing R-407C and R-410A to non-A5 markets (e.g., Europe, Japan, U.S., Australia), market signals dictate that it continue using R-22 in new equipment sold in A5 markets.

Further, because of the financial incentives provided by the Kyoto Protocol's Clean Development Mechanism (CDM) for the production of HCFC-22 (and capture of HFC-23), a large, steady supply of R-22 for use in new equipment, as well for the servicing of existing equipment, is guaranteed until 2012.

Indeed, the accessibility and affordability of refrigerants is critical for the servicing sector in A5 countries. Similarly, the servicing sector requires access to the AC equipment components; thus, to the extent that HFC refrigerants will require different materials and parts, the after-market will require that they be made available, at affordable prices. In short, the availability and affordability of HFC refrigerants and their associated components will be critical not only to compel manufacturers to adopt ozone-friendly alternatives in the new equipment they produce, but also to compel consumers to choose that alternative equipment—and to ensure a well-functioning after-service market. This will be particularly critical after 2040 (under the current phaseout schedule for HCFCs), as HCFCs will become scarce and servicing needs for HCFC equipment will have to be met through recovered and reclaimed sources. To the extent that natural refrigerants can earn a larger market share over time, this will reduce dependence on HFCs as the market leader for transition, and will reduce demand for reclaimed HCFCs in non-essential sectors. A strong regulatory push away from HFCs with high global warming potentials (GWPs) in the future would trigger the intensified development and use of natural refrigerants (beyond that projected in this analysis).

Refrigerant price trends will also change because of availability. As the global phaseout of HCFC-22 in non-Article 5 countries reduces global supply of virgin R-22, quantities in Article 5 countries may also decline slightly, which would in turn cause prices to rise. In addition, the financial incentives to produce HCFC-22 under the CDM may no longer be in play beyond 2012. Meanwhile, R-410A, which is under patent until 2009, will drop in price once the patent expires, and once it begins to be produced at economies of scale in non-A5 countries (i.e., when R-22 is banned).

Further, as the HCFC phaseout progresses in non-A5 countries, global demand for HCFCs and other ozone-friendly alternatives will rise (e.g., in response to the expected US ban on the import of pre-charged products containing R-22 in 2010). These changes may cause a shift in refrigerant pricing structures over time and, potentially, provide a market signal to Article 5 countries to invest in manufacturing facilities that produce equipment and products without HCFCs. Such investments for alternative product lines may cause Article 5 countries, such as China, to produce the same products for domestic consumption as well, if economies of scale can be achieved.

Should economies of scale be reached, the overall costs to produce R-410A units will be similar to those of producing R-22 units, even though different components will be needed. In particular, R-410A units will require superior design to account for the higher pressure refrigerant, including tighter joints and better seals, but they will also require smaller (lower cost) compressors, so these costs will offset to some degree. Actual component costs will vary based on the location of suppliers, volumes purchased, and other factors (ICF 2007)

Under the current schedule, the shift to non-ODS alternatives in A5 countries will occur slowly. It will take years, if not decades, before equipment based on HFCs and other refrigerants become more readily available at truly competitive prices, and for equipment manufacturers to acquire the necessary capital investment in the form of factory tooling, sub-product design, and networks of suppliers of components, as described in more detail below.

6.2 Costs and Barriers Associated with HCFC Phaseout

Whenever the transition away from HCFCs in the AC sector occurs in A5 countries, there will be costs associated with the replacement of AC installations (i.e., large tonnage chillers), as well as the conversion of manufacturing facilities that produce HCFC-containing AC equipment.

6.2.1 Chiller Equipment Replacement

Given the large stocks of large tonnage HCFC chillers that are projected to be installed in A5 countries (see Exhibit 37), in addition to the long lifetime and high investment cost of such equipment, HCFC chillers are likely to remain in use for many more decades *beyond* 2040.

Exhibit 37. Projected Number of HCFC Centrifugal Chillers Installed in A5 Countries (2007-2040)

Year	2007	2010	2015	2020	2030	2040
HCFC-123	17,330	20,920	24,490	28,690	39,580	55,190
HCFC-22	2,940	3,320	2,810	2,370	1,690	1,200
Total	20,270	24,240	27,300	31,060	41,270	56,390

In Article 5 countries, the average cost of a centrifugal chiller is roughly $140,000 (GTZ 2006, BSRIA 2007, ICF 2007). Based on this estimate, the information on number of units provided in Exhibit 37, and an assumed average equipment lifetime of 30 years, the cost of early retirement in 2020—assuming 100% of units are immediately retired in 2020—is approximately $1.6 billion at a 7% discount rate (or $2.1 billion at a 5% discount rate); in 2030, the estimated cost of early retirement is estimated at $1.1 billion at a 7% discount rate (or $1.7 billion at a 5% discount rate).

6.2.2 Conversion of AC Manufacturing Facilities

The total costs for converting chiller/AC manufacturing facilities to use non-HCFC refrigerants will largely depend on the total number and production capacity of manufacturing plants in Article 5 countries. At the facility-level, the cost can vary widely based on specific equipment type and the volume of refrigerant used.

For example, to rebuild a 500,000-unit product line of R-22-based window AC units to produce R-410A units, UNEP (2007a) estimates that it will cost roughly US$100,000. Industry research indicates, however, that this is a low-end conversion cost that could likely only be realized if the HCFC-based plant already produces a limited amount of HFC-based equipment; such that investment would only be required to switch the charging station to HFCs. In some places, this type of dual production may already be underway; for example, China is currently producing HCFC-based equipment for certain markets, and may have parallel production lines in the same manufacturing facilities that produce HFC-based equipment for other markets. However, if HFC technology is not already integrated into the production facility, an HCFC-based plant would require upwards of US$6 million to cover the cost of technology transfer, other research and development, retooling, and other conversion costs. Similar costs may be expected to convert manufacturing plants that produce other types of equipment with equivalent output. For example, for a plant that produces 3,000 chillers per year with average capacity of 3,500 kW, it would cost around US$6 million to convert from HCFCs to HFCs. (ICF 2007)

In addition to the capital cost of conversion, incremental operating costs will also be incurred in the form of higher incremental refrigerant costs and component costs. For window AC units, for example, the cost of R-410A is greater than that of R-22, and higher component costs (up to $5/unit) are associated with the use of thicker walled copper tubing, newly developed compressors, and other components needed to withstand the high pressures of R-410A (Actrol 2007, ICF 2007).

6.3 Policy Implications

The findings of this analysis indicate that in the absence of stronger regulatory drivers in Article 5 countries, the use of HCFC in chillers, and especially in other AC equipment, will continue to rapidly increase in the coming years. Due to the pervasive use of R-22, a large inventory will likely remain in service long after production is scheduled for phaseout in 2040. This build-up will lead to a surge in ODS emissions from equipment leakage, servicing, and disposal. Accelerating the phaseout of HCFCs in Article 5 countries could reduce this deepened reliance on R-22 and avoid emissions of ODS that could delay the recovery of the ozone layer. Programs that provide an economic incentive to replace older equipment, coupled with technical assistance programs that highlight the energy efficiency gains from replacing older ODS equipment, can help redirect this path.

Appendix 1 –Questionnaire for Key Government and Industry Contacts

Questionnaires were tailored to industry contacts, associations, and government representatives based on their areas of expertise (in terms of equipment types and regional coverage). The questionnaire presented below is a sample questionnaire sent to the National Ozone Unit in South Africa.

[Sample] Questionnaire on the Chiller/AC Markets in South Africa

Part I: Chillers

1. What percent of all chillers in use in Africa (excluding North Africa) are found in South Africa?
2. What is the estimated total number of centrifugal and positive displacement chillers currently in use in South Africa?

Current Chiller Stock by Type

Chiller Type	South Africa
Centrifugal	
Positive Displacement Chillers	
Screw & Scroll	
Reciprocating	

3. What is the current market growth rate for chillers in South Africa? What do you project will be the growth rate from 2010-2015?
4. How do you expect the chiller market to grow in the rest of Africa (excluding North Africa)?
5. From where does South Africa import most of its centrifugal chillers? What about positive displacement chillers?
6. What is the average capacity (kW) of centrifugal chillers used in South Africa? What about the average capacity (kW) of positive displacement chillers?
7. Does the cost of chiller equipment sold in South Africa vary significantly by refrigerant type?

Part II: Residential and Commercial Air Conditioning

NOTE: Residential and commercial AC is assumed to include small self contained AC systems; non-ducted split residential and commercial AC systems; ducted, split residential AC systems; and ducted commercial split and packaged AC systems. For the purposes of this analysis, AC equipment is grouped into two general categories: (1) small AC, with an average charge size of 2 kg; and (2) large AC, with an average charge size of 10 kg.

8. From where does South Africa import most of its small and large AC equipment?
9. What percent of all residential/commercial AC equipment in use in Africa (excluding North Africa) is found in South Africa?
10. Can you estimate current stocks of small and large AC equipment in use in South Africa?

Existing AC Equipment Stock by Type (2007)

AC Equipment Type	Number of Units in South Africa
Small (average 2 kg charge size)	
Large (average 10 kg charge size)	

11. What is the current market growth rate for small and large AC equipment in South Africa? What do you project these market growth rates to be from 2010-2015?
12. What are the primary refrigerants in use in current stocks of AC equipment today, and how do you expect that mix of gases to change between now and 2020? For example, do you expect the phaseout of HCFC-22 in developed countries to influence the types of refrigerant used in newly manufactured equipment sold in South Africa?
13. What is the average cost of small and large AC equipment sold in South Africa?

Appendix 2 – List of Major Chiller and AC Manufacturers

Exhibit: Major Chiller and AC Manufacturers

Company	Headquarter Country
Advance Cool Technology Co., Ltd.	Thailand
Aermec	Italy
Bharat Refrigerations Pvt. Ltd	India
Blue Box	Italy
Blue Star	India
C&D International	China
Carrier	US
Chigo	China
Ciat	France
Climaveneta	Italy
Clivet	Italy
Daikin/McQuay	Japan/US
Danfoss	Denmark
Dunham-Bush Inc	Malaysia
Emicon	Italy
Ferroli	Italy
Fujitsu-General	Japan
Gree Air Conditioners	China
Guangdong Kelon Electrical Holdings Co Ltd	China
Haier	China
HCF-Lennox	France
HITSA	Spain
Hstars Group	China
LG Electronics Ltd.	South Korea
Midea	China
Mitsubishi	Japan
Rhoss	Italy
Samsung	Korea
Teba	Turkey
Trane	US
Weeseng HVAC Technology Pte Ltd	Singapore
York (JCI)	US
Zamil	Saudi Arabia
Zhongshan Asiatic Electric Co. Ltd	China

Appendix 3 – Detailed Results Tables

Exhibit 38 through Exhibit 42 present detailed results of projected stock through 2040 by equipment type, refrigerant type, and A5 region.

Exhibit 38: Projected Stock of Centrifugal Chillers by Refrigerant and Article 5 Region (Units)
